a mile in circuit, was much stronger and more compact than the lower; but neither the upper nor the lower had a ditch on the ride of the river. This ancient capital has been suffered to sink into ruins, since the recent foundation of Ummerapoora. "The walls," says Colonel Symes, "are now mouldering into decay; ivy clings to the ridge; and the earth has been suffered to fall in from the bottom, undermine the foundations, and have already caused large clayhams in the different faces of the fort. The materials of the houses, consisting chiefly of wood, had, on the first order for removing, been transported to the new city of Ummerapoora; but the ground, which is where it is covered with bushes, or rank grass, still retains traces of former buildings and streets. The lines of the royal palace of the Lotoo, or grand council hall, the apartments of the women, and the spot on which the piash, or imperial spire, had flood, were pointed out to us by our guide. Clumps of bamboo, a few plantain trees, and tall thorns, occupy the greater part of the area of this lately flourishing capital. We observed two dwelling-houses of brick and mortar, the roofs of which had fallen, and their guide said, he had belonged to Colars, or foreigners; on entering one, we found it inhabited only by two chief men, who flew in our faces, whilst two legs of feeding were afforded by their fish, and by the pineapple miller that hung upon the walls. Numerous temples, on which the Birman never lay faeculigious hands, were dilapidated by time. It is impossible to draw a more striking picture of devastation and ruin." To the gloomy and deflected walls of Ava, a fine contrail is exhibited by the new city of Ummerapoora.

A V A, River of, now called Irracaddyi, is the chief river of the Birman empire; according to major Remell (Memoir, p. 298.), it is the Non-Kian, little, if at all, inferior to the Ganges, and it runs to the fourth from that angle of Yunnan which approaches nearest to Bengal. It is said to be navigable from the city of Ava to Yunnan; it passes by Moguand to Bammoo, and thence to Ummerapoora and Chagain, and thence to Prome towards the sea, into which it discharges itself by many mouths, after a comparative course of near 1200 British miles. The two extreme branches of the Ava river are the Persian and Syriam rivers, which major Remell (Mem. p. 33.) has been able to trace to the place where they separate from the main river, at about 150 geographical miles from the sea. The bearings of these two branches intersect each other at an angle of about sixty degrees. The mouths of the Ava river form an amphitheatre of low islands like those of the Ganges. M. D'Anville erroneously supposed the Sampoo, Thibet river, or Burmanpootar, to be the same with that which is called, in the lowest part of its course, the river of Ava: and the Nou-Kian he supposed to be the same with the river of Pegu. This river of Pegu, according to Buchanan (see Symes's Embassy, vol. ii. p. 412.), which is supposed to come from China, rises among hills about 150 miles from the sea, which form the boundary between the Birman and Pegu kingdoms. The river coming from Thibet, supposed to be that of Arracan, it is really the Keendum, or the great western branch of the Ava river. That which is supposed to be the western branch of the Irrawaddy, is in fact the eastern one, which passes by Ava, and runs to the north, keeping west from the province of Yunnan, and leaving between it and that part of China a country subject to the Birmans. He adds, that between the Pegu and Martaban rivers there is a lake from which two rivers proceed: the one runs north to Old Ava, where it joins the Myoungnyin, a little river of Ava, which comes from mountains on the frontiers of China; the other river runs south from the lake to the sea, and is called Sitang. The country bordering on the Ava river, from the sea to Lundaye, is flat, and the foil rich, and resembles the lower parts of the courses of the Ganges, Indus, and other capital rivers, formed out of the road deposited by the inundations of the river. This low tract is called Poyou. Renneli's Mem. p. 297. Symes's Embassy to Ava, vol. ii. p. 413.

A V A, in Botany, a plant so called by the inhabitants of Otaheite, in the South Sea, from the leaves of which they extract an intoxicating juice. It is drunk very freely by the chiefs and other considerable persons, who, with each other in drinking the greatest number of draughts, each draught being about a pint: but it is carefully kept from their women. Hawkeworth's Voyages, vol. ii. p. 200.

A V A D I E S, in Ancient Geography, a people of Asia, placed by Ptolemy in Bactria.

A VA D O U T A S, a foot of Indian brann, distinguished by their authority and abstinence, and depending on accidental benefice for their necessaries.

A V A L L of Marriage, in Scotch Laws, denotes that custom in ward-holding, by which the superior was entitled to a certain sum from his vassal, upon his attaining the age of puberty, as the value or yield of his vassal.

A V A I L L E, in Geography, a town of France, in the department of the Vienne, and chief place of a canton in the district of Civray; five leagues east of Civray, and six and a half S.S.W. of Montmorillon. The place contains 2115, and the canton 5154 inhabitants: the territory includes 2125 kilometres and 4 communes.

A V A L, the largest of the islands in the gulf of Persia, known to the Europeans by the name of Bahrein. In this island were once 360 towns and villages; but at present it contains, besides Bahrein the capital, only fifty wretched villages; the others having been ruined by a long series of wars. This island produces great abundance of dates; but its chief dependence is upon the pearl-fishery, as the best pearls are supplied by it. The duties upon the two articles of dates and pearls affords its sovereign a lack of rupees, out of which he is obliged to maintain a garrison in the city.

A V A L A N C H E S, a name given in Switzerland and Savoy to those prodigious masses of snow, which are precipitated, with a noise like thunder, and in large torrents, from the mountains, and which destroy everything in their course, and have sometimes overwhelmed even whole villages. In 1719, an avalanche from a neighbouring glacier overspread the greater part of the houses and baths at Leuk, and destroyed a considerable number of inhabitants. The best preservative against their effects being the forests, with which the Alps abound; there is feared a village situated at foot of a mountain, that is not sheltered by trees; which the inhabitants prefer with uncommon reverence. Thus, what constitutes one of the principal beauties of the country, affords also security to the people.

Our readers may be gratified by the description which Thomson has given of the avalanches in his "Scenes:

"Among these hilly regions, where embraced
In peaceful vales, the happy Grisons dwell;
Oft, rushing fudden from the loaded cliffs,
Mountains of snow their gathering terrors roll
From steep to steep, loud thuddring down they come,
A wintry wale in dire commotion all;
And herds and flocks, and travellers and swains,
And sometimes whole brigades of marching troops,
Or hamlets sleeping in the dead of night,
Are deep beneath the smothering ruin hurl'd."

A V A L A S, a town of Servia, twelve miles south of Belgrade.

A V A L I T E S S I N S, in Ancient Geography, a gulf on the
the right of the Erythrean sea. In this gulf was a sea-port, called Avalis, on the coast of Ethiopia: the people of Ethiopia who lived near this gulf were called Alvatis, and Abatis, or Albius.

AVALLON, in Geography, a town of France, in the department of the Yonne, and principal place of a district, seated on the river Conin. This is a town of considerable trade in grain, wine, and cattle, with a cloth manufactury; twenty-three miles S.S.W. from Auxerre, and fifty-fourth of Troyes. The place contains 50,035, and the canton 9,668, inhabitants: the territory includes 17,555 square miles and 11 communes. N. lat. 47° 29', E. long. 3° 5'.

AVALON, a peninsula of the island of Newfoundland, not far from the south-east part of it, with Placentia bay on the south, and Trinity bay on the north.

AVANCAY, a jurisdiction in the diocese of Cueno, in South America, lying north-east of the city of Cueno, and extending above thirty leagues. The climate is variable, but in general hot, and many parts of it are cultivated with success, which yield a very rich harvest. The more temperate parts are forested, in which, native and fruit, which are sent to the city of Cueno. In this province is the valley of Xaquijagua, or Xajaguana, where Gonzalo Pizarro was defeated and taken prisoner by Pedro de la Gasco.

AVANCHE. See Avesche.

AVANIA, in the Turks' Legislation, a fine for crimes, and on deaths, paid to the governor of the place. In the places where several nations live together under a Turkish governor, he takes this profitable method of punishing all crimes among the Christians or Jews, unless it be the murder of a Turk. Of cucumber's fig. vol. ii. part ii. p. 30.

AVANT, a French proposition, signifying before, or any priority either in respect of time or place; sometimes used in composition in our language, but more usually contracted, and wrote vanta, or vant, or even van.

AVANT-PASSY, &c. See Van-Passy.

AVANT-GUARD, &c. See Van Guard.

AVANTICICI, in Ancient Geography, a people reckoned among the inhabitants of the Alps, and, according to Pliny, comprehended by Galba within the province called Narbonensis. Some have represented them as the inhabitants of Avanticum or Aventicum, the capital of Helvetia; but as Gaul Narbonensis never extended so far, Hardouin rejects this opinion. Mauzer (Mem de litter. t. xxxix. p. 248.) fixes them in a place, now called Avanos, between Gap and Embrun.

AVANTURINE, in Natural History, a yellowish stone full of sparkles, resembling gold, very common in France. An artificial imitation is made of it by mixing sparkles of copper with glafs, which is sold for emeralds, and to sprinkle as food upon writing. Various stones have been known by this appellation. See Quartz, and Pelas.

AVIAOU, in Ethnology, the name given by the natives of Othaebe to a species of Gobin figured by Brossinnet in his decade of fishes. See Gobius Ocellaris.

AVARA, or Avera, in Ancient Geography, a river of Gaul, which passes by the town of Avaricum.

AVARY, in Geography, a town of France, in the department of the Loir and Céor, and chief place of a canton in the district of Mer, 52 miles N.E. of Blois.

AUARCAVELICA. See Guamanza.

AVARES, or Avari, a tribe of Sarmatian origin, denoting far distant, and formerly applied to a chief of the inhabitants of the southern part of Russia, from thence dwelling farther to the east than any of the Sarmatian tribes.

In the differentiation of M. Peyronnel on the origin of the Slavonian language, we are informed that the slaves, who possessed Macedonia, Greece, and Epirus, were also called Avar or Avalis; and that they were unknown to the inhabitants of Constantinople till the end of the reign of Justinian. At this time, the Emperor Justinian, sent under the character of an ambassador to their camp at the foot of mount Caucasus. They numbered 356; their ambassadors addressed the Roman emperor who admitted them to an audience, as they represented the right of the possession of the most populous of nations, the invincible, the irresistible Avari. Their friendship was purchased by the timely emperor, and Volkanin, one of the emperor's guards, was sent under the character of an ambassador to their camp at the foot of mount Caucasus. He persuaded them to invade the enemies of Rome. These fugitives, who had fled before the Turkish armies, passed the Danube and Borythenes, and hastily advanced into the heart of Poland and Germany, violating the law of nations and abounding the rights of victory. Before ten years had elapsed, their camps were fixed on the Danube, and the Elbe, many Bulgarians and Slavonian names were obliterated from the earth, and the remnants of their tribes are found, at tributaries and vassals, under the standard of the Avari. The Chagan, by which appellation their king was distinguished, ill affected to cultivate the friendship of the emperor; and Justinian entertained some thoughts of fixing them in Pannonia, to balance the prevailing power of the Lombards. But the virtues of teaching of an Avari betrayed the secret enmity and ambitions of their countrymen; and they daily complained of the weakness, the paltry policy of detaining their ambassadors, and denying the arms which they had been allowed to purchase in the capital of the empire. An embassy that was received about this time from the conquerors of the Avari, might possibly have produced an apparent change in the disposition of the empresses. The Turkish ambassadors having pursued the footsteps of the vanquished to the Balk, the Volga, mount Caucasus, the Euxine, and Constantinople, in length appeared before the successor of Constantine, to request that he would not enforce the cause of rebels and fugitives. In consequence of this embassy, the emperor renounced, or seemed to renounce the Avari, and accepted the alliance of the Turks. In the year 566, Justinian II. gave audience to the ambassadors of the Avari, and the scene was decorated to impress the barbarians with astonishment, veneration, and terror. After the first emotions of surprise, the chief of the embassy extolled the greatness of the Chagan, by whose clemency the kingdoms of the south were permitted to exist, whose victorious subjects had traversed the frozen rivers of Scythia, and who now covered the banks of the Danube with immovable troops. It was also alleged, that the late emperor had cultivated, with annual and costly gifts, the friendship of a grateful monarch, and that the enemies of Rome had received the allies of the Avari. The same prudence, it was intimated, would inflame the nephew of Justinian to imitate the liberality of his uncle, and to purchase the blessings of peace from the powerful people who were enlightened and excelled in the exercise of war. To this address the emperor replied in the same strain of haughty defiance: and he derived the confidence from the God of the Christians, the ancient glory of Rome, and the recent triumphs of Justinian. The Chagan was awed by the report of his ambassadors; and instead of exercising his threats against the eastern empire, he marched into the poor and savage countries of Germany, which were subject to the dominion of the Franks; but after two doubtful battles, his confederate was compelled to retire. The spirit of the Avari was chilled by repeated disappointments, their power would have dissolved away in the Sarmatian desert, if the alliance of Alboin, king of the Lombards, had not given a new object to their arms, and a lasting settlement to their wearied fortunes. (See Alboin, and Lombards.) By the departure,
departure of the Lombards, and the ruin of the Gepidæ, between the years 570 and 622, the balance of power was destroyed on the Danube; and the Avars, at this time, spread their permanent dominion from the foot of the Alps to the Bosporus. The reign of Baian is the brightest area of their monarchy; and the Chagans, who occupied the rutile præst of Attila appear to have imitated his character and policy. The pride of Justin II., of Tiberius, and of Maurice, was humbled by a proud barbarian, more prompt to insult, than exposed to suffer, the injuries of war; and as often as Asia was threatened by the Persian arms, Europe was oppressed by the dangerous insults, or costly friendship, of the Avars. As the successor of the Lombards, the Chagan asserted his claim to the important city of Sirmium, the ancient bulwark of the Illyrian provinces. The plains of the Lower Hungary were covered with the Avar horde, and a fleet of large boats were built in the Heresian wood, for the purpose of defending the Danube, and transporting into the Sava, the materials of a bridge. But as the strong garrison of Singidunum, which commanded the confluence of the two rivers, might have flapped its paffage and baffled his designs, he dispelled their appearance by a solemn oath that his views were not hostile to the empire. Sirmium, however, was invested by the perfidious Baian, and its defence was prolonged above three years; but at length of food by famine, a merciful capitulation allowed the escape of the naked and hungry inhabitants. Singidunum, at the distance of fifty miles, experienced a more cruel fate; its buildings were razed, and the vanquished people consigned to servitude and exile. From Belgrade to the walls of Constantinople a line extended of 600 miles, which was marked with flames and blood. The horses of the Avars were alternately bathed in the Euxine and the Adriatic; and the Roman pontiff, alarmed at the approach of a more formidable enemy, was reduced to cherish the Lombards as the protectors of Italy. The despair of a captive, whom his country refused to ransom, did not fail to move the Avars to the invention and practice of military engines, but in the first attempts they were rudely framed and awkwardly managed; and the resistance of Diocletianopolis and Beres, of Philippopolis and Adrianople, soon exhausted the skill and patience of the besiegers. Although the warfare of Baian was that of a Tartar, his mode was susceptible of sentiments that were generous and humane; accordingly, he spared Anchialus, by whose Sabine waters the health of the belov'd of his wives was restored; and the Romans confess, that their starving army was fed and satisfied by the liberality of a foe. His empire extended over Hungary, Poland, and Prussia, from the mouth of the Danube to that of the Oder; and his new subjects were divided and transplanted by the jealous policy of the conqueror. The eastern regions of Germany, which had been left vacant by the emigration of the Vandals, were replenished with Scythian conquests; the fame tribes are discovered in the vicinity of the Adriatic and the Baltic, and with the name of Baian himself, the Illyrian cities of Novi and Littaba are again found in the heart of Russia. In the devastation both of his troops and provinces, the Chagan exposed the vassals, whose lives he degraded, to the first assault, and the favours of the enemy were blazoned before they encountered the native valour of the Avars. The emperor Maurice, after having, for ten years, supported the insalubrity of the Chagan, declared his purpose of marching against the barbarians. Dute to the advice and intercessies of the senate, the patriars, and the council of Constantinople, who diffused him from pernicious encroaching the fatigue and peril of a Scythian campaign, he boldly advanced seven miles from the capital; but Anacrulas was the limit of his progress both by sea and land. In five successive battles, 17,000 barbarians were made prisoners; near 60,000, with four sons of the Chagan, were slain; the Roman general, Praetorius, fortified a peaceful district of the Gepidæ, protected by the Avars; and his left troopers were seated on the banks of the Donmore and the Tytis. Baian, however, again prepared, with dauntless spirit, for recruited forces, to avenge his defeat under the walls of Constantinople. In the reign of Heraclius, A.D. 610—622, Syria, Egypt, and the provinces of Asia, were subdued by the Persian arms under Chosroes; while Europe, from the confines of Italy to the long wall of Thrace, was oppressed by the Avars, infatuated with the blood and rapine of the Italian war. They had coolly massacred their male captives in the field of Pannonia: the women and children were reduced to servitude, and the maidens virgins were abandoned to the promiscuous lust of the barbarians. When Heraclius was preparing to abandon his capital, and to transfer his person and government to the more secure residence of Carthage, the Chagan was encamped in the plains of Thrace; and dismembering his pernicious deluges, solicited an interview, for the purpose of reconciliation with the emperor, near the town of Herece (a place, called by the Hippodrome, the tremendous sound of the Chagan's whip gave the signal of assault; and Heraclius was saved by the defences of his horse. So rapid was the pursuit, that the Avars almost entered the golden gate of Constantinople with the flying crowds; but the plunder of the suburbs rewarded their treachery, and they transported beyond the Danube 270,000 captives. The Persian king having ratified a treaty of alliance and partition with the Chagan, A.D. 626; 30,000 Barbarians, the vanguard of the Avars, forced the long wall of Constantinople, and drove into the city a promiscuous crowd of peasants, citizens, and soldiers. In the mean while the magnifics of the capital repeatedly strove to purchase the ret ent of the Chagan; but their deputies were rejected and insulted; and he suffered the patricians to land before his throne, while the Persian envoys, richly drest, were seated by his side. For ten successive days, the capital was assailed by the Avars, who had made some progress in the science of attack. At length however, by the vigorous resistance of the inhabitants, the Avars were repulsed; a fleet of Scythian canoes was also destroyed in the harbour; the valets of the Chagan threatened to defect; his provisions were exhausted, and after burning his engines, he gave the signal of a short and formidable retreat. To the hostile league of Chosroes with the Avars, the Roman emperor opposed the honourable and useful alliance of the Turks; and the Persians were then reduced to the necessity of retreating with precipitation. Gibbon's Hist. vol. vii. viii.

From the annals of France, cited by Bolandis, we learn, that Thudon, a leader of the Avars, sent embassadors to Charlemagne, in 795, with proposals for surrendering himself and his people to that prince, and for embracing Christianity under such auspices. On:

At this day there exist an Avarian nation in Dagestan, in the district of Debent and Kubet, who, though by their habitation for several centuries with various nations, they have adopted their language and the Mahometan religion, have nevertheless retained some Scythian words, that prove their ancient origin. They march, says Mr. Tooke's Hist. Ruff. ii. p. 93, in the fourth century to Pannonia, dispossessed the slaves, and entailed themselves with those that remained. On the arrival of the Mahares and Romans, they collectively assumed the name Mahures, and by this name they are still distinguished.
tania Prima, was one of the most considerable cities of Gaul at the time of the Roman conquest. About the forty-seventh Olympiad, or 592 years before the Christian era, it was the capital of Gaul, or of that part of it which was subject to the Celts. The Romans erected an amphitheatre in this place, which was not demolished before the year 800; and also a capitol.

AVARILLO, Cape, lies N.E. from Padaran bay, and nearly in the south-east extremity of Cambodia. lat. 11° 35'. E. long. 109° 21'. See COMORIN Bay.

AVAROMO Temo, in Botany, the name of a fihiqua tree, which grows in the Braith. The bark is externally of a cinnarious, and internally of a deep red colour; and is the only part of the plant used by the chiefs for medicinal purposes: though the fame aromatic qualities are by fome applied to the leaves: for the bark, which is of a bitter taste, whether reduced to a powder, or boiled and used by way of fomentation, happily cures invertebrate and obflinate ulcers, and, as it is said, has been found to cure cancers themselves, by means of its remarkably cleaning and drying nature.

Bffe these purposes, it is also made use of on account of its effectually aromatic quality, for baths designed to strengthen and invigorate the muscular parts of the body, when weakened, or too much relaxed. Ray says it is much used by contractors for contracting the puncta.

AVARUM, in Ancient Geography, a promontory of Hifpinia Taragonensis. Polonomy.

AVAS, See ATRAMANIA.

AVAS, in Geography, a mountain of Hungary, in the district of Mararufi.

AVASP, a term frequently used on board a ship, signifying to flip, flip, or flay. The word is formed of the Italian vola, or bali, it is enough, it satisfies.

AVASTOMATES, in Ancient Geography, a people of Africa, in Mauritania. Amm. Marc.

AVATSCHA, or AVATSA, called also ST. PETER and ST. PAUL, in Geography, a sea-port of Kamathamaka, lying in N. lat. 52° 51', and E. long. 158° 48'. The bay of Avatfcha lies in the bight of another formed by cape Gavareea to the south, and Cheeponkofiofobs to the north; the latter bearing from the former N.E. by N. and distant from it thirty-two leagues. From cape Gavareea to the entrance of Avatfcha bay the coast bears to the north, extends about eleven leagues, consists of a chain of rugged cliffs and rocks, and presents in many parts an appearance of bays or latches, which on a nearer approach are found to be low grounds con- necting the head-lands. From the entrance of Avatfcha bay, Cheeponkofiofobs bears E.N.E. at the distance of fourteen leagues. The shore on this side is flat and low, with hills behind that rise gradually to a considerable height. When navigators approach this bay from the southward, this difference of the land on both sides of cape Gavareea in lat. 52° 21', will direct them in their course: when they approach it from the northward, Cheeponkofiofobs becomes very conspicuous, as it is a high projecting head-land, united to the continent by a large extent of level ground lower than the Nofs, and it presents the fame appearance both from the north and south. The situation of Avatfcha may be also known, in clear weather, by the two high mountains to the south of it; of which that nearest to the bay is in form of a fugar-loaf, and the other flat and not so high. These very conspicuous mountains also appear on the north side of the bay, that to the west being the highest; the next, which is a volcano, may be known by its smoke; and the third, which is the most northerly, is a cluster of mountains, with several flat tops. Within the capes, the entrance of Avatfcha bay to the north is pointed out by a light-houfe on a perpendicular head-land, to the eastward of which are many funken rocks, stretching two or three miles into the sea; four miles to the north of the entrance lies a small round island, principally composed of high pointed rocks. The entrance into the bay is at first about three miles wide, and in the narrowest part 11; the length in a north-west direction is four miles. Within the mouth is a noble bafin about twenty-five miles in circumference; in which are the harbours of Rakowee to the east, Taremika to the west, and St. Peter and St. Paul to the north. Such is the account of Avatfcha given in the continuation of Cook's voyages. The bay of Avatfcha, according to the relation of La Peroufe, who visited it in 1787, is certainly the finest, most commodious, and safest that can possibly be met with in any part of the world. Its mouth is narrow, and ships would be compelled to pass under the guns of the fort, which might be erected there. It has excellent holding ground, as the bottom is of mud. Two vaft harbours, one on the eall, and the other on the western coast, would contain all the ships of England and France. The rivers of Avatfcha and Paratouma empty themselves into this bay; but they are impeded by sand banks, and can only be entered at high water. The village of St. Peter and St. Paul is situated on a tongue of land, which, like an artificial bank, forms behind the village a little aboar, enclosed like a circle, which might accommodate three or four dismantled ships during the winter: its entrance is less than 25 toises wide. On the side of this bafin M. Kailoff, the governor, proposed to mark out the plan of a town defined to be the capital of Kamathamaka, and perhaps the grand centre of commerce with China, Japa, the Philippines, and America. A large lake of fresh water lies to the north of the site of this projected city, and at the distance of only 300 toises are many small brooks, the junction of which would facilitate the conveyance of all the commodities necessary for a large establishment. M. Kailoff gave orders for announcing, that an union of several districts with that of St. Peter and St. Paul would soon take place, and that he intended immediately to build a church. The ice in the bay of Avatfcha never extends within 3 or 400 toises from the bank; and during the winter it often happens, that the land winds dipcere that which obtrudes the passage into the rivers of Paratouma and Avatfcha, when the navigation again becomes practicable. This bay is said to bear a great resemblance to that of Drelf, but it affords better anchorage by the mud of its bottom; its mouth is narrower, and of course more easily defended. The two ships in the entrance of this bay, which are leperated by a large channel for the passage of ships, may be easily avoided, by leaving two detached rocks on the ealh shore open with the light-house point, and by keeping, on the contrary, flat in with the west shore, a large rock on the larboard-hand, and which is only separated from the shore by a channel less than a cable's length wide. The tides in this bay are very regular; and the greatest rise of high water, which happens at half past three on the days of new and full moons, is four feet. From M. Daglet's observations, the governor's houfe at St. Peter and St. Paul, is situated in N. lat. 53° 1', and E. long. from Paris, 156° 30'. La Peroufe's Voyage, vol. ii. ch. 22. p. 177, &c. Eng. Tranf.

AVATHA, in Ancient Geography, a town of Arabia Petraea. Polonomy.—Also a town of Phenicia. Notis. Imp.

AVATISCI, a people of Europe, in Gallia Narbonenfe, whose capital according to Pliny was Marutsima; or as Steph. Byz. has it, Myfravela.

AVAUNCHERS, among Hunter, the second branches of a bart's horn.

AVAXA,
AUBAIS, in Geography, a town of
France, in the district of
Moulins. Nat. Imp.

AUBAIS, in Geography, a town of
France, in the department of
Ain, in Rous. Nat. Imp.

AUBADE, a wine of M. et E. Desmaisons,
Aubigné, in the district of
Aix; three leagues south of
Chalon, in the department of
Ain; with a population of
2,835 inhabitants. J. C. B.
AUBERRY, or Aubry, John, was physician to the Due de Montpensier. He was educated under the famous D’Aubigné; and published in 1604, "Les Bains de Bourbon-Lancy;" and in 1608, "De refluenta et vindica Medicae Dignitatis;" both at Paris: but the work which gained him most reputation, and which is still in requisit, is his "Antidote de l’Amour," 12mo, first printed in 1699, and since at Diff. 1693.

AUBERY, Anthony, a French historian, was born in 1617, and after having been educated at Paris for the law, retired into the tranquility of private life, and devoted himself to historical researches. In 1642, his "General History of the Cardinals" was published in 5 vols. 4to.; in 1649, appeared his historical treatise "On the Preeminence of the Kings of France above the Kings of Spain and the Emperors;" in 1674, the "History of the Cardinal de Joyeuse, and Collection of Letters written by that Cardinal to Henry III.;" and in 1666, his "History of Cardinal Richelieu, containing the principal events in the reign of Louis XIII.;" in folio, which was accompanied by two other volumes of titles, letters, dispatches, instructions, and memoirs, serving as documents and vouchers to the general history. When Bertier the printer waited upon the queen regent, requesting her authority for the publication of the work, which contained severe invectives on many persons in high life, it is said that the queen replied, "Finish your work without fear; and put vice to the blush, that virtue alone may dare to show her face in France." Aubery, notwithstanding the freedom with which he wrote, has been charged with drawing, in this work, too flattering a picture of Cardinal Richelieu, and it has been said that this was done from lucrative motives, for gratifying the vanity of the duchess d’Arguinon, the cardinal’s niece. A book, written by Aubery, in 1667, on the just pretensions of the king of France to the empire, and dedicated to Louis XIV., alarmed the princes of the empire, and excited complaints against the author, who was committed to the Bastile, in order to silence and intimidate him, but he was soon released. This work was followed by a treatise "On the dignity of Cardinal," and another of little value, "On the Regale, or the right of enjoying the Revenues of vacant Bishoprics." His last work, published in 4 vols. 12mo. in 1731, was "The History of Cardinal Mazarin;" the facts collected in this publication from the records of parliament, now no longer to be found, constitute its chief excellence: for neither the style nor method of it have much to recommend them, and the author had not sufficient independence of mind or situation to write with impartiality. While he was preparing for the press other historical collections, his life, which had been spent in a course of literary labour and industry, was terminated by an accident in 1695, at the age of 78. Journal des Scavans, t. xxiii. p. 175. Nouv. Dict. Hist.

AUBERRY, Louis de Mauries, a French historian of the 17th century, accompanied his father, who went, whilst he was young, as ambassador to Holland, and visited Germany, Poland, and Italy. On his return to Paris, he obtained the favour of the queen regent; but having no public employment, he retired, after the death of Richelieu, to his family mansion, and spent his time in literary avocations. He died in 1687, and his works were "Memoirs for the History of Holland," published in two vols. 12mo. in 1682; and "Memoirs of Hamburg, Lubeck, Holstein, Denmark, Sweden, and Poland," published after his death, and both printed together at Amsterdam in 1736. The former work contains interesting facts, though it gave offence to the Dutch. Nouv. Dict. Hist.

AUBETTERRE, in Geography, a town of France, in the department of the Charente, and chief place of a canton in the district of Barbezieux, six leagues south-east of Barbezieux, and 73° south of Angouleme. The place contains 776, and the canton 8813 inhabitants; the territory includes 135 kilometres, and 13 communes. N. lat. 45° 15'. E. long. 0° 10'.

AUBETTE, a river of France, which runs into the Seine, near Rouen.

AUBEVILLIERS, a town of France, in the department of the Somme, and chief place of a canton in the district of Montdidier, thirteen miles S. S. E. of Amiens.

AUBEVILLIERS (Leu), a town of France, one league N. N. E. of Paris.

AUBIERES, a town of France, in the department of Puy de Dôme, and chief place of a canton in the district of Clermont-Senard, one league south-east of Clermont.

AUBIERES (Leu), a town of France, in the department of the Two Sevres, and chief place of a canton in the district of Chatillon sur Sevre, 23 leagues E. N. E. of Chatillon.

AUBIGNÉ, Theodor-Agriffa D’, in Biography, was born at St. Maur, near Pons, in Saintongue, in 1550; but, although he was betimes a proficient in literature, the circumstances of his family, on the death of his father, obliged him to recur to the profession of arms. In the service of Henry IV. of France, then king of Navarre, he so far recommended himself to the royal favour, as to obtain several considerable posts, both of honour and profit. Such was his known and approved fidelity, that his royal master ordered his remonstrances on such parts of his private and public conduct as deferred animadversion, without offence. The word of D’Aubigné discontented (said Henry on one occasion) is worth as much as the gratitude of another man;"
and when he was reproached for his friendship for La Tremonville, whom Henry had disgraced and banished, he excused himself by saying, "Sure, he is unfortunate enough to have lost the favour of his master—could I withdraw from him my friendship when he has most need of it?" D'Aubigné, however, found at length that extreme frankness becomes not only unacceptable but offensive to the best of princes. He therefore deserted the court and the kingdom, and retired to Geneva, where he died much honoured and regretted, in 1636, at the age of 56 years. By his wife, Sufiana de Lecat, he had several children, one of whom was the father of the famous Madame de Maintenon. The principal of his works is "An Universal History from 1550 to 1601, with an abridged account of the death of Henry IV." in 3 vols. folio, printed in 1616, 1618, and 1620. The style is exceptionable, being partly vulgar and partly affected and turgid, but the sentiments are free, and the representations of the transactions and characters of the times in general are impartial. On the appearance of the first volume, in which the character of Henry III. is represented in an odious and contemptible light, the parliament of Paris condemned it to the flames. The detail of the military operations is the part of the work that has been most censured for its accuracy. The "Confession of Sancy," and the "Baron de Feneffe," are two tautric poems; the first of which is commended for its vein of ingenious and delicate r又llery, but the second, though not less acrimonious, is of a groser kind. Besides miscellaneous pieces, tragedies, poems, &c., D'Aubigné also wrote "Memoirs of his own life," which were not published till 1731. They abound with curious and free anecdotes, and exhibit a lively picture of the man. Of the rest, we have an English translation. Gen. Dict. Nouv. Dict. Hist.

AUBIGNY, in Geography, a town of France, in the department of Calais, and chief place of a canton in the district of St. Pol, eight miles W. N. W. of St. Pol.—The place contains 640 and the canton 12,152 persons; the territory includes 1774.18 square miles and 39 communes. Also, a town of France, and chief place of a district in the department of the Cher, six leagues north-west of Sancerre, and 74 north of Bourges. The place contains 2533 and the canton 4305 inhabitants. The territory includes 2442.18 square miles and 4 communes. In 1442, Charles VII. granted the estate of Aubigny to John Stuart, count of England and his heirs male, as a recompence for services rendered to him in France, with remainder to the crown on failure of male issue. This peeronary charter took effect in the 16th century, by the death of Charles Stuart without issue. Lewis XIV. made a new grant in favour of Charles II. king of England, the descendant of John Stuart, and made the estate a dukedom, annexing a preeage to it in favour of Charles Lenox, duke of Richmond, natural son of Charles II. by Louise de Quatreville, the dutchess of Portsmouth, from whom it descended to the present duke. The right of peerage to this estate was guaranteed by the treaty of Utrecht, confirmed to the present duke, and regisitered in the parliament of Paris, in 1777. N. lat. 47° 29′. E. long. 2° 29′.

AUBIN, in French Hébert, in the Mange, is derived from the Italian word Uberto, signifying a little horse. Accordingly the light-armed troops were termed in unclassified Latin Héberti, in contradistinction to the cataphracti, or heavy-armed troops. Berenger. See Hobby.

AUBIN, St. B., in Geography, lies on the island of St. B., in the English channel; and at the bottom of it is a town of the same name with a good harbour, defended by a fort near the south-east extremity; three miles west from St. Helier's. N. lat. 49° 7′. W. long. 2° 15′.

AUBIN, St., is also a town of Switzerland, in the principality of Neuchâtel.

AUBLETIA, in Botany (named after M. F. Aublet, author of the History of Plants in Guiana). Schreb. 889. Aepiaba, Aubl. 213. Swartz. Prod. 82. Sloanea. Laxl. 311. Chira. polyandra monogynia. Gen. Char. Col. perianth five-leaved, rigid, spreading, coloured within, pubescent without, deciduous, five-parted; parts linear-lanceolate, acute, with thick margins, which before flowering are contiguous. Cor. petals five, roundish-oblong, smaller than the calyx, with very short claws. Stem. filaments very many, very short; anthers ovate-oblong, outwardly gibbous, gaping on the inner side, foliaceous at the tip, acute, the exterior ones illeris, lanceolate, ending in a foliaceous point, shorter than the corolla. Siph. germ roundish, depresso; style long, fritated, gradually thickening, slightly incurred, stigmas spreading, perforated, ten-toothed. Per. capsule large, orbicular, depresso, ten-toothed, gaping at the base. Seeds. very many, small, roundish, somewhat compressed; receptacle of the seeds, fleshy.

Species, 1. A. Tithourb., aepiaba tibouchon. Aubl. l. c. Swartz. l. c. "Leaves acutely ferrate, hirsute." A tree of a middling size, having a trunk seven or eight feet high, and a root in diameter, with irregular, chopped, soft bark, which is fibrous, and fit for making ropes. Wood white and light; branches spreading in all directions, and bent down; twigs villoso; leaves alternate, oval-oblong, cordate at the base, green above, on short pedicles; stipules in pairs, acute; flowers in racemes, opposite to the leaves. A pair of opposite bractes is placed at the origin of each twig, and four at the peduncle. The raceme, peduncles, and under side of the leaves, are covered with radiate-chopped hairs. A native of Brazil, Guiana, the islands of Cayenne and Tобouc. Aepiaba is the Brazilian name, and Tобouc the Caribbean. 2. A. Petoum., aepiaba potoumo. Aubl. l. c. Swartz. l. c. "Leaves elliptic, acute, ferrate, hoary beneath." This tree often rises forty feet high, with a brown, thick, filamenteo bark, fit for cordage. Wood whitish, soft; branches spreading, arising from the top of the trunk; leaves alternate, nine inches long, and four broad, entire, smooth, ending in a point, petiolate; flowers yellow, in racemes opposite to the leaves, on long peduncles, surrounded by four large scales at the base. A native of Guiana, in the vast forests of Sinemar. It is called petoumo by the Caribbees. 3. A. apera. Aubl. and Swartz. l. c. "Leaves quite entire, pubescent beneath; fruit compressed." A tree from thirty to forty feet high, with bark and wood like those of the preceding. Leaves alternate, ovate, smooth, pointed, rounded, five inches long, and a short footstalk, at the base of which are two stipules, which soon fall off; flowers at the extremities of the branches, in racemes which have at the base two bractes, and at the divisions three or four scales, from which spring three yellow flowers. A native of Guiana and Cayenne. It is also called petoumo by the Caribees. 4. A. levis. Aubl. l. c. 274. (apieiba glabrum) "Leaves quite entire, smooth on both fides; fruit rough, depresso." A tree of middling size, with a trunk from ten to twelve feet high; its wood is very light, leaves ovate, acuminate, on short footstalks; stipules in pairs, short, deciduous; flowers in racemes, greenish. A native of Guiana, flowering in May. The inhabitants call it lavoura, and use pieces of the wood rounded and polished to procure fire hence the Creoles call it bois de macheche.

AUBONDE, in Geography, a town of France, in the department of the Meurthe, and chief place of a canton in the district of Chateau-Salins, five miles N. N. E. of Chateau-Salins.
AUBONNE, the name of a government and of a town in the canton of Berne, in Switzerland, which was formerly a lordship belonging to the marquis du Quesnay, purchased by him of the famous traveller, Tavernier, and afterwards sold to Berne; seven miles W.S.W. of Lausanne. The town is situated near a river of the same name, on an elevation, at the foot of which the river runs with an impetuous torrent. The form of the town is that of an amphitheatre, and in its upper part is a handsome castle, from the top of which may be seen not only the town and its adjacent fields, but the whole lake of Geneva, and the land that surrounds it. In the castle of Aubonne, as well as Thonon in Savoy, which is opposite to it on the other side of the lake, is a tower covered with tin, which makes a glittering appearance when the sun shines upon it. In the ballage of Aubonne are several villages, most of which lie at the foot of Mont Jura; and in one part of this mountain is a deep cave, which forms a natural ice-house; and from the bottom of it ascends the noise of a subterraneous river, supposed to be the river Aubonne, because it first appears, with several fountains, about 100 paces from the foot of this mountain.

AUBREY, in Latin ALBERICUS, John, in Biography, an eminent Elegist antiquary, was born at Enlon Percy in Wiltshire, in 1625 or 1626; and after preparatory education at Malmsbury, entered in 1642 as a gentleman commoner of Trinity college at Oxford. Whilist he was at the university, he collected in compiling materials for the "Monalicon Anglicanum." In 1646, he was admitted a student in the Middle Temple; but the death of his father, and the derangement of his affairs, devolved upon him much business and many perplexing law-suits, which prevented him from prosecuting his legal studies. However, he did not abandon his favourite pursuit, but maintained a regular correspondence with the lovers of antiquities, and furnished Anthony Wood with many valuable materials for his great work. He also preferred an intimacy with several of those philosophical friends, who formed the Royal Society, of which he became a member in 1662. His domestic circumstances were peculiarly distressing; for he married unsuitably, and by the total loss of his property he was reduced to absolute indigence. But he had the wisdom and fortitude to adapt his mind to his circumstances; and accordingly he says of himself, "From 1670, I have, I thank God, enjoyed a happy delitieucy." "This obscurity, which he calls happy, confided in following the best of his genius, while he owed his subsistence to the kindness of his friends; and in labouring to inform the world, in which he knew not how to live." The principal of those who contributed to his support was lady Long of Draycot in Wiltshire, in whose house he had an apartment till his death, which happened about the year 1700, as he was on a journey to Oxford. Aubrey was a good classical scholar, a tolerable naturalist, and a most laborious antiquarian; but he was credulous, and addicted to superstitition. His works were numerous, and most of them were left behind him in MS. These are 1. "The life of Thomas Hobbes of Malmsbury," never published, but having supplied materials for Dr. Blackbourne's account of this philosopher. 2. "Miscellanies upon the following subjects: viz. Day-Daity, Local-faity, Offuta, Omens, Dreams, Apparitions, Voices, &c. &c. Corples-candles in Wales, Magic, &c. Second-lighted perfons, &c." This work, the title of which sufficiently indicates the trifling taste and credulous disposition of the author, was printed in 1696, and Aubrey left corrections and additions for a second edition, which was not printed till the year 1721. 3. "A Perambulation of the county of Surrey, begun 1673, ended 1693;" printed in 1719, in 5 vols. 8vo., and often referred to by topographical writers. 4. "The Natural History of the north division of Wiltshire, never published." 5. "Monumenta Britannica, or a discourse concerning Stowbery, and Roman ruins in Oxfordshire." MS. On the 5 subjects, Aubrey's judgment was held in high estimation by Mr. Toland; and it was his opinion that these remains are druidical, and anterior to the Roman invasion of Britain. 6. "Architectonica Sacra, a dissertation concerning the manner of our church-building in England." MS. 7. "The idea of universal education," and several letters on natural philosophy, and other curious topics, published in "Ray's Letters," by Derham, and other collections. Among his MSS. at Oxford, there is one which is an account of English writers, especially poets, with many of whom the author was well acquainted. This MS. "was lost to Wood, while he was drawing up his "Athenes;" but Wood greatly enriched the MS. while it was in his possession. Wood's account of Milton, the first that ever appeared in print, and which has since furnished the substance of all the materials now extant of Milton's life, was literally taken from this MS." See Warton's Life of Dr. R. Bathurst, p. 151-153. Biog. Brit.

AUBURG, in Geography, a town of Germany, in the circle of Welfphalia, and county of Diepholz, six miles east of Diepholz.

AUBURN, or Aubourn, is a small town in Wiltshire, 7 miles west of London. It is seated on a branch of the river Kennet, and has a small market on Tuesdays. Its inhabitants are principally employed in the manufacture of fustians, a considerable quantity of which is annually sent to the metropolis. The soil of Auburn and its vicinity is chiefly gravel, with a subplanum of chalk. About one mile from the town is a very extensive rabbit warren, whence many hundred couple of rabbits are sent to London during the proper season. Auburn suffered materially in its trade and buildings by a furious fire that occurred here on the twelfth of September 1760, when twenty-two houses, and other property, to the estimated amount of 20,000l., were consumed. By means of a public subscription, the distressed inhabitants obtained some remuneration for their losses; but the town has never recovered the serious injury it then sustained.

AUBUSSON, a town of France, and chief place of a district in the department of the Creuse, fourteen leagues west of Clermont. Its manufacture of tapestry renders the town populous. The place contains 3460 and the canton 9977 inhabitants; the territory includes 153 kilometres and 12 communes. N. lat. 45° 58', E. long. 2° 15'.

AUCA, a town of Asia, in the kingdom of Candahar, forty-five leagues north-east of Zareg.

AUCAGUERELLE, a town of Africa, in the country of Adet. N. lat. 9° 10'. E. long. 44° 45'.

AUCAS, the name of a warlike and independent tribe in South America, occupying the same parts of Paraguay with the Ariponians, and resembling them in their disposition and manners.

AUCH, a city of France, and capital of the department of Gers. Before the revolution it was the capital of Armagnac, and the see of an archbishop, who had the title of primate of Aquitaine; and it was the metropolis of Galcogny. It is seated near the Gers, on the declivity of a hill. Some of the streets are straight, well paved, and full of neat buildings. The cathedral is a large and beautiful building, adorned with painted windows, whose colourings are bright and superior to most of the kind. The number of inhabitants has been estimated at 7696; that of its two cantons at 21,447; the territory of both includes 515 R2 kilometres.
kilometres and 47 communes. The country round Auch consists of high limestone hills, with narrow valleys, in which are many vines, and in the vineyards are also fig-trees. N. lat. 43° 50' E. long. 2° 46'.

AUCH, in Ancient Geography, a river, upon which was situated the town of Gaiths.

AUCHASIS, in Geography, the name of a tribe of mount Ararat, called also Abanas or Ababes, who, according to Strabo, the southern side of the Kaban, and on the eastern coasts of the Euxine. The proper Auchas or Abana is under the Ottoman supremacy, having a prince, who resides at Anchopis. The western races of the Auchasians acknowledge the paramount sovereignty of the Khan of the Crimea; and these are they who at present belong to the Russian Kaban. They mostly live about the river Laba. See ABAE-A.

AUCHTTIE, in Ancient Geography, a people of Asia, in Scythia.

AUCHENIA, in Entomology, the name of a genus of coleopterous insects, adopted after profuse Hthuberg, by Mr. Marshall, in his late and very excellent work intitled Entomologia Britannica. It comprehends a tribe of insects before arranged under the Linnean chrysolomae, and among them several which Linneus had himself assigned to that genus; such as m7edigera, 12-promacata, alparagi, rhamis, lucriva, flavicina, lutea-promacata, and tenella, to which Mr. Marshall adds the subpinaida and rubipes (crincides) of Fabriscius; and a new species which he names flavicollis. The character of the auchenia genus is, antennae filiform; head advanced; thorax cylindrical, and narrower than the wing-cases, and the body oblong. T. 1. p. 213.

AUCHIS, in Ancient Geography, a people of Africa, in the Cyrenean territory.

AUCKLAND, or BISHOP AUCKLAND, in Geography, is a neat market and corporate town situated about ten miles south-west from Durham, and 896 N. by W. from London. This place obtained the latter name at the time of bishop Bee, who is said to have built a magnificent ecclesiastical edifice here during his prélacy, which continued from 1334 to 1350. But this building has been wholly destroyed, and succeeding bishops have erected and enlarged another noble mansion where the present dioecesan occasionally resides. Mr. B. Crampton describes the palace and grounds, as particularly beautiful and grand. "Nothing," he observes, "can equal the approach to the former through the latter, which is varied with verdant slopes, rising hills, woods, and deep precipices impending over the Wear." The ground on which the town and castle are placed is of an angular form, and the streets are extended on the sides of the angle, having the castle at one of the terminating points. The eminence is washed on the north side by the river Wear, and on the south-east by the river Gaunless; the banks are formed into hanging gardens, and the whole aspect is extremely beautiful. The town is built on high ground, which rises nearly one hundred and forty feet from the level of the plain below, and the steepness of the roads that approach the town renders them very disagreeable and difficult for the passage of carriages. A free grammar school was founded here by Anne Swyfte, under letters patent from James I. in the second year of his reign. It has been further endowed in 1753, and is held in an apartment under a small and neat chapel which was then built by a subscription of the inhabitants, and dedicated to St. Ann. As the parish church is at St. Andrew Auckland, a village about one mile distant from the town, this was a necessary improvement. Here are a weekly market on Thursday, and three annual fairs. The market place is a large open space in the middle of the town, and on its western side has lately been crested and established a large manufactury for printing all kinds of cott,

tons, calices, muffles, &c. On the north-west is a sub-
flattened old bridge, built by bishop Skirlaw about 1493, over the river Wear; and in the vicinity of the town are four or five respectable and handsome gentlemen's seats. Leland's Itin. vol. i. and Hutchin's History of the County of Durham, vol. ii.

AUCTA, in Entomology, a species of Cheyromela, with an azure shining thorax; wing-cases blue, dotted, with a red margin. Fabriscius, a native of Europe. In size and appearance it resembles Cheyromela marginata.

AUCTA, a species of Vespa, of a black colour, with the anterior margin yellow; two yellow dots and a transcurrent line on the scutellum; and five yellow bands, the first with a dot on each side, upon the abdomen. This kind inhabits Germany. See A. E. C.

AUCTION, in Commerce, denotes a kind of public sale, much in use for estates, houses, household goods, and other commodities, subject to certain conditions, in which the highest bidder is the buyer. These sales are subject to legal regulations. By 19 G. III. c. 56, an auctioneer is required to take out a licence, forfeiting forth his true name and place of abode; and for the said licence, if it be within the limits of the chief office of excise in London, he shall immediately pay the sum of 20s. and elsewhere 5s. over and besides any other dues or payments for trading in or vending any gold or silver; but, or otherwise; and acting without such a licence incurs, within the bills, a forfeiture of 100l. and elsewhere 50l. The said licence must be renewed annually; and bond must be given at the time of taking it out with two sureties in the sum of 200l. within the bills, and elsewhere in 50l.; that he will deliver in a full account, and make payment of the duties. These duties are as follow: viz. for every 200l. of the purchase money arising by virtue of any sale by auction of any interest in possession or reversion, in any freehold, copyhold, or Leasehold lands, tenements, houses, or hereditaments, and of any annuities, or money charged thereon; and of any utensils in husbandry and farming stock, ships and vessels; and of any reverential interest in the public funds; and of any plate or jewels, shall be paid by the auctioneer or agent 6s. 8d. by 25 G. II. c. 15, and 3l. more by 37 G. III. c. 12. And for every 200l. of the purchase money arising or payable by virtue of any sale by auction, of furniture, fixtures, pictures, books, hereds, and carriages, and all other goods and chattels whatever, 10d. viz. 7d. by 27 G. III. c. 13, and 3d. more by 37 G. III. c. 14. Piece goods are exempted from duty by 25 G. III. c. 63.; and also all goods imported from Turkey, and fudny commodities imported from Africa in British ships, or from any British settlement abroad by 32 G. III. c. 41. There are also further exceptions specified by the statutes 17 G. III. c. 52, 61, 12, 13, and 19 G. 21. c. 56. § 13, 14, 15. The auctioneer is required to give previous notice to the office of excise of the day of sale, and deliver a written or printed catalogue specifying the several articles to be sold, attested and signed by himself or his known clerk, under a penalty of 20l. 19 G. III. c. 56. § 9. He shall also within 28 days, within the limits of the chief excise office in London, and elsewhere within six weeks, deliver in an account in writing of the total amount of the money bid at each sale, and of the several articles or lots there fold, and the price of each; and at the same time make payment of the duties: the truth of the account to be attested upon oath. And by 38 G. III. c. 54. every auctioneer neglecting to make payment within the limited time, shall forfeit double the duty.

Auction, or Avalua, was originally a kind of sale among the ancient Romans, performed by the public eier "/5b husa
AUD

AUCUM, in Geography, a town of France; in the department of the Higher Pyrenees, and chief place of a canton, in the district of Argeles; the place contains 1208 and the canton 10,554 persons; the territory includes 272½ kilometres and 10 communes.

AUDARISTIENSES, in Ancient Geography, a people of Macedonia, in Pelagonia. Pliny.

AUDATTHA, a town of Arabia Deserta. Ptolemy.

AUDIE, in Geography, a river of France, which rises in the Pyrenees, palls by Quilan, Altet, Lamoux, Carcaonne, &c., and discharges itself into the Mediterranean, about ten miles east of Narbonne. It gives name to a department through which it flows. This department is one of the seven formed by Langenedoc, Comminges, &c. It is bounded on the north by the departments of Hérault, Tarn, and Upper Garonne; on the east, by the Mediterranean; on the south, by the departments of the eastern Pyrenees and Arriege; and on the west, by those of Arriege and Upper Garonne. Its superficies is about 1275593 square acres, or 659996 hectares; its population coulds of 219107 persons; and it is divided into four communal districts.

AUDELA, in Ancient Geography, a town of Asia, in Melopotamia.

AUDENA, a river of Italy, in Liguria.

AUDENAERDE, in Geography, a town of France, in the department of the Escaut, and chief place of a district. The place contains 4000, and its two cantons 29924 persons; the whole territory includes 70 kilometres and 21 commune.

AUDENGE, a town in France of the department of the Gironde and chief place of a canton, in the district of Bordeaux. The place contains 800 and the canton 4610 persons; the territory includes 692½ kilometres and 6 communes.

AUDEUX, a town in France of the department of Doubs, and chief place of a canton, in the district of Besançon. The place contains 159 and the canton 11567 persons; the territory includes 227½ kilometres and 44 communes.

AUDIA, a town of Arabia Petraea. Ptolemy.

AUDIANISM, in Ecclesiastical History, the system or sentiments of Audius, and his followers; particularly as to the belief of the human figure of the deity. See Anthropomorphites, and Audius.

AUDIENCE, in a general sense. See Hearing.

The word is formed from audire, to hear.

Audience is also used for the ceremonies practised in courts, at the admission of ambassadors and public ministers to a hearing. In England, audience is given to ambassadors in the presence chamber; to envoys and refidents, in a gallery, closet, or any place where the king happens to be. At their admission, the way in all courts is to make three bows, after which they cover and sit down, the king first covering and sitting down, and giving them the sign to put on their hats. When the king cares not to have them be covered and sit, he continues uncovered himself, and standing all the while, which is taken as a slight and an affront. After the first audience, it does not look well to be too hastily in demanding another. At Constantinople, ministers usually have audience of the prime vizir; in his absence the caimacan admits them to audience.

Audience is also a name of courts of justice or tribunals established by the Spaniards in America, and formed upon the model of the court of chancery in Spain. Of these there are eleven, which dispense justice to as many districts, into which the Spanish dominions in America are divided. They are established at the following places; viz. St. Domingo in the island of Hispaniola, Mexico in New Spain, Lima,
AUD

Lima in Peru, Panama in Terra Firma, Santiago in Guatamala, Guadalquila in New Galicia, Santa Fe in the new kingdom of Granada. La Plata in the country of Los Charcas. St. Francisco de Quito, St. Jago de Chili, and Buenos Ayres. To each of these are subject six several large provinces; and some so far removed from the cities where the courts are fixed, that they can derive little benefit from their jurisdiction. The Spanish writers commonly reckon twelve courts of audience, including that of Manila in the Philippine islands. The number of judges is various, according to the extent and importance of their jurisdiction. Both civil and criminal causes come under their cognizance; and for each peculiar judges are set apart. The Spanish viceroys have often attempted to intrude themselves into the seat of justice; and, therefore, in order to check this interference, which must have annihilated justice and security in the Spanish colonies, the viceroys have been prohibited by repeated laws, from interfering in the judicial proceedings of the courts of audience, or from delivering an opinion, or giving a voice with respect to any point litigated before them. These courts of audience are subject to restraint and limitation. They may advise, they may remonstrate; but in the event of a direct collision between their opinion and the will of the viceroy, what he determines must be executed, and nothing remains for them but to lay the matter before the king and the council of the Indies. But to be entitled to remonstrate and to inform against a person, before whom all others must be silent and tamely submit to his decrees, is a privilege which adds dignity to the courts of audience. Besides, upon the death of a viceroy, without any provision of a successor by the king, the supreme power is vested in the court of audience residing in the capital of the viceroyalty; and the senior judge, affixed by his brethren, exercises all the functions of the viceroy, while the office continues vacant. In matters which come under the cognizance of the audience, in the course of their ordinary jurisdiction as courts of justice, their sentences are final in every litigation concerning property of less value than 6000 pears; but when the subject in dispute exceeds that sum, their decisions are subject to review, and may be carried by appeal before the royal council of the Indies. Robertson's Hist. Amer. vol. iii. p. 286, &c.

AUDIENCE is also the name of one of the ecclesiastical courts in England, which is held wherever the archbishop calls a cause to his own hearing.

The two archbishops have their courts of audience: that of the archbishop of Canterbury is under the direction of the dean of the arches, who is official of the the audience, and keeps his court in the hall of Doctors Commons.

The court of audience is chiefly concerned in differences arising upon elections, confessions, institations, marriages, &c.

AUDICIENDE. See CHAMBER.

AUDIENDO & TERMINALIS, a writ or rather commission, directed to certain persons, when an infusion or great misdemeanor is committed in any place, for the apprehending and punishing thereof.

AUDIENTES, or AUDITORS, in Ecclesiastical History, an order of catechumens; confiding of those who were newly instructed in the mysteries of the Christian religion, and not yet admitted to baptism.

AUDIERNE, in Geography, a town of France in the department of Finisterre, and chief place of a canton in the district of Ponsertx. It is five and a half leagues west of Quimper.

AUDIFRET, John Baptist, in Biography, a French geographer, was a native of Draguignan, in Provence, or of Marseilles, and flourished at the end of the seventeenth, or beginning of the eighteenth centuries. He was appointed by Louis XIV. in 1698, envoy extraordinary to the court of Mantua, Parma, and Modena. He died at Nancy, in 1733, at the age of seventy-six years. His much esteemed work, intitled, "Geographie Ancienne, Moderne, et Historique," was printed in three volumes, 4to, at Paris, in 1699 and 1691, and in 12mo., at Paris in 1694. This work, which unites geography and history, comprehends only Europe, and being left unfinished, it ends Spain, Italy, and part of Turkey in Europe. Nouv. Dict. Hist.

AUDIGUER, Vital Dr., a French noble, was born at Naevre, near Villefranche de Rouergue, about the year 1565, and united literature with the profession of arms. Of his writings the principal are, "A Treatise on the true and ancient Usage of Duels," printed in 8vo, at Paris, in 1617, shewing the injustice of common duels, and recommending a revival of the ancient practice of public combats on great occasions, under royal authority; "Poems," in two volumes, 8vo, printed in Paris, in 1614; and two romances under the titles of "The Loves of Lyfander and Califa," printed at Lyons, in 1622; and "The Loves of Riformado and Ceebonce," at Paris, in 1625. His style is clear and sprightly; and his romances were much read. He is said to have been affiliated about the year 1632. Nouv. Dict. Hist.

AUDINCOURT, in Geography, a town of France, in the departamento of the Upper Rhine, and chief place of a canton, in the district of Pontotrey. The place contains 535 and the canton 6199 persons; the territory includes 1371 kilometres and 24 communes.

AUDIT, a regular hearing and examining of an account by officers appointed for that purpose. See AUIDOR.

AUDITA QUERELA, in Law, is a writ by which a defendant, against whom judgment is recovered, and who, is, in danger of execution, or perhaps actually in execution (or on a statute-merchant, statute-daple, or re-cognition), may be relieved upon good matter of discharge, which has happened since the judgment; as if the plaintiff hath given him a general release; or if the defendant hath paid the debt to the plaintiff, without procuring satisfaction to be entered upon the record. In thef and the like causes, wherein the defendant hath good matter to plead, but hath no opportunity of pleading it (either at the beginning of the suit, or post dorain continuance, which must always be before judgment), an audita querela lies, in the nature of a bill in equity, to be relieved against the oppression of a plaintiff. It is a writ directed to the court, stating, that the complaint of the defendant hath been heard, audita querela defendentis, and then setting out the matter of the complaint, it at length enjoins the court to call the parties before them, and having heard the allegations and proofs, to cause justice to be done between them. Finch, L. 488. F. N. B. 102. It also lies for bail, when judgment is obtained against them by fine facies, to answer the debt of their principal, and it happens afterwards that the original judgment against their principal is reversed; for here the bail, after judgment had against them, have an opportunity to plead this special matter, and therefore they shall have redress by audita querela (1 Roll. Abr. 328.) which is a writ of a most remedial nature, and seems to have been invented, lest in any case there should be an oppressive defect of justice, where a party, who hath a good defence, is too late to make it in the ordinary forms of law. But the indulgence now shown by the courts in granting a summons relief upon motion, in cases of such evident oppression (Lord Raym. 459.), has almost rendered ufele the writ of audita querela, and driven it quite out of practice. Blackft. Com. vol. iii. p. 406.

AUDITONALIS, Scholasticus, in Middle Age Writers,
is used for an advocate who pleads causes for his clients in
audiences. Du Cange.

AUDITOR, a hearer, one who listen or attends to any
thing.

AUDITOR is also used for several officers, appointed to
audit or hear accounts, pleadings, &c.

Anciently the word auditor was also used for a judge, and
even for an inquisitor, appointed by judges to examine and
find out the truth of some matter in contest. Notaries are
also frequently called auditors.

Auditors, in our fathers, is an officer of the king, or some
other person, or corporation, who yearly, by examining the
accounts of under-officers that are accountable, makes up a
general book, with the difference between the receipts and
charges, and the allowances or allocations.

Receivers-general of far-farm rents, &c. are also termed
auditors, and hold their audit for adjusting the accounts of
the said rents, at certain times and places appointed. There
are also auditors assigned by the court to audit and settle
the accounts, in actions of account, and other cases, who are
proper judges of the cause, and pleas are made before them, &c. 1 Brow. 24. See Account, and
Assumpsit.

Auditors of the Revenue, or of the Exchequer, are offi-
cers who take the accounts of those who collect the revenue,
taxes, &c. raised by parliament; as also of the sheriffs, ele-
choners, collectors, tenants, and customers; and all them
down, and perfect them.

Auditors of the Profits, or Imprest, are officers in the ex-
chequer, who formerly had the charge of auditing the great
accounts of the king's customs, naval and military ex-
pen ses, and of all monies impressed to any man for the
king's service; but they are now superseded by the com-
missioners for auditing the public accounts. See Public Accoun-
ts.

Auditor of the Receipts is an officer of the exchequer
who files the tellers' bills, and makes an entry of them, and
gives the lord-treasurer a certificate of the money received
the week before. He makes deputees to every teller, be-
fore they receive any money, and takes their accounts.
He also keeps the black book of receipts, and the trea-
urer's key to the treasury (where the ancient leagues of the realm,
and many records of the king's bench, and common pleas,
are reported); and sees every teller's money locked up in
the new treasury. 4 Stat. 107. All the exchequer bills,
orders, deputees, patents, and other instruments which
pafs the office of the exchequer, are signed by him.

There are also auditors of the first fruits; of the princi-
palities of Wales; of the duchy of Cornwall, &c. See First Fruits, &c.

Auditor of the Rotuli, the apostolic chamber, the chate-
el, &c. See Rotuli, Chamber, &c.

Auditors in Church History. See Audients.

The auditors formed one branch of the Manichean sect,
which was divided into eccadudiors; corresponding,
according to some writers, to clergy and laity; and, accord-
ing to others, to the faithful and catechumens among the
catholics. By the Manichean rule, a different course of life
was prescribed to the elect from that of the auditors. The
latter might eat flesh, drink wine, bathe, marry, trade,
possess estates, keep magistracy, and the like; all which
things were forbidden to the elect. The auditors were
obliged to maintain the elect, and kneaded down to ask their
blessings. Beaufrere observes, that the elect were ecclesiastics,
and in general such as made profession of observing certain
counsels, called evangelical; such as the clergy and monks;
and they were called the perfed by Theodoret. The auditors
were the laity, and so denominated, because they heard in
the church, while others taught and instructed. Lardner's
Works, vol. iii. p. 404, &c.

Auditors, Conventual, Collegiate, &c. were officers for-
merly appointed among the religious, to examine and pass
the accounts of the house.

Auidorius Matutus, or Auditorius Paffage, in
Anatomy. There are two passages, differing slightly by this title:
an external one, by wliich the air has access to the tympanum;
and an internal one, by which the seventh pair of nerves pafs
from the brain into the petrous part of the temporal bone.
See the Description of the Ear.

AUDITORY, in an adjective sense, something belong-
ing to the sense of Hearing.

AUDITORY, Audience, is also a collective name, de-
oting an assembly of persons, hearing or attending to a
person who speaks in public.

AUDITORY is also used for the seat or bench where a
magistrate or judge hears causes.

At Rome, the several magistrates had auditories, or
seats of justice, according to their dignity. Those of the
superior officers were called tribunals; those of the inferior,
justices.

The pedanei had their benches or auditoriums in the per-
tice of the imperial palace. Those of the Hebrews, at the
gates of cities. The judges appointed by the ancient
kings distributed justice under an elm, which was usually
planted before the manor-house, and served them for an
auditory.

AUDITORY, Auditorium, in the Ancient Churches, was
that part of the church where the audientes stood to hear,
and be instructed; and it was that part now called navis ecclesiae.
See Nave. In the primitive times, the church was so fre
it.

The people had their benches or auditoriums in the por-
tico of the imperial palace. Those of the Hebrews, at the
gates of cities. The judges appointed by the ancient
kings distributed justice under an elm, which was usually
planted before the manor-house, and served them for an
auditory.

AUDITORS, in Ancient Geography, a promontory of Africa,
in Mauritania Cufariens. Ptolemy.

AUDRAN, in Biography, the name of a celebrated fa-
mily of artists, who acquired eminence in painting and en-
grav ing,
The first of the family was the son of Louis, who lived in the reign of Henry IV. of France. He was born at Paris in 1572; but as he made no great progress in the art of engraving, his prints are held in little or no estimation. He resided at Lyons, and died there in 1677.

Carl, or Karl, was the brother, or, as some say, the cousin-german of Claude, and born at Paris in 1582. For the purpose of gratifying and improving an early taste for the arts, he went to Rome, and at his return adopted that species of engraving, which is performed merely with the graver. His style was that of Corinachus Cloenamur, but meeter. The abbe Marolles, who speaks of this artist in terms of high commendation, attributes 150 prints to him, amongst which are "The Annunciation," a middle-sized plate, upright, from Ambide Caesar; and "The Assumption," in a circle from Dominichino, are the most esteemed. His full prints were marked with the letter C; and he afterwards, by way of distinguishing his prints from those of his brother Claude, used the letter K. He died at Paris, in 1674.

Germain was the eldest son of Claude, first mentioned, and born at Lyons in 1611. At Paris he perfected himself under his uncle Carl, and on his return to Lyons, published several prints which did honour to his graver. Such was the estimation in which he was held, that he was a member and professor of the Academy established in this town. He died at Lyons in 1710, and left four sons, all artists.

Claude was the second son of Claude, and born at Lyons in 1639; having studied painting at Rome, he was, on his return, employed by Le Brun, to affix him in the battles of Alexander, which he was then painting for the king of France. He was admitted into the Royal Academy in 1675, and died at Paris in 1684, applauded not less for his virtues than his talents.

Girard, the most celebrated artist of the whole family of Audran, was the third son of Claude, and born at Lyons in 1640. Having learned from his father the first principles of design and engraving, he removed to Paris, where his reputation introduced him to the acquaintance of Le Brun, by whom he was employed in engraving the battle of Conflans, and the triumph of that emperor. At Rome, he studied under Carlo Maratti, and engraved several fine plates, and particularly the portrait of pope Clement IX. Recalled to Paris by Louis XIV. at the instigation of M. Colbert, after a residence of three years at Rome, he assiduously applied to engraving, and was appointed engraver to the king, who greatly encouraged him. In 1681, he was named counsellor of the Royal Academy, and died at Paris in 1715. Strutt considers him as one of the greatest engravers, without any exception, that ever existed in the historical line; and a careful examination, he says, of the battles of Alexander, engraved by this artist, will of itself justify this assertion. His distinguishing excellence consists in his contracting no manner of his own, but transcribing on copper simply, with great truth and spirit, the style of the master whose pictures he copied. "On viewing his prints, you lose sight of the engraver, and naturally say, it is Le Brun, it is Poussin, it is Mignard, or it is Le Seur, &c. as you turn to the prints which he engraved from those masters." His works, exclusively of his portraits, are distributed into four classes: viz. 1. his flight prints or etchings, to which little or nothing was done with the graver, among which are the "Deluge," the "Passage through the red sea," the "Combat of Joshua against the Amalekites," the "Empire of Ptolemy," the "preferatio of Pyrrhus," a "cycling" from Le Brun representing the law of the land; and "The more finished, but in a rough, bold manner; e.g. "Paul and Barnabas at Lystra?;" "Coriolanus appealed by his family;" "Time supporting Truth;" the ceiling of the chapel de Saulrs, representing the "Accomplishment of the old law by the new one," engraved in 1681, from Le Brun, wonderfully uniting great spirit, character, expression, and beautiful drawing; and the "Death of St. Francis." 3. Those in his most finished manner; as the "Battles of Alexander," from Le Brun; viz. "The passage of the Granicus;" "the battle of Arbela;" "Porus brought to Alexander" after his defeat; "Alexander entering the tent of Darius;" and "the triumphant entry of Alexander into Babylon;" the "Pell," from Peter Mignard; the "baptism of the Pharisees," from N. Poufua; the "martyrdom of St. Lawrence," from Le Sueur; the "martyrdom of St. Agnes," from Dominichino.

Such as he did with the graver only, which are few, and of inferior merit; such as "Æneas saving his father Anchises," after Dominichino; and a small folio "Frontispiece" to the eglogies of the popes and cardinals, from Cyro Peri.

Bresis, second son of Germain Audran, was born at Lyons in 1661, and after receiving instructions from his father, removed to Paris, to enjoy the tuition of his uncle Girard, where he acquired great reputation. He died at Louzaron in 1721. His manner was founded upon the bold clear style of his uncle. His outlines were firm, and determined; his drawing correct; the heads of his figures are in general very expressive; and the other extremities well marked. But his works, compared with those of his uncle, want the mollceurs and harmony, which are so conspicuous in the latter. Among his neatest prints may be reckoned that which represents "Alexander fickle," from Le Sueur.

Johns, the third son of Germain, was born at Lyons in 1665, and perfected himself in the art of engraving, at Paris, under his uncle Girard. His reputation began to display itself at the age of twenty years; and such was his future success, that in 1707, he obtained the title of engraver to the king, and had a pension from his majesty, with apartments in the Gobelins; and in 1708, he was made a member of the royal academy. He was eighty years of age before he quitted the graver, and near ninety when he died. In his most malleably and bell prints, the etching constitutes a great part; and he has finished them in a bold, rough style. The drawing of the human figure is correct; the heads are expressive, and finely finished; the other extremities are well marked; but he is inferior to his uncle. He wants that harmony in the effect; his lights are too much and too equally covered; and there is not sufficient difference in the style, in which he has engraved his back grounds, and his draperies. The following prints, besides many others, are unfailingly esteemed; viz. "Moses saved by Pharaoh's daughters;" "Athabah reading her clothes, on discovering the king is the temple;" "Either before Anasracus;" "Cupid and Psyche;" all from Ant. Corpel. "The presentation of Christ in the temple," from Corene. "The miraculous draught of fishes," and its companion "The resurrection of Lazarus," from Jouvenet. "The battles of Alexander," small, from the large prints; "Moses defending the daughters of Jethro," and its companion, "Moses expelling the daughter of Jethro;" "the miracle of the five loaves;" "Christ healing the sick and lame;" and "Christ carrying the cros," both from Ant. Dier, &c.

Louis, the last son of Germain, was born at Lyons in 1670, and studied at Paris in the school of his uncle Girard. He died suddenly at Paris in 1712. Among his most esteemed prints are, "The seven acts of mercy," from Seb. Board, and "The Cadaver or Corps," from R. A. Houalle, Sculp. Del.
well of St. Omer. The place contains 2058 and the canton 11,709 inhabitants; the territory includes 22½ kilometres and 14 communes.

AUDEUX, in Arie, is a town of France, in the department of the Hérault, and capital place of a canton in the district of Bessèges, 43 kilometres west of Thononville. The place contains 205, and the canton 11,729 inhabitants; the territory includes 284½ kilometres and 23 communes.

AUERS, in Aribere, Geographies, a river of Africa, placed by Ptolemy near the bottom of the Sinae Numero; but no traces of it now remain.—Also, a mountainous district in the interior part of Mauritania Sitifensis, the Moors Arabians of the middle age, and Jibbel-Aures, as the Turks pronounce it. It is a chain of eminences running one into another, with several beautiful little plains and valleys intervening. The higher and the lower parts of it are very fertile, and are regarded as the garden of this province. The whole mountainous tract is reckoned to be about 120 miles in circuit, and the northern part, which is visited every year by a flying camp of the Algerines, is polved by such a number of clans, etc. the Boozenah, Lathah, Maffih, and Bouref, that it requires 40 of their tribus to bring them all under contribution. Shaw's Trav. p. 57.

This mountain, according to Bruce (Travels, &c. Introd. p. 28.), is inhabited by a savage tribe, of fair complexion, red hair, and blue eyes; called Nearied, and supposed to be a remnant of Vandals, who have maintained themselves in the wildnesses, in defiance of the Moors and Arabs. Each of the people of this tribe live in the middle of the face between their eyes, a Greek cross, perfect into antiquity, and this mark seems to be the chief vesture of Christianity among them, which religion they not only acknowledge, but boast that their ancestors professed it. Procopius (Bell. Vandal. lib. i. c. 15.) mentions the defeat of an army of the Vandal nation near this place, of which these are probably remains. They pay no taxes to the Bey, but live in constant defiance of him. In this mountain is the Lambes of Ptolemy.—Also, the name of a small part in the eastern part of Mauritania Cearienitis, mentioned by Ptolemy, and placed by him in the promontory of Jartifh, north-east of the mouth of the river Nafah.

AVE, in Geographies, a river of Germany, which runs into the Weser, three miles south of Nienburg, in the circle of Welfphalia.—Also, a river of Germany, in Lower Saxony, which runs into the Fulde, two miles S.S.E. of Zeller. Also, a town of Germany, in Upper Saxony, and circle of Ersching, five miles north-west of Schwerzenberg.

AVEY, a river of Portugal, which runs into the sea near Villa de Conde, in the province of Entre-Douro e Minho.

AVEBURY, or ABURY, a name given to a village in England, situated in the county of Wilts, about five miles west of the town of Marlborough, nineteen miles north of Stonehenge, and eighty miles west of London. As a village it presents no particular claims to public notice, but as the site of the most remarkable and tremendous monument of Britain's Antiquity in the island, it becomes exceedingly interesting to the antiquary and historian.

The British bards and druids have been repeatedly noticed and often described by our ancient historians; some of whom have given very copious accounts of their religious and juridical rites and ceremonies; but none of them have left complete and satisfactory information relating to the men, their manners, or monuments. Hence arises the great difficulty of giving decisive descriptions of those subjects; and the repeated wars and invasions that have harassed this country, have nearly destroyed all documents and monuments of British antiquity. Among the vallies of former times, we recognize the Rupeous temple at Avebury, which was unquestionably the most considerable and important in Great Britain. It consisted of a number of large unhewn stones placed perpendicularly in the ground, and disposed in parallel rows and circles. There were four of the latter included within a fifth of larger circumference, and at the end of the southern avenue, about one mile distant from the great circle, were two concentric oval arrangements of stones. The number of stones originally employed in the whole work united to fix hundred and fifty, and most of them measured from twenty to forty feet in height above the ground, forty feet in circumference, and weighed from forty to fifty-four tons each. The large circle, and the principal part of this temple, were surrounded with a very considerable vallum and ditch, which included an area of twenty-two acres of ground, and measured about 1400 feet in a transverse diameter. This bank and ditch must have been produced with immense labour, and its peculiarity of formation proves that it was never intended for a fortified place in time of war, as the bank is thrown up on the outer verge of the ditch; whereas all military encampments have the bank within the ditch, to give an advantageous height of ground to the besieged inhabitants. The vallum measures about 30 feet in height from the top to the middle of the ditch. Supposing that it was raised for spectators to behold any ceremonies performed in the included area, it would accommodate above 70,000 persons, and allow two square feet to each. This boundary embraced one large, and four small circular arrangements of stones. The vallum was about thirty-five feet within the ditch, and contained 100 stones, placed at nearly equal distances from each other. Within this circle were two double concentric circles composed of eighty-eight stones, three others called the cove, and one called the central obelisk. From the large circle proceeded two avenues, or double rows of large upright stones, placed at nearly regular distances in each row, and from one row to the other. These confounded 200 stones, extended about one mile in length each way, and were called the Beckhampton and Kennet avenues. The first proceeded from the temple in a westerly direction, and was terminated with a single stone; whilst the other took a south-easterly course, and had two oval rows of stones at the extremity. The objects we have already described, are considered by some persons as the whole of this extraordinary monument; but it seems very probable that Sibury Hill, some crumleths, other circles, and numerous relics, were originally connected with it. Sibury Hill is considered as the largest tumulus, or barrow, in England, and its situation implies that it was intended to mark the meridian line from the centre of the temple. Dr. Stukeley states, that it is directly south of the great circle. It measures 105 feet diameter at top, 500 feet at the base, 240 feet in height, following the surface of its northern side, and 1682 feet in circumference at the bottom. From the top of this artificial hill a spectator commands a view of the western avenue, and the whole area of the temple, with a considerable tract of flat country to the north and west. This barrow has been dug into by some persons, who expected to make interesting discoveries; but for want of perseverance, or well-directed research, they discontinued their operations, without gratifying their curiosity, or rewarding their labour.

The Goths, Vandals, and Turks, have often been stigmatized as the merciless destroyers of every venerable and interesting monument of antiquity; but rarely, they were not more reverent in their behaviour than many of the inhabitants of this highly civilized and refined country: some of whom have revered such ingenuity and labour unsentily and deliberately destroying this singular monument of ancient customs. We have already stated that...
AVE

it originally consisted of 650 stones, but most of these have been broken in pieces, by means of fire and manual labour, and the differerent fragments ascribed to the destruction of walls, hovels, and common roads. In 1722, only forty remained of the great circle, of which number seventeen were flaking; but these are now reduced to nine. The interior circles were almost entire in 1716, but in 1723 only two stones were left erect belonging to the outward circle of the northern temple. Of the Kenot area, there were seventy-two stones in 1722, of which only eight or ten remain; and only two of the Beckhampton area.

The stones used in forming this temple are called by the inhabitants, Bolderstones and Sarfons. They are of fibrous grit, being of the same species as those that accompany the great stratum of chalk, which crosses England from E. N. E. to W. S. W. These stones lie on the surface of the ground in detached masses, unconnected with any stratum of chalk.

Having here what the temple was, and what it is, we will next endeavour to explain its appropriation and use; in doing which, we found our deductions principally on the trials and traditions of the Welsh bards, a class of people more likely to preserve correct memorials of the ancient Britons, which will be found in any of the Roman histories. By these writers we learn that Avebury was the great national temple, or circle of convention of the ancient Britons; in which they assembled from all parts of the island, on the four grand festivals, which were held at the time of the two solstices and the two equinoxes, more particularly on midsummer day, and new-year's day, or the winter solstice. The Bardic trials called the temple at Avebury, one of the three primary Gewifdæa, or supreme seats of the island of Britain, the other two were those of Beigewater and Moel Efor.

The circles at Avebury and Silbury Hill had their names reciprocally from each other, for the former was termed Garifen-Bryn-Georfan, or the supreme feast of the Hill of preference, or cognition; and the other was called Cleder-Cytrægen, or the tumult of the circle of conventions. In this place the legislative, faucetoral, and scientific classes, which formed the ancient British constitution, held their great assemblage called the Beirô, Drujynæ, and Gwern, or Bards, Druids, and Ovate; and, according to Caesar, that the Druids of Gaul, "who wished to be perfectly skilled in the Druidical science," occasionally visited England to learn it. From the magnitude and situation of Avebury, we are induced to believe that it was their place of meeting or convention. The situation was the most convenient of any in Great Britain; and that it was the grand metropolitan itation, seems satisfactorily ascertained by its magnitude above all others in the island; by the variety of British roads or rideways which converged to this spot; by the vast number of barrows scattered all over these plains, and by several other relics of remote antiquity to be found in the neighbourhood. To Dr. Stukeley we are indebted for much information concerning this place, but for his diligent inquiries and researches in 1722, &c. we should never have been able to ascertain the figure and dimensions of the temple; with his assistance, aided by repeated examination of the spot, we are enabled to present our readers with the account which we hope will prove as satisfactory as it is faithful. To those who wish to fix the position of the various parts, we must refer to Britton's Beauties of Wiltshire, vol. iii.; and for accounts of some subjects collaterally connected with this, see Bard, Barrow, Cromley, Druid, Kistvæn, Stonehenge, &c.

AVEHEN, a town of North America, in the county of Mexico, and district of Chiametan.

AVEIA, in Ancient Geography, a town of Italy, in Samnium, south of Ambricum.

AVEIN, in Geography, a village of the Netherlands, in the duchy of Luxembourg, near which the army of France defeated the Spaniards; two leagues from Rochefort.

AVEIRO, or Braganza Nova, a sea-port town of Portugal, in the province of Beira, situated in a flat and marshy country, at the mouth of the Vouga, and containing about 1,420 houses, divided into four parishes, and six monasteries. The river Vouga flows through the town, where it is very narrow; but it is adorned with a handfome quay. Near the town it divides into two branches, one to the left and running southward to the sea, the other flowing northward to Ovar. Its trade is considerable, as small boats only come to the town: and as the bar is continually shifting, none but small ships can pass it. The fishery of this place is alone worthy of notice; for Aveiro chiefly supplies the province of Beira with Sardins, which are carried by large troops of mules into the higher parts of the province. Salt is also produced here in large quantities; though it is not reckoned so good as that at St. Ives and Lisbon. The town is, on account of its marshy situation, uninhabited, which exposes the inhabitants to frequent attacks of agues and pestilential disorders. Aveiro is nine leagues from Coimbra, and eleven fourth of Oporto. N. lat. 40 30', W. long. 9° 8'.

Aveiro, a river of France, which runs into the Tarn, four leagues below Montauban.

AVELGHEN, a town of France, in the department of Leys, and chief place of a canton, in the district of Couray. The place contains 3355 and the canton 13,716 inhabitants: the territory includes 57 3/12 kilometres and 9 communes.

AVELINE, in Conchology, a name given by French naturalists to one kind of land-faun found in Ambyona, and called by Linnaeus belis ferrarius.

AVELLA, in Geography, a town of Italy, in the kingdom of Naples, and county of Lavora, four miles north-east of Nola. The situation of this town, with its castle, is delightful, and it commands a view as far as Naples. Not far from this place are the ruins of Abelba. It now gives the title of prince to the family of Disa.

Avelian, a species of PHELMA aenus.

AVELLANA, in Conchology, a species of Helix, with a slightly unibulated shell, of an oblate and somewhat triangular form, rough, plated, and fissilv within; aperture smooth and erect; and an elevated circle on the first whorls of the spire.

Aveliana, a species of Patella with a thia white shell, very easily irritated; and an oblong perforation divided by a ligation. Native place unknown. Menchen, Naturf.

Aveliana, in Entomology, a species of Phalena (Trrix) found on the nut-tree in the north of Europe. The wings stellateous, with three short bands. Linn. Gmel. &c.

Aveliana, a species of Attela, of a black colour, with the wing-cases, thorax, and legs red. This insect Gmelin's conjectures, may be only a variety of attela coryli; it inhabits Germany, and is called by Scolopi curculo colliari.

Aveliana, a species of Cithara, of a black colour, with brown upper-wings that are white at the base and tip; legs fuscous. Found on the nut-tree. Gmel. Scop. &c.

Aveliana, a species of Phalaena (Bombyx); that is found on the nut-trees in Europe. The wings are dull ash-coloured, with an obscure fuscous band, and without spots. Fabr. Gmel. &c.

Aveliana, in H. radleyi, a term peculiar to the form of acorns, whose quarters resemble those of scatelana, or siled-grad. nut.

Avellin, in Geography, a town of Italy, in the kingdom
A.V.E.

kingdom of Naples, and Principepia Ultra, the see of a bishop, and fulfiller of the archbishop of Benevento. Avellino, which was probably founded by the Lombards, is a considerable city, extending a mile in length down the valley of a hill, with ugly freets, but tolerable houses. The churches are crowded with monstrous ornaments in a barbarous stile, which the Neapolitans seem to have borrowed from the Spaniards. The cathedral is a poor building, adorned merely with uncouth Latin dillicha, and chapels Gothic sculpture. The inhabitants have access to a statue of St. Laurence, with a phial of his blood, which for eight days in the month of August entertains them with a miraculous liquefaction similar to that of St. Januarius at Naples. The only edifice of note is a public granary, of the compos- ite order, adorned with antique statues, and an elegant bronze one of Charles II. king of Spain, while a boy, call by Cavalier Cofimo. The number of inhabitants amounts to 8 or 10,000. The bishop's revenue is about 6000 ducats or 1251. a year. The magistracy consists of a fyndic and four ekti, who are chosen annually; but these offices are engrossed by a certain number of families of some distinction, who neither intermarry nor associate with the other burghers. The estates of the prince amount to the yearly value of 20,000 ducats or 4150., and 2000 arre from duties on the dye of cloth, which is made of various qualities and colours, but chiefly blue. The fuel sells for thirty carlin a kanna, and pays twenty-six grana duty of entrance into Naples. Many wealthy merchants are concerned in this cloth manufacture, some of whom employ in it a capital of 80,000 ducats, or 15,000., The poor women who spin the wool, must work very diligently to earn about four grana, a day. The second article of trade is macaroni and paits of many kinds, which are of excellent quality, and much esteemed through the country. Wooden chairs are also made and sold here in great quantities. Avellino abounds with all sorts of provisions; each street is supplied with fresh water; but the wine is indifferent. The soil of this district, consisting chiefly of volcanic subulances, produces little corn, but abundance of fruit, of which the apple is held in high estimation. The most profitable of all fruits, however, is the apricot. Nut-bulbes cover the face of the valley, and in good years yield a profit of 60,000 ducats, or 11,250., The nuts are mostly of the large round species of silberd, which we call Spanish; and the bulbes were originally imported into Italy from Pontus, and known among the Romans by the appellation of "Nux Pontica," which, in progress of time, was changed into that of "Nux Avellana," from the place where they had been most successfully propagated. The proprietors plant them in rows, and, by dreffing, form them into large bulbes of many items. Every year they refresh the roots with new earth, and prune off the fraggling roots with great attention. Swinhorne's Travels, vol. i. p. 171, &c.

A.V.E.M.A.R.I.A, or Ave-Mary, the angel Gabriel's falutation of the Virgin Mary, at his bringing her the tidings of the incarnation; thus called, as beginning with these words, Ave Maria, q. d. Holl Mary.

The ave-mary is a prayer or formule of devotion very usual in the Romish church. It was added to their prayers by order of pope John XXII. in the fourteenth century.—Their chaplets and rosaries are divided into fo many avenary, and to many pater-naglers; and hence the beads themselves which indicate them, are also called aver, or ave-marys.

AVENA, in Botany, oat-grafs (supposed from avo, to desire, or covet; cattel being fond of it). Lin. g. 91. Schreb. 122. Jull. 32. C.fas, triandria digynia. Nat. Ord. graminia. Gen. Char. Cal. glume generally many-flowered, two-valved, loosely collecting the flowers; valves lance-olate, acute, ventricose, loof, large, awnless. Cor. two-valved; lower valve harder than the calyx, the fuzz of the calyx, roundish, ventricose, acuminate at both ends, curling from the back an awn spirally twisted, reflex; median two-leaved; bellows lanceolate, gibbous at the base. Stems filaments three, capillary; anthers oblong, forked. Pfit. gem obtuse; styles two, reflex, hairy; stigma simple. Per. none. Cor. small firmly closed, grows to the seed and do- not gape. Seed, one, slender, oblong, acuminate at both ends, marked with a longitudinal furrow.

Species. 1. A. fihirica, Siberian oat-grafs; selleu gluma, villosa, arilis calyce triplo longioribus. Gmel. Sib. i. 173. t. 22. "Panicled; calyxes one-flowered; seeds hirfute; awns thrice the length of the calyx." Cunis very slender, from two to three feet high; leaves rolled up at the edges, from fix to twelve inches long; panicle reflammimg a spike, often directed to one side; glumes of the calyx equal, dagger-pointed, membraneous towards the point; glumes of the corolla of the fame length, extremely villous. A native of Siberia, introdiced in 1777 by Mell. Kew. and Lee. 2. A. ulmei, tall oat-grafs. Huds. With. Curt. Lond. 3. 6. (grace) caruinum adnudum; Ger. "Panicled; calyxes two-flowered; hermaphrodite; inflorescence almost awl-like, male awned." Root perennial; flums erect, round, fmal, flxh, with four or five purplish joints, above three feet high; leaves frizzed from five inches to a foot in length; panicle erect, flning, nume- roously branched; spikelets two-flowered, one male and the other hermaphrodite; valves of the calyx unequal, the largest marked with three, the smallst with one green nerve. In the hermaphrodite flower, the midrib of the outer valve forms a short awn, and the bottom very hairy; nectary two small lanceolate glumes, somewhat globular at bottom; germ villose. It is common on banks, in hedges, on the borders of fields, and sometimes in wet meadows. It flowers in June and July. It is an early grafs, very produc- tive, and yields a plentiful aftermath. In particular situations the base of the stem becomes knobby and forms the variety abulunci, which, in some areas, is very troublesome, and is one of the several grafses confounded under the name of quick or cooch. 3. A. fittiformis. "Panicled; calyxes two-flowered; awns twice the length of the feed; culm branching." Culin a foot high, often recliining, smooth, with brown joints; branches from each axil, short; one glume of the calyx lanceolate, the other ovate; flretos two, fefile; corolla smooth, except the outer glume, which is rough with hairs. A native of the Cape. 4. A. pennyl- vanica. Pennylvaniaen oat-grafs. "Panicle attenuated; calyxes two-flowered; seeds villose; awns twice the length of the calyx." Observed in Pennsylvania by Kalm. In- troduced here in 1785, by Dr. Pitzamn. 5. A. laefiuliana. Spanish oat-grafs. Cavan. Hilp. t. 45. f. 1. "Panicle contracted; flretos in pairs, hirfute; one-peduncled, with two awas at the top, the middle awn largelf. Root annual, capillary; culms very slender, from two to four inches high; leaves short, flabrit; one of the flretos is fefile, the other on a villofe pedicel; valve of the corolla brilh-faced at the tip, with a twisted awn on the back twice the length of the valve. It grows near Madrid, and at the Cape of Good Hope. Introduced here by Monf. Richard, in 1770. 6. A. ffitura, cultivated oat. Of this there are four varieties, the white, black, brown or red, and the blue oath. "Panicled; calyxes two-fed; feeds very smooth, one-awned." Annual; culm or straw upwards of two feet high; panicle various in different varieties, but always loose and pen- dulous; the two glumes or chaffs of the calyx are marked
with lines, pointed at the end, longer than the flower, and unequal. There are usually two flowers and seeds in each calyx; they are alternate, conical, the smaller one is awned, the larger one puts forth a strong, two-coloured, bent awn, from the middle of the back. No botanist has been able to ascertain satisfactorily the native place of growth of this, or indeed of any other fort of grain now commonly cultivated in Europe. The varieties mentioned above have been long known, and others have been introduced, as the Poland, the Friedland or Dutch, and the Siberian or Tartarian oat. The blue oat is probably what is called Scotch grey. The white oat is most common about London, and those countries where the inhabitants live much upon oat-cakes, as it makes the whitest meal. The black is more cultivated in the northern parts of England, and is esteemed a hearty food for horses. The red oat is much cultivated in Derbyshire, Staffordshire, and Cheshire; it is a very hardy oat, and gives a good barley. The straw is of a brown red colour, very heavy, and a very good food for horses than either of the former oats. In Lincolnshire they cultivate the forrished Scotch grey. The Poland oat has a short plumplike grain, but the thicknees of the skin feems to have brought it into disrepute among the farmers. Add to this the straw is very short. It was fown by Mr. Lille, in 1799. Friedland, or Dutch oat affords more straw, and is thinner flaked, and the grains mostly double. A white oat, called the *petasus oat* in Cumberland, where it was lately discovered, promises, from the size of the grain and the length of the straw, to be the most valuable of all; it is now very generally bought for sowing. The oat is a very profitable grain, and a great in improvement to many estates in the north of England, Scotland, and Wales; for it will thrive in cold barren soils, which will produce no other oat of grain; it will also thrive on the hottest land; in short there is no soil too rich, or too poor, too hot, or too cold for it; and in wet harvests, when other grain is spoiled, this will receive little or no damage. The meal of this grain makes a tolerably good bread, and is the common food of the country people in the north. It is also esteemed for pottage and other mixtures, and in some places they make beer with it. *A. nuda*, naked oat, pilcorn, or pillis. *Panicled* calyxes three-flowered; receptacle exceeding the calyx; petals awned at the back; the third floret awnless.

This has been considered as a British plant by Ray, Hudson, and Withering; but Mr. Smith says it is by no means to be claffed among our indigenous plants. Linnaeus observes it is very nearly allied to the *f timia*; and Haller remarks that the calyx is sometimes two-flowered, but that the awn is neither twifed nor jointed. We are told the seeds have been cultivated, and for the uses of the poor answer all the purpozes of oatmeal. 8. *A. fistulosus*, wild oat or haver. Hudf. With Smith. Brit. 153. Matt. Fl. Ruth. 81. *Panicled*; calyxes mostly three-flowered; florets awned, and hairy at the base. Annual; culm erect, single, three feet high, a little leafy, fringed, very smooth; leaves linear, patent, nervoos, bristly; nervation thin, nervos, smooth; fistules oblong, toothed, lacerated; panicel erect, much branched, and spreading; peduncles alternate, capita, branched, bristly, thickened towards the apex; rachis, acutus, calyces glumes equal, lacerated, smooth, longer than the florets; florets for the most part three, remote, gradually diminishing, roundish, beaf with tufts of hair at the base, armed from the middle of the back, awn twice the length of the calyx, rough, jointed, twifed at the end; interior glume conceave, naked, ciliated. Seed has a soft hairy covering. It grows in fields and hedges, and is one of our most destructive annual weeds among corn. The awns are sometimes used for hydrometers, and the seeds instead of artificial flies, in fishing for trout. 9. *A. pratensis*. Schen. Gram. 220. t. 4. f. 17. *Panicled*; calyxes mostly three-flowered, all the florets armed; receptacle bearded. *Panicled* oblong; the flowers appear to be hairy, but all the hairs fall on pedicels or receptacles within the calyx among the flowers. The third flower is imperfect. Haller thinks it to be only a variety of the *f timia*. A native of Germany, Switzerland, &c. 10. *A. poaefcus*, soft oat-grafs. Hudf. With Smith. *Panicled erect*, almost simple, calyxes commonly three-flowered, receptacle bearded, leaves flat, pubescent. Perennial; culm one or two feet high, erect, simple, roundish, smooth, frnated, leafy; leaves spreading, short, oblong, flat, which together with the flictus are covered with a soft down; simple, short, deted; panicel contracted for 10 to appear like a spike; calyces glumes very uneaual, keeled, febrous, pointed, membranaceous, naked; interior very long, three-nerved; florets three, the third often abortive, remotif, clubbed-cylindrical, narrow, roundish; dispharous, armed towards the middle of the back; interior glume smaller and weaker, rough at the edge; common receptacle elongated above the floclet, beaf with white hairs. It grows in dry meadows and chalyce pastures, flowerins in June. 11. *A. f timia*, great wild, or beard oat-grafs. *Panicled*; calyxes three-flowered; the outer florets and awns hairy at the base, the inner ones awnless. Annual; culms three or four feet high, smooth; leaves smooth, flat, sharp, very long; flowers pendulous; calyces four or five-foved; valves lanceolate, acuminate, concave, equal, smooth, white with green breaks. In the two outer florets, the outer valve of the corolla resembles a valve of the calyx in form but shorter, and puts forth an awn two inches long. The other florets are awnless. A native of Barbary and Spain. Curt. Lond. 3. t. 5. 12. *A. foae foae*, yellow oat-grafs. Hudf. With Smith. Curt. Lond. 3. t. 5. *Panicled much branched, boole, calyxes mostly three-flowered, unequal, receptacle hairy; leaves flat, subpubescent*. Culm erect, but curved at the base, a foot and a half high, frnated, jonted, leaves flat, acute, frnated, more or less pubescent; *panicel* somewhat nodding, spreading, branched very much, many-flowered, of a shining gold colour; calyces glumes acute, keeled, febrous on the back, one twice the size of the other, three-nerved; florets two or three, remotif lanceolate, compressed, fuffury nervos, awned; anse twice the length of the floret, febrous; interior glume narrower; receptacle hairy. It grows in meadows, pastures, and the sides of roads, flowerins in June and July. In many of our counties, this species forms the principal part of the finest pasturage on the downs, and in some meadows it contributes to the goods as well as the meats of the crops. 13. *A. hispida*. "Panicled; calyces three-flowered, hairy." Culm a foot high, smooth; fuffury hairy; panicel or raceme with undivided pedicels, three or four; glumes oblong, acuminate, hairy, uprefit; corollis awnless; awns twifed, twice or three times the length of the flowers. 14. *A. repens*. "Panicled contracred; calyces three-flowered, frubulbe; corolla pubescent; middle awn twifed, curved." Culm a foot high; leaves long; calyces glumes equal, lacerated, smooth, longer than the florets; florets for the most part three, remote, gradually diminishing, roundish, beaf with tufts of hair at the base, armed from the middle of the back, awn twice the length of the calyx, rough, jointed, twifed at the end; interior glume conceave, naked, ciliated. Seed has a soft hairy covering. It grows in fields and hedges, and is one of our most destructive annual weeds among corn. The awns are sometimes used for hydrometers, and the seeds instead of artificial flies, in fishing for trout.
short, like those of foxties ovina; panicle small; glumes of the calyx purple; valves lanceolate, keeled, smooth; all of the florets are awned, and covered with a white down. A native of Martincio. 16. A. lutea. "Panicle spreading; calyxes two-flowered; glume bifid; corolla naked, three-awned, middle awn flexuose." This renews aids flexuosa both in habit and colour. A native of Martincio. 17. A. lupulina. "Panicle contracted, ovate; calyx three-flowered, lanceolate; corolla villose, outer glume bifurcate; middle awn reflex." This is not readily distinguished from the 15th. It is larger, with feathers extremely tomentose. Panicle yellow, closely crowded; flowers longer than those of the 15th, with the corollas bifid and more hirsute; the divisions furcate, awned. A native of the cape, found by Thunberg. 18. A. frigida, brittle oat-grafs. Schreb. Gram. t. 24. "Spiked; calyxes four-flowered, longer than the floret." Culms many; smooth, with three to fifteen, fix or fewer inches high; leaves flat, ciliate: spike the length of the culm; flories in a double row, profuse clove, red alternate; calyx two or four-flowered, laticial, oblong, pubescent; one valve twice the length of the other; outer valve of the corolla sharp, with an awn from the back. This is the only avens truly spiked. A native of Spain. Introduced by Monf. Richard, in 1770. 19. A. pratensis, narrow-leaved oat-grafs. Huds. With. With. Smith. Gramen aven, &c. Ray. Syn. t. 21. f. 1. ed. 2. 252. n. 2. & 3. Schreb. Agr. 250. "Spica erect; calyxes moftly five-flowered; receptacles hairy; leaves involu- cate, furcate, naked." Root perennial; culms many, a foot or a foot and a half high, crisp, fimple, with a single joint near the base, above naked, ftirted, roughrid; radial leaves linear, acute, rigid, incurved, smooth on both fides, with the edges furcate-fabrous; thick on the culms broaded, nervo; with long fheaths which are nervo;e and smooth; ftipule lanceolate; spike erect, commonly very fimple; upper spikelets fuble; under one long, pedunculated; calyx glumes furcate, acute, three-awned, a little keeled, flabrous of the length of the lower florie; flories four or more, fubfutuca, roundifh, roughrid, neruo; at the apex, membranaceous, lacerated, avned from above the middle of the back; awn double the length of the floret, purple, with a white apex; interior glume smaller, very flider, minutely ciliate; receptacle under the flories, beft with fhort hairs. It grows on dry paths and heaths, fowering in July. 20. A. fpatiata. "Spiked; calyxes fix-flowered, longer than the outer petal, which is awned and forked at the top." Spike compounded of three or four remote upright spikelets; flowers fix, felfe, upright; calyx fubfutuca, equal, longer than the spikelet; outer petal bitd at the top, with a jointed awn between the divisions, the length of the spikelet. It has the habit of felguga decumbens. A native of Pennsylvania. 21. A. bromidodes, Gr. alpinum aven, &c. Schreb. Gram. 228. t. 4. f. 21. "Subspiked; fpikelets binary, one peduncled; awns diverfate; calyxes eight-flowered." Two feet high; culm flider; spikelets round, general in pairs, one felfe, the other peduncled; calyx from four to eight-flowered; awns from the middle of the back, twifled. A native of Switzerland, and about Montpellier. 22. A. frigida. "Panicle; calyxes two-flowered; corolla fMOOTH at the base; outer valve ending in two awns, shorter than the valve, and with a bent awn from the back." Annual; culm and leaves bare; peduncles from one to four, rough; calyx the length of the fiores; valtes seven or ten-rigbed, bordered with a row of minute dots; valve of the corolla fMOOTH below; segments terminating in purple awns white at the tip; seeds hairy. This has been found growing with the cultivated oat, but it is not native of this country. See Smith. 23. A. aurata, golden oat-grafs. "Calyces two-flowered; panicle scattered, erect; corollas golden, villous at the base." A handsome grafs, nine inches high; leaves very flider, brittle-leaved; panicle stiff, with mucronate spikelets, one shorter than the other; corolla elliptic, pubefcent at the base; top plaited, ferrate; at the base of the outer glume, a jointed awn, longer than the flower. When this grafs arrives at maturity, it is of a refluent golden colour. A native of the Alps, of Switzerland, and Piedmont. 24. A. scheuchzeri. Scheuch. Gram. 23. t. 3. "Spikes five-flowered, pubefcent at the base; peduncles branching." Culm from six to twelve inches high; leaves fMOOTH, two lines broad, keeled; panicle narrow like a spike; calyx purple, thinning, curved at the top; glumes unequal, mucronate; outer glume of the corolla mucronate, green, variegated with bay and gold colour; inner with a golden and filver colour, membranaceous, awn long, brown, jointed, twifled. A native of the fame place as A. aurata. 25. A. illyricus. Forst. Flor. n. 46. "Panicle erect, very flider; calyxes one-flowered; awns twice the length of the calyx." A native of New Zealand and Eaftern Island.

Propagation and Culture. For the gralls, see GRASS. Oat. The best time for fowing oats is in February or March, according as the fefon is early or late. The black and red oats may be fown a month earlier than the white, because they are harder. The advantage of early fowing is proved by experiment to be found in the papers of the Bath Agricultural Society. White oats fown in May have produced seven quarters the acre, and in Hertfordshire they do not fow them till after they have done fowing barley, which is found to be a good practive; this oat being more tender than the others. Mr. Marshall mentions the blowing of the fallow as a direction for the fowing of this grall. He fays "most people allow four buhels of oats to an acre, but I am convinced, that three buhels are more than enough; the ufual prufide is about twenty-five buhels to an acre, though I have sometimes known more than thirty." But forty buhels and more are certainly no unfual crop. It appears from Mr. Young's "Tour through the Southern Counties," that the quantity of oats fows varies from five buhels two pecks to two buhels and a half, and that the produce is as follows:

<table>
<thead>
<tr>
<th>Produce</th>
<th>Q. B. P.</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 buhels and upwards</td>
<td>4 0 6</td>
</tr>
<tr>
<td>4 buhels</td>
<td>4 2 2</td>
</tr>
<tr>
<td>4 to 5 buhels</td>
<td>3 6 0</td>
</tr>
<tr>
<td>3 buhels and a half</td>
<td>2 0 2</td>
</tr>
<tr>
<td>2 buhels and a half</td>
<td>2 0 0</td>
</tr>
</tbody>
</table>

He thinks the quantity of feed should be proportioned to the poverty of the ground; for in rich land corn tillers to much as apparently to cover the field; but in poor land it does not tiller at all, consequently the grains should be so much nearer. Mr. Young, in his "Northern Tour," gives another table of the different quantities of feed corn, with their respective average produce, as follows:

<table>
<thead>
<tr>
<th>Produce</th>
<th>Q. B. P.</th>
</tr>
</thead>
<tbody>
<tr>
<td>7 buhels fown, average produce</td>
<td>6 0 3</td>
</tr>
<tr>
<td>6 buhels</td>
<td>4 0 1</td>
</tr>
<tr>
<td>5 buhels</td>
<td>4 0 2</td>
</tr>
<tr>
<td>4 buhels and a half</td>
<td>4 0 5</td>
</tr>
<tr>
<td>4 buhels</td>
<td>4 0 4</td>
</tr>
<tr>
<td>3 buhels</td>
<td>4 0 3</td>
</tr>
<tr>
<td>2 buhels</td>
<td>4 0 2</td>
</tr>
<tr>
<td>Or thus:</td>
<td>4 0 2</td>
</tr>
<tr>
<td>6 and 7 buhels</td>
<td>6 0 2</td>
</tr>
<tr>
<td>4 buhels and a half and five</td>
<td>4 4 3</td>
</tr>
</tbody>
</table>

Hence it appears, that although some points remain doubt-ful, yet the superiority of fix or seven buhels is fo great, that there is abundant reafon to think the other quantities are not equal to these in advantage, and that the modern ide
ideas of sowing small quantities of seed are not universally to be adopted. Mr. Young therefore recommends that experiments should be tried on all sorts of soils, and in every situation, on small pieces of land, to decide this important point.

APONAE, in Entomology, a species of Musca, of a black colour and shining; eyes brownish; wings red and greenish. Inhabits Sweden. Gmelin, &c.

APONAGE, formed of the Latin avveno, out; in Latin, a certain quantity of oats paid to a landlord in lieu of some other duties, or as a rent, from the tenant.

APONAY, in Geography, a town of France, in the department of the Marne, situated on the river Marne, one league and a half north-east of Epernay, and five W. N. W. of Chalons-sur-Marne.

APONCHE, or APRONCHE, a town of Switzerland, in the canton of Bern, and the principal burgh of a bailiwick in the Pays de Vaud. Some contend that it was the capital of Helvetia, because Tacitus (Hist. l. i. c. 68) calls it "Aventicum gentis caput;" while others have endeavoured to prove that by this expression the historian only intended to denote the capital town of its particular district. According to some accounts, the city was built, and a Roman colony founded, by Vepstatian; but with greater probability, according to others, it was only repaired and beautified by Vepstatian, after it had been laid waste and almost ruined by Cæcina, one of the lieutenants of Vitellius, when many thousands were slain, and many thousands sold for slaves. It was afterwards taken and pillaged by the Burgundians; and reduced to a heap of ruins by the Franks. Without doubt it was formerly a very considerable town, and subject to the dominion of the Romans, as we may conclude not only from several mile stones found in many parts of the Pays de Vaud, most of which are numbered from Aventicum, as the principal place of reference, and more particularly from the present ruins. The ancient walls appear to have inclosed a space near five miles in circumference; of which the present town occupies but a very small spot; the remainder being covered with corn fields and meadows. In an adjoining field is a Mosaic pavement, which was the floor of an ancient bath, about sixty feet long, and forty broad; consisting of three compartments, in which are represented human figures in various attitudes, but chiefly bacchantes. From a glory that surrounds the head of Bacchus in this Mosaic, it has been inferred that it was wrought during some part of the intervening age between Vepstatian and Marcus Aurelius; because that mark of divinity is not usual upon monuments of Roman antiquity before that period. Besides, the head-dress of a Bacchic lady is represented in this Mosaic, resembling the head-dresses of the empresses Plautina and Sabina. The ancient amphitheatre appears from the ruins that remain, to have had an arena of about 80 yards in diameter; and under a tower is a cell from which the animals were probably let loose upon the arena. On the outside, remains of five doors are visible; and the walls are adorned with several pieces of rude sculpture dilapidated. Not far from these ruins stands a column of white marble about sixty feet high, composed of large masses neatly joined without cement; and near it lies a considerable fragment of d-bayed sculpture, which seems once to have formed part of the portal belonging to a magnificent temple. There are also several other relics of the ancient extent and grandeur of this place. Cooxe's Travels in Switzerland, vol. ii. p. 175, &c. Avenche is situated at the south end of the lake Morat, 16 miles south-west of Bern. N. lat. 46° 50' E. long. 7° 7'.

APONIA, in Botany, denote leaves which have no visible veins.

APONIO, now AVIGNON, in Ancient Geography, a town of Gallia Narbonensis, upon the left bank of the Rhone. See AVIGNON.

APONNE, a town of France, in the department of Oute, and chief place of a canton in the district of Huy. The place contains 175 and the canton 11,016 inhabitants; the territory includes 156½ square kilometres, and 30 commune.

APONOR, in Antiquity, an officer under the master of the horse, who by order or warrant from him, made up the accounts of the stables, and issued debentures for paying the officers and farmers.

In a flat, Car. II. we find the avenor mentioned as an officer who provides oats for the stables. In the Rot. Parl. Edw. III. we also read of avenor of the queen, of the prince, &c.

APONACE, in Biography, a philosopher among the Spanish Saracens, who flourished about the middle of the twelfth century, and was a follower of Aritotles. He wrote a commentary upon Euclid, as well as philosophical and theological epistles. He was intimately conversant with the Peripatetic philosophy, and applied it to the illustration of the Islamic system of theology, and to the explanation of the Koran; and on this account he was suspected of heresy, and thrown into prison at Cordova. It is said that he was poisoned at Fez, in the year of the Hegira 553, A.D. 1158; or, according to others, 525, A.D. 1130. Pococke Spec. Hist. Arab. p. 373. Gen. Dict. Among the Arabian writers he is commonly known by the name of Ebn al Sâyeâh; and was born in Spain, of Jewish ancestors.

APONES, in Botany, See GEUM.

APONIA, in Ancient Geography, a river of Italy, in the Sabine territory, which discharged itself into the Tiber, and which is supposed to have given the name of Ager Aventinus to the neighbouring district.

APONIA, in Ancient Geography, a river of Italy, in the Sabine territory, which discharged itself into the Tiber, and which is supposed to have given the name of Ager Aventinus to the neighbouring district.

APONIA, in Botany, See GEUM.
AVENTURÉ, in our Ancient History, signify tournaments, or military exercises on horseback.

AVENTURE, or rather ADVENTURE, in our Law Books, a mischance, causing the death of a man, without felony; as, when he is suddenly drowned, or burnt by an accident or mischief, falling into the water or fire. See ACCIDENT, and CASE-MEDLEY.

AVENTURE, in Mineralogy. See QUARTZ, and FELSAR.

AVENUE, formed of AVENIR, or ADVENT, to arrive at, in Fortification, an opening or inlet into a fort, battery, or the like place; or the pafles and ways to and from it. See BATTERY, and EASTERN.

AVENUE, in Ornamental Gardening, is a large and generally straight walk, bounded on each side by one, two, or more rows of forest or other trees, designed sometimes as a principal way from the common road to the manor-house of a country seat, and often to form views, or to lead to different districts of the neighbouring country. But though avenues of the more regular kind, when formed about extensive forts, or detached in parks, or other extensive pleasure-grounds, always exhibit an air of grandeur, it is more agreeable to the present taste to have the principal front of the mansion entirely open, and unencumbered with these or any other kind of plantation, as it is certainly a great absurdity to hide a good front, and obstruct the prospect; an avenue can therefore seldom be admitted with propriety in that part of the ground. A spacious lawn of grass should, as frequently as possible, be exhibited in due extenion in the most conspicuous fronts of such dwellings. See LAWN.

But in directions from the wings, detached at considerable distance, avenues may perhaps with propriety be occasionally introduced, and extended on the sides of spacious lawns, serving by way of boundaries, being backed up next the lawns with shrubs and lower trees, disposed irregularly; and if they be carried in an oblique direction, the lawns will widen gradually, and the prospects be more comprehensive.

Avenues may also be admitted at some distance from either the ends or the back fronts of the dwellings, in either of which situations, one may be extended towards any common road, village, or town, serving as the common entrance to the invitation, or merely by way of ornament, &c. And in still more extensive situations, they may occupy different parts at a distance, being directed towards woods, groves, edifices, or particular districts about an estate; which, when formed of considerable width, and bounded on each side by a proper variety of trees, the noblest of the forest, and other kinds, afford a striking effect as well as an air of dignity to the site.

Avenues of this fort should always be planted with the flat-topped trees; an assemblage of the different forts of which effects the most agreeable variety.

The width of the avenue in such cases should seldom be less than forty feet; and when it is to be extended any considerable length, a hundred feet in width is not too much; when the two trees grow up, the branches on the opposite sides continue to approach each other, which by degrees gradually contract the views; so that if a considerable width be not at first allowed, the avenues in time appear narrow and confined.

The trees in the rows on the sides should be planted at least thirty feet distant from each other, that they may have full scope to display their heads, and each fort exhibit itself conspicuously, according to its natural form and habit.

The forts of trees most proper for this purpose are those of the deciduous tribe; as the elm, beech, Spanish chestnut, holly-chestnut, white poplar, fycamore, maple, walnut, wild-cherry, &c. all of which, as being of lofty growth, when disposed in a proper manner, will have a fine effect. Sometimes evergreen trees are used among these: where this is intended, the most proper forts are the various species of the pine, including all the different varieties of the fir, most of which attain a great height and magnitude, with beautiful spreading heads, that are extremely ornamental and pleasing.

Avenues of the more rural kind, such as common ways or walks through parks or other pleasure-grounds, to habitations, may be continued either in direct line, or carried round in a moderate sweep, or the course directed to the right, or left, or more, very gentle bends, or easy serpentine turns, each side being ornamented with different sorts of trees, thinly dispersed, some singly, others in clumps or groups, of two, three, or more together, exhibiting them variously, some breaking forward, others standing more backward; and, for the full greater divaricacy, a clump of tall flowering shrubs may here and there be introduced; having the whole so considerably detached, as to admit a full prospect of the adjacent lawns, fields, or plantations, in the whole extent. This is the most modern method of forming avenues, but it cannot be practised with full effect except where the situation is of considerable extent. In short, in walks and confused situations, the row method is mostly to be preferred, as having a better effect.

All the trees that are employed in this way, whether deciduous or evergreen, should be permitted to take their natural growth, without being much cut or pruned.

AVENZOAR, whose true name was Abu Merwan Abdelmelech Ibn Zohr, in Biography, was the son of a physician of considerable eminence of Seville in Spain, under whom he received the first rudiments of his education, which he afterwards improved by close application and by travel. He appears also to have had the care of an hospital, and to have acquired an uncommon share of knowledge for the age in which he lived, both in the theory and practice
practice of medicine. He was for some time under the displeasure of Hali, the governor of Seville, by whom he was imprisoned, but soon at length to have surmounted all his difficulties, as he was made physician to King Almanzor, in which post he continued probably to the end of his life. He is said to have died at Morocco in 1166, at the great age of 135 years; though it is probable the age of his son, who succeeded to his fame and practice, is included in this term. From a manuscript in the Eicurt (Bib. t. ii. p. 152), cited by Dr. Ruffell in the appendix to his "History of Aleppo," vol. i. p. 30, it appears that Avenzoar died at Seville, and not at Morocco, about the year 1162; and if it be true, that he had lived to the age of 135 years, and began to practice very young, he must have made a figure in the 11th century, and been born eight or nine years before the death of Aviceuna. He prepared his own medicines, reduced luted bones, and performed other chirurgical operations, but did not cut for the stone; the Mahometan religion, which he professed, prohibiting him from inspecting or handling the naked genitals.

On the work by which he is principally known, called "Al Theifer," is a compendium of the practice of medicine; in which some diseases are described, not found in other writers. It includes a number of cases, candidly, it should seem, related, as the author does not conceal those in which he was unsuccessful. Averhsores, not ordinarily profuse in his commendation of other writers, speaks very favourably of our author, whom he esteemed as the best physician that had appeared since the time of Galen. From his active and inquisitive turn of mind, and the pains he took to learn from practice the real powers of the medicines he used, he was called the "Experimenter."

AVER, in Agriculture, a general name, in some districts, for a labouring beast of any kind.

AVER, in Geography, a river of Lithuanian Russia, which runs into the Pregel, twelve miles west of Inflenburg.

AVER, in Ornithology, the name of the variegated chatterer (Amelius variegatus, Gmel.), in Buffon's Histoire of Birds.

AVERBACH, in Geography, a town of Germany, in the circle of Upper Saxony, 14 miles south of Zwickau, and 60 W.S.W. of Dresden. N. lat. 52° 26'; E. long. 12° 26'.

AVER-CORN, in Ancient Writings, such corn as by custom is brought by the tenants' carriages, to the lord's granary.

AVERDUPOIS Pound. See Pound.

AVERDUPOIS Weight. See Weight.

AVERHAHN, in Ornithology, a name assigned by Frich, Bloch, and others, to the woods grouse, or mountain cock, tetrio urogallus of Linnaeus.

AVERIA, in our Law Books, properly signify oxen or horses used for the plough; but, in a general sense, any cattle; and sometimes the term included all personal estate. When mention is made of one beast, they say, quidem equus, vel quidem bovis: when of two or more, they do not say, equi vel bovi, but averia.

AVERIA, in Commerce, a branch of the Spanish revenue, denotes a tax paid on account of convey to guard the ships falling to and from America, which was first imposed when Francisco Drake Eled the New World with terror by his expedition to the South sea. It amounts to 2 per cent. on the value of goods. Robertson's Amer. vol. iii. p. 499.

AVERIA, Replegari de Aversa. See REPLEGIAR.

AVERIIIS capit in Hist. rerum, in Lat. a dict the taking of cattle to the use who hath cattle unlawfully driven by another, and driven out of the county where they
not what is against presumption of law or any thing apparent to the count. Co. Litt. 362. 373. By bat. 4 & 5. Ann. c. 16, no exception or advantage shall be taken upon a demurrer, for want of a peremptory paratus of. &c. except the same be specifically set down for cause of demurrer.

AVERN, among the Ancient Naturalists, certain lakes, grovets, and other places, which infect the air with poisonous fumes or vapours; called also nephtes.

The word is formed of the privative av, and avdos, bird, as intimating that birds could not fly over them, but dropped down dead. Avernus, q. d. avernos, loca fine avidis.

Avern is said to be frequent in Hungary, on account of the abundance of mines therein. The Grotto del Cani, in Italy, is a famous one. But the most celebrated Avernus was a lake near Baiae, in Campania, by the modern Italians called Lago di Tripergola, and situate in the county of Lavori in Naples, near Pozzuo, and said to be about 600 yards in diameter, and in some places 188 feet deep. — The fumes it emitted are represented by the ancients, to be such as malign a nature, that birds could not fly over it, but sunk down dead; which latter writers have chosen to attribute to this, that it is full of an effluvia not being of confidence to sustain the birds, they dropped by their own weight into the water. This circulation joined with the great depth of the lake, occasioned the ancients to take it for the gate or entrance of hell; and accordingly Homer brings Ulysses to Avernus, as to the mouth of the infernal regions; and in imitation of the Grecian bard, Virgil makes Aeneas descend this way into the same abodes. —

Vibius Sequelser says, that no bottom of it has been found. (See HEL.) Next to the Baiae (fays Strabo) lies the Lucrine bay, and within it the lake Avernus; which is a deep darksome lake, with a narrow entry from the outer bay: it is surrounded with steep banks, that hang threatening over it; and is only accessible by the narrow passage through which you fall in. These banks were anciently quite overgrown with a wild wood, impenetrable by a human foot. Its gloomy shade impressed an awful superstitious upon the minds of the beholders: whence it was reputed the seat of the Cimmerians, who dwelt in perpetual night. Whoever failed hither, felt offered facialis; and endeavoured to partake the ancient ceremonies, with the assistance of some priests, who attended them on their way in. This circumstance, joined with the great depth of the lake, occasioned the ancients to regard it as the gate of hell. Within, a fountain of pure water broke out, just over the sea: but no creature ever tasted of it, believing it to be a vein of the river Styx: somewhat near this fountain was the oracle: and the hot waters frequent in these parts, made them think they were branches of the burning Nilegethon.

The holids of these shades (fays a modern traveller) remained unspoken for many ages. Hannibals marched his army to offer incense at this altar; though, perhaps, he was led to this act of devotion, rather by the hope of inspiring the garrisons of Petoli, than by his pious. After a long reign of undisturbed gloom and celebrity, a sudden change of light was let in upon Avernus: the horrors were dispelled, and with them vanished the faculty of the lake: the axe of Agrigita brought its force to the ground, disturbed its steepy waters with limbs, and gave room for all its malignant effluvia to escape. The violence of these evolutions is described by ancient authors as very extraordinary; but modern writers, who know the fable very well in a clear light, charge these accounts with exaggeration; and yet it must be owned, they did change some form, as the air is ever new, and dangerous, which the jaws that biteth the veins of those who have succeeded the Sobys and Cimmerians in the possession of the temple, must ruefully tell. Bocceato relates, that during his residence at the Nepolian court, the surface of this lake was suddenly covered with dead flies, etc.

Vol. III.
half a mile distant, from which these animals might be supposed to have derived "their origin, were it not that the frogs of that lake are of a totally different species." Upon the whole this ingenious naturalist concludes, that the presence of these creatures in this place was to him an enigma, which it required a longer stay in this volcanic country to enable him to solve.

The cave, called the Sibyl's Grotto, near Avernus, which is opposite to the temple, seems more likely, as Mr. Swinburne apprehends, to have been the mouth of a communication between Cumae and Avernus, than the abode of a prophet; especially as the Sibyl is positively said by historians to have dwelt in a cavern under the Cumaean citadel. Some have conjectured that it was part of the canal absurdly projected by Nero, from the mouth of the Tiber to the Julian port. On every hill, and in every vale of these environs, appear the ruins of extensive villas, once embellished with all the elegancies of combined art, but now traced only by half-burned moulidng walls, and some marble fragments, the remaining indications of the tale of coltines with which they were constructed. Among the ruins of this country, one, in particular, claims attention; and this is the villa in which Cicero had his academy, where he penned some of his most admirable productions, and which probably stood on a spot covered by the eruption of 1535.

AUEROCHS, in Zoology, a synonymous name of the wild ox, given by Gœthe and Ridering. See Bos Ferus.

AVERON, in Geography, an island in the North sea, near the coast of Norway. N. lat. 63° 6'. E. long. 7° 44'.

AVERPENNY, q. d. Average-penny, in Antiquity, money contributed towards the king's average, or money given to be freed thereof. See AVERAGE.

AVERROEA, in Botany, (to named after the famous commentator on Aristotele and Avicenna; commonly called Averrhoes, of Corduba, in Spain; his "Colliget," or the plates used in food, &c. was written about the end of the twelfth century). Linn. g. 576. Schreb. 784. Jull. 375. Clafs, decandria pentagonia. (Passonaria, Lour.) Nat. Order, graminaceae. Jull. Gen. Char. Col. perians five-leaved, erect, small; leaflets lanceolate, permanent. Cor. petals five, lanceolate, the lower part crenat, the upper spreading. Stam. filaments ten, fuscous, alternately the length of the corolla, and shorter; anthers roundish. Péj. germ oblong, obscurely five-cornered; styles five, fuscous, erect; stigma simple. Pé. pome turbinate, five cornered, five-celled; seeds angular, separated by membranes.

Species. 1. A. Bilahea. Rumph. Amb. t. 118. t. 36. Rhed. Mel. 3. 35. t. 43. 45. Lour. Cœchlin. 289. "Trunk naked, fruit-bark g." Lour. Cœchlin. 289. A tree about eight feet in height, with few ascending branches; leaves pinnate, with ten or more pairs of leaflets; flowers on racemes adhering to the trunk, of a red purple colour; calyx five-cleft; fruit an oblong pome, the thickfleshed of a finger, smooth. A native of Cos, and of both sides of the Gauges. 2. A. Carobolidae, Rumph. l. c. t. 35. Rhed. l. c. t. 45. 44. Phil. Trav. vol. 75. Lour. l. c. "Axille of the leaves fruit-bearing; pomes oblong, acute-angled. This is a tree above the middle size, with spreading branches, and a very close head; leaves with about four pairs of leaflets, which are ovate, acuminate, entire, opposite, the upper ones largest; flowers lateral, on short racemes; corolla bell-shaped, variegated with purple and white; famous always five; pome the
the size of a hen's egg, with a yellow rind. Dr. Bruce gives a curious detail of the sensibility of the petals and even branches of this tree. The fruit of both the species affords a pleasant acid juice, especially the former. The Bramius and Portuguese call this tree carambola; in Malabar it is named tamar-tonga; and in Bengal, camrue, or camrum. Both these Indian trees have been introduced into the Kew-garden.

Averrhoes, or Averroes, or Abu Al Walid Mohammed Elia Abul Elia Rosli, in Biogaphy, an eminent philosopher and physician, was born about the middle of the twelfth century, at Corduba, the chief city of the Saracens in Spain, where his grandfather and father had occupied the posts of chief priest and chief magistrate. The first care of his education was entrusted to Theophilus of Seville, who instructed him in the Islamic law; and after the manner of the Arabian schools, in the Mahometan theology, connected with the Aristotelian philosophy. Under Avenzoar he studied medicine; and under Umm-Sag, the mathematical sciences; and he connected himself with the Mahometan sect of the A fiscalites. Upon his father's demise, he was chosen to succeed him in the chief magistracy at Corduba. The fame of his talents and erudition having reached the caliph Jacob Al-Manfor, king of Mauritania, he was appointed by this prince supreme magistrate and priest of Morocco and all Mauritania, and allowed to retain his former honours. Averroes accepted the appointment; and having provided a substitute at Corduba, removed to Morocco, and continued there till he had instituted, through the kingdom, judges well skilled in the Mahometan law, and settled the whole plan of administration. He then returned home, and resumed his offices. This rapid advancement excited the envy of his rivals at Corduba; and, in order to justify an accusation of his having deserted the true Mahometan faith, they engaged a number of young persons to make a full instruction in philosophy, that they might detect his heresy. Averroes frankly communicated his theological sentiments, of which they took minutes for the use of his accusers. Accordingly, a charge of heresy was filed upon oath, and signed by one hundred witnesses, was conveyed to Al-Manfor. The caliph admitted the accusation, and proceeded to punish him by an order for the confiscation of his goods, and by requiring him to reside in those precincts of Corduba which were inhabited by the Jews. Here he became an object of general obloquy and persecution; and he was pelted by the boys in the streets, whenever he repaired to perform his devotions at the mosque of the city. His pupil Maimonides, in order to prevent the necessity of joining in this general outcry against him, left Corduba; and Averroes himself at length finding means to escape, fled to Fez; but here he was soon discovered, and committed by the magistrates to prison. The king, as soon as he heard of his flight, convened an assembly to deliberate upon the measures which were proper to be pursued against this heretic. In the assembly, a diversity of opinions was heard; some recommended death, and others public penance and a recantation of his errors. Al-Manfor approved the sentiments of those who were most mild and moderate in their judgment; and Averroes was conducted, at the time of public prayers, to the gate of the mosque; and being placed upon the upper lip, every one that passed was allowed to spit upon his face. At the close of the service, he was interrogated by the judge, accompanied by his attendants, whether he repented of his heresies. Averroes professed his penitence, and was released. During his continuance at Fez he opened a course of lectures on the civil law; but finding little encouragement, he obtained leave of the king to return to Corduba, where he experienced all the miseries of poverty and contempt. The people, however, dissatisfied with the

regent who had succeeded him, petitioned the king that their former governor might be restored. Al-Manfor, unwilling to act on his own judgment, called a general assembly, and it was determined, that the present heretic should be restored, by the royal mandate, to all his former honours. In consequence of this fortunate change in his circumstances, Averroes removed to Morocco, taught in its schools, and spent there the remainder of his days. According to Leo Africanus, his death happened in the year of the Hegira 603, A. D. 1206; others say that he died about the year 1198.

This philosopher has been highly celebrated for his personal virtues. Such was his temperance, that he partook only once in the day of the plainest food. In his application he was unceasing and indefatigable; allowing himself no other recreation in the course of the day than the change of fewer literary occupations for those of poetry or history, and spending whole nights in study. In his judicial capacity, he discharged his duty with great wisdom and integrity; and his humanity was such, that he could not pass sentence of death upon any criminal, but performed this office by his deputies. In the exercise of forbearance, meekness, and self-command, he was signal exemplar. When a servant, employed by an enemy, intruded upon him in one of his public lectures, and whispered some abusive language, Averroes, with perfect self-poise, turned round to him, and said, "Well well!" and proceeded with his business. This servant waited upon him the next day to implore his pardon for the insult he had offered him. "God forgive thee," said Averroes, "thou hast publicly shown me to be a patient man; and as for thine injury, it is not worthy of notice." He then gave him money, and dismissed him with this admonition; "what thou hast done to me, do not to another." In the exercise of liberality to men, Averroes made no discrimination between his friends and his enemies; and for his conduct in this respect, his apologists was, that in giving to his friends and relations, he merely followed the dictates of nature; but in giving to his enemies he fulfilled the obligations of virtue; and he also boasted that by this method he had converted enemies into friends. Upon the occasion of burning some amatory verses which he had written in his youth, he remarked, that when he was young, he was disobedient to reason; but now in his old age, he followed it; and he added this singular truth, that he had been born an old man: "utiam natus fulfem fenex." However, when he was requested to exercise his magisterial authority in the suppression of some licentious poems that had been published by a learned Jew, and informed that his own son had copied some of the verses, and that there was not a man, woman, or child in Corduba, who had not learnt some of the songs of Salahi, he exclaimed, "Can a single hand flop a thousand mouths?"

In philosophy, Averroes was an enthusiastic admirer of Aristotle, and yielded to the influence of deference to his authority; he even indulged his admiration in such an excess, that he ascribed to the writings of the Stagirite a degree of perfection "which is truly miraculous, and which proves him to have been rather a divine than a human being."—The doctrine of Aristotle," says he, "is the perfection of truth, and his undertaking attained the utmost limit of human ability; so that it might be truly said of him, that he was created and given to the world by divine providence, that we might see in him how much it is possible for man to know." This extravagance of admiration on the part of Averroes is the more surprising, as he was unacquainted with the Greek language, and was therefore obliged to peruse the writings of his oracle in wretched Arabic transliterations, taken immediately from Latin or Syriac versions.

T 2  His
AVE

His commentaries, however, though they abound with error, misrepresentation, and collision, have been held in such high estimation, ever since the revival of letters, that Averroës has been fliled by way of eminence, "The Commentator." Many of his writings in this way were so much admired by the Jews, that some of them were translated into Hebrew. Averroës also wrote a paraphrase of Plato's Republic; and a treatise in defense of philosophy against Al-Gazeli, intitled, "Habapala Altabapah," or "De Destructiones Destructorum?" the design of which was to confute the metaphysical opinions maintained against those philosophers, who affect two uncreated natures.

Though it is evident from the whole tenor of his life, that Averroës could have little time for the practice of physic, whose study, as well as several other writers, have supposed, that his knowledge of medicine was merely theoretical, yet we have the authority of his own words to prove, he was engaged in the practice also, though probably to no great extent. One observation (Friend says) we find made by him which does not occur in any earlier writer, is, that the same person could have the small-pox but once.* His principal medical work, the "Colliget," or "Universal," written at the command of the Miramadini of Morocco, is a compendium of physic, collected from the writings of other authors, with some not very material additions from his own stores. He wrote also a Commentary on the Cautics of Avicenna, which he calls the best introduction to the knowledge of medicine extant. This affords a complete answer to those who accuse him of having been jealous of the fame of that celebrated physician. As a proof however, that he regarded him as a rival, it is alleged that he avoids the mention of him, and in confuting a doctrine maintained by Avicenna, he treats it merely as the opinion of Galen. Besides the works above mentioned, Averroës wrote "De Veritate," "De Facibus," "De Thesauris," and "De Simplicibus Medicinis," all of which have been translated into Latin, and published in various forms. Averroës wrote many other treatises in theology, philosophy, jurisprudence, and medicine. In the Eufèbius catalogue (c. 41. p. 299.) mention is made of an index of his books, amounting in all to seventy-eight. His commentary on Aristotlē was published in Latin, at Venice, in folio, in 1495. An edition of his works was published in 4to., at Lyons, in 1587; another in folio, with the famous Latin translation, by Bagolii, at Venice, in 1552; and a third by Mofei, at Venice, in 1608. Of the MSS. prefixed in different libraries and particularly at Vienna, many are either Hebrew translations from the Arabic, or Arabic written in Hebrew characters.

As to the religious opinions of Averroës, he was by profession a Mahometan; but he does not seem to have entertained any great reverence for his prophet. It is related of him, that he called Christiandom an impossible religion, because it taught men to eat their god; similar to the instruction of the Doctor Ciceron De Nat. Deor, i. c. 16, when he considered, that the nature of men was expressly to feed, and that of Bacchus to wine: "Ecquent tum acentum esse putas qui illud, quo fecatur, Deum credit esse?" that Judæus, on account of its rites and ceremonies, was a religion for children; that Mahometism, offering only sensual rewards, was the religion of fowls; and that he exclaimed, "Let my soul, at death, be among the philosophers." It is also said, that he wrote against the three great law-givers, Moïse, Chrís, and Mahomet; and that he furnished materials for the book "De tribus Impostribus." His doctrine concerning the soul is supposed, not to have been peculiar to his own, but to have been affected by Aristotlē, and to have been embraced by Theophrastus, Simplicius, and Themestius; which was this, that intellect does not exist individually in this or that man, but that there is one intellect belonging to the whole race of human beings, the common source of all individual thoughts, as the sun is the common source of light to the world. Similar to this was the doctrine of Mulデン, who ascribed the production of ideas immediately to God, and taught that the human mind perceives God, and all things in him. Averroës, however, proceeded farther; and he seems to have conceived that there was no other cause of thought in individual men, than one universal intelligence, which, without multiplying itself, is actually united to all the individuals of the species, as a common soul. This notion, with its obvious consequences, as they concern the distinct existence and immortality of the human soul, obtained so much credit among philosophers for several centuries, and particularly in Italy, where their advocates were denominated "Averroists," that it was thought necessary to employ the papal authority for its suppression. At preseat, the notions of Averroës are exploded, and his writings are forgotten. Dr. Friend (Hist. Phys. p. 187) anxious to vindicate Averroës from the charge of infidelity, with regard to a future state, refers to two passages in his works, in one of which (Physic. Distrib. 32) he affirms, that the soul is not immortal; and in another, (Id. 4) that it is immortal. Leo. A. De. Vir. Illust. Arab. Gen. Dict. Brucker's Philos. by Enfield, vol. ii. p. 235, &c. Fabr. Bib. Graec. t. xiii. p. 55, &c. Friend's Hist. of Physic, vol. ii. p. 115, &c. Haller, Bib. Med. Pract.

AVEBROISTS, a sect of peripatetic philosophers, who appeared in Italy some time before the restoration of learning, and attacked the natural immortality of the soul; and who took their denomination from Averroës. The opinion of this sect was condemned by the last council of the Lateran, under Leo X.

AVERRUCATION, from averruca, I præm. in Agriculture, the act of cutting or lopping off the superfluous branches of trees. See Branching.

AVERRUNCT, from averruca, I præm. in Antiquity, an order of dukes among the Romans, whose peculiar office was to protect dukes and evils. The Greeks called these titles aleutris, a name that they were Hercules, Apollo, the Dioscuri, and Jupiter. The Egyptians had also their diame averruca, or apotropel, who were pictured in a menacing posture, and sometimes with whips in their hands,—this was a divinity of this kind; as is shown by Kircher. See God. p. Egypt. tom. iii. p. 487.

AVERSA, in Geograph. a town of Italy, in the kingdom of Naples, and territory of Lavora, the seat of a bishop, who is suffragan to the archbishop of Naples. This town was built and fortified A. D. 1029, by count Ruadulf, the first leader of the Normans, who came into Italy to seek their fortunes in the service of the Italian princes. The feast of this town was chosen, in a sacred district, as a central spot to which the Normans might resort, and where they might obtain a fixed settlement. Accordingly, it attracted every year new swarms of pilgrims and soldiers; some urged by recollection, and others by the hope of fame. The outlaws of every province associated with the settlers in this place, and were soon affiliated in manners and language with the Gallic colony. The spot was situated near the ruins of Arech, at the junction of two highways, that formed an easy communication with every part of the country, and from its being opposed to Capua, and from his aversion to Pandal, prince of that place, Ruadulf called it Averfa. This town was burnt to the ground by king Roger; and many years after, it underwent a similar fate, by order of Charles of Anjou. Its ancient palace, on the foundation of which a convent has been erected,
AVER, a river of Italy, which runs into the Adriatic, near Rimini.

AVERCOURT, Robert of, in Biography, an ancient English historian, flourished in the fourteenth century. He was register of the archbishop of Canterbury's court, and wrote a history of England in his own time, entitled, “Mirabilia Gestis Anglorum Dominorum Edwardi Tertii, &c.” As this history reaches only to the 30th of Edward III. A.D. 1356, the author was probably prevented by death from finishing his plan. He appears to have taken great pains in procuring the most authentic information; his facts are authenticated by original papers; his dates are accurate; and the defect of his style is compensated by his candour and impartiality as an historian. This valuable work has long been esteemed; till, in the year 1727, the indefatigable antiquary, Thomas Hearne, printed it at Oxford, from a MS. belonging to Sir Thomas Seabright, which had been formerly in the hands of archbishop Parker, and two other MSS., one in the Harleian library, and the other in the university library at Cambridge; all which are thought to be as old as the time when the author flourished. Mr. Tyrrell, in the preface to the third volume of his General History of England, cites this historian, and says, that he was a considerable writer of that age, and very exact in his account of King Edward's actions beyond the sea, as having taken them from several original letters of persons of note. To Hearne's edition is added an appendix, containing several curious pieces in English antiquities, unconnected with the work itself; and particularly, a transcript of the love-letters between Henry VIII. and Anne Boleyn, taken from the originals kept in the Vatican at Rome, A.D. 1582. Diog. Brit.

AVESNE, a town of France, in the department of the Baillaunds, and chief place of a canton in the district of St. Pol, three leagues west of Arras. The place contains 1221, and the canton 13,915 inhabitants; the territory includes 225 square kilometres, and 35 communes.

AVESNES, a strong town of France, is the department of the North, and principal place of a district. It is situated in Hainault, on the small river Hespe. Its fortifications were repaired by Vauban; and it was ceded to the French by the Spaniards in 1659. The place contains 9295, and the two cantons 18,785 inhabitants; the whole territory includes 510 square kilometres; and both cantons 17 communes. It is distant ten leagues east from Cambrai, seven from Valenciennes, and forty north-east from Paris. N. lat. 50° 7', E. long. 3° 48'.

AVETRON, a department of France, comprehends the northern part of the province of Guyenne; bounded on the north by the department of Cantal; on the east, by those of Lorraine and Gard; on the south, by those of Gard, Herault, and Tarn; and on the west, by those of Tarn and Lot. Its superficies is about 1,767,432 square acres, or 932,675 hectares. Its population consists of about 332,050 persons; and it is divided into two communes. It has its chief city is Rhôdey.

AVEZARAS, a river of France, in Gaufogny, waters the territory of Aire, and discharges itself into the Adour, between Gréymau and St. Sever.

AVEZZANO, a town of Italy, in the kingdom of Naples, and province of Abruzzo Ultra. This town, was founded in 860, and contains 2700 inhabitants. It is built on an almost imperceptible declivity one mile from the lake of Chone, to which an avenue of poplar-leads from the baronial castle, which is a square edifice flanked with towers, at a small distance from the town.

AUFEINO, a town of Italy, in the kingdom of Naples, and province of Abruzzo Ultra, twenty-one miles W.S.W. of Agripira.

AUFENA, or AUFENA, in Ancient Geography, Offena, a town of Italy, in Saturnia, belonging to the Velvani; south-east of Amiurenum.

AUFENTE, in Geography, a river of Italy, in the Cappadocia of Rome, has its source near Sezzu, and its mouth in the sea, near Terracina.

AUFFAY, a town of France, in the department of the Lower Seine, and chief place of a canton in the district of Dieppe, five leagues north of Rouen.

AUFIDENA, in Anti-nt Geography, Afidena, a town of Italy, in Saturnia, and the capital of the people called Caresseni, situated near Sagus. The inhabitants were called Auedinates.

AUFIDUS, a river of Italy, the most considerable in Apulia. For theouth of the description given of it by Pliny, see OANTO.

AUFINA, or AUFINUM. See AUFENA.

AUFENAY, in Geography, a small island of Swifterland, in the lake of Zürich, containing two churches.

AUGEA, in Ancient Geography, a town of Macedonia, in the Chalcidic territory. Ptolemy.

AUGALA, a town of Africa, in Mauritania Cazemriis, at some distance from the sea. Ptolemy.

AUGALI, a people of Asia, in Sogdiana. Ptolemy.

AUGARA, a town of Asia, in Asia. Ptolemy.

AUGARRAS, in Geography, a people of South America, in Brazil, in the province or government of Puerto-Seguro.

AUGE, in Entomology, a species of Sphinx (Zegenna Fabr.)
AUG

Fabra) of a black colour, with fanguineous hair on the sides of the abdomen; wings transparent, black behind; and the antennæ pectinated. Fabricius, Obs. This is Papilio euragus, of Cramer. It is a native of America.

Auge. This specific name Cramer has given to a variety of Papilio bolina. Linna.

Auge, in Geography, a district of France, in the late province of Normandy, extending from Falaise and Argentor, as far as the sea, between the rivers Dives, Vic, and Tongres, formerly giving name to a vicinage. Its productions are grain, flax, and apples. The pastures are rich and fatten the cattle that are brought hither from Picquou and Brittany.

AUGELA, in Ancient Geography, a town of Greece, in the Peloponnesus, written Augela, Augelia, by Homer, and supposed by Paulusinus to be the same with the small town of Aegia, situated on the coast of Laconia, and at the distance of thirty stadia from Githium. It had a temple consecrated to Neptune.

AUGELA, AUGELA, or AGUILA, in Geography, one of the Oases, or islands, in the eastern division of that ocean of sand, called the Great Desert, or Sahara, in Africa. It lies on the western part of the desert of Barca, and is separated from the kingdom of Tripoli by mount Meys. Although it is generally sandy and barren, it has some spots so well watered as to afford plenty of dates; and mount Meys has excellent pasture. In this territory, besides the town of Augila, or Augela, from which the canton takes its name, and which was one of the stations of the caravans that formerly carried on the sand trade of Africa, is another, seated at the foot of that mountain, called Siwah, Siouah, or San-Rey, which is the base on that side that belongs to the government of Tripoli. Augela lies in N. lat. 30° and E. long. 22°.

AUGENIO, HORACE, Dr. Monte Santò, in Ancona, in Biography, professor of medicine, born about the year 1527. He was early initiated into the knowledge of medicine by his father, Lewis Augenio, physician to pope Clement VII. Horace was first advanced to the chair of professor at Rome, which office he filled five years. He afterwards gave lectures with success at Turin; and in the year 1592, he was appointed professor at Padua; where he continued to the time of his death in 1603. Haller is diffident in his account of his works, which however were principally controversial, and not now much noticed. In his "Epist. et Confidt. Med." fol. Ven. 1590, he recommends millepedes, in calculous cæsae, by which, he says, he saw a boy cured, after he had been condemned to the knife; he forbids injecting the bladder in these cæsae, as frequently mischievous. He gave water, in which quicksilver had been boiled, for the cure of worms in the bowels; and in diabetes, he gave, he says, narcotics, with advantage.

AUGER, EDMUND, a French Jesuit, was born of poor parents, in 1530, at Alencon near Sainte, in the diocese of Troyes; and having received the rudiments of education under an uncle who was a clergyman, was sent by his brother, a physician at Lyons, to Rome, with a recommendation to the celebrated father Le Ferrer; but with a supply of money to beauty, that he was obliged to beg alms before he arrived to the end of his journey. Le Ferrer was dead before he reached Rome; and he was obliged to hire himself as a domestic servant to a Jesuit. In this humble situation his talents and conduct attracted the notice of his master, who procured for him, as a novice, the means of further instruction. In the order of Jesuits, to which he was admitted, he taught rhetoric and poetry, and manifested great powers of eloquence. His talents recommended him to a mission, employed by father Laynez, the general of the society of Jesuits, and dispatched to France, in the year 1559, for opening the progress of the reformation. On this occasion he distinguished himself by his zeal and success in the conversion of heretics; and he was appointed preacher and confessor to Henry III. His attachment to the king rendered him odious to the catholics who had entered into the league, and by an order of the general he returned to Rome, where he was treated as an excommunicated person, and obliged to travel on foot in the midst of winter. In the year 1591, he died in consequence of the fatigue and vexation which he endured, in the sixty-first year of his age.

Such was the closing scene of a man who is said to have converted 40,000 heretics. The intolerant spirit of Auger was sufficiently displayed in his work, intitled "Le Pèlagoge des Armées," designed to instruct a Carthusian prince, how to undertake, and happily complete a good war, victorious over all the enemies of the state and the church. Nov. Dict. Hiflor.

AUGER, in Geography, a small town of Ireland, in the county of Tyrone, and province of Ulster, which before the union, returned two members of parliament; but is now deprived of that privilege. It is distant seventy-five Irish miles north-west from Dublin.

AUGES, in Astronomy, two points in a planet's orbit, otherwise called apodes, See Apes.

One of the auges is particularly denominated the apogee, the other perige.

AVGHANS, in Geography, See Afghanis.

AUGHACLOM, a town and market town of the county of Tyrone in Ireland, seated on the river Blackwater, at the distance of 704 Irish miles from Dublin, on the high road from Londonderry. The linen manufacture is carried on briskly in its neighbourhood. N. lat. 54° 25', W. long. 6° 53'.

AUGHRIM. See Aghrim.

AUGIAN, a town of Ailsa, in the province of Aderbigh or Aiderbeitzan.

AUGIAN MS. Codex Augiensis, in Biblical History, is a Greek-Latin MS. of the epistles of St. Paul, which is however defective from the beginning to Rom. iii. 8, and the epistle to the Hebrews is found only in the Latin version. This MS. is noted F in the second part of Wetstein's N.T. It is supposed to have been written in the ninth century, and has taken its title from Augia-Major, the name of a monastery at Rheinau, to which it belonged at the time of the council of Basal. It was purchased by Bentley in 1718, for 250 Dutch florins, and is at present in the library of Trinity college in Cambridge, where it was deposited in the library of the younger historians, together with the other MSS. of the celebrated Dr. Richard Bentley. The Greek text is written in uncial letters and without accents; there are intervals between the words, and at the end of every word there is a dot. The Latin is written in Anglo-Saxon letters; whence it is inferred that it must have been written in the west of Europe, where that formation of the Latin letters, vulgarly called Anglo-Saxon, was in general use between the seventh and twelfth centuries. This MS. has been collated by Wetstein. Marsh's Michaelis, vol. ii. p. 210. vol. iii. p. 662.

AUGIAS, or Augeus, in Ancient History and Mythology, a king of Elis who was one of the Argonauts. Fabulous history reports that he had a flable, which contained a great number of cattle, as some say 5000 oxen, and which had...
not been cleared for thirty years, so that the exhalations which proceeded from it infected the country; and to cleanse it was considered as a work surpassing human effort. Hercules undertook the labour, and engaged to perform it in one day, on condition that Augias should give him a tenth part of the cattle. This work Hercules is said to have accomplished by making the river Alpheus to pass through the stable. Augias withheld the promised recompense; upon which Hercules flew him, and placed his son Phileus upon the throne, because he advised his father to fulfil his promise. This fable, however, is variously related by different authors. Hence has arisen the ancient proverb of "cleaning the stables of Augias," for expressing a difficult or impracticable enterprise.

Augias, in Lattomology, a species of Papilio (Hesperia Fabr.) The wings are silvery and fulvous, with an oblique band, and margin behind black. Fabricius.—Donov. Inf. India. Inhabits India.

Augicourt, in Geography, a town of France, in the department of the Upper Saone, and chief place of a canton in the district of Jully, 4½ leagues north-west from Vefoul.

Augiles, of Augilites, in Ancient Geography, a people of Africa, who inhabited the country by which the Carthaginians were separated from the Trogolodites. Pomponius Mela says, they were savages, who acknowledged no other deities besides the manes of their ancestors, whom they invoked on all interesting occasions. They are said to have slept upon the tombs, in order to receive the inspiration from which they derived the rules of their conduct. It was a custom amongst their women, to grant the first favour after their marriage to any who solicited it, and who made them presents; and they valued themselves upon the number of their votaries on this occasion. In other respects, says P. Mela, they were distinguished by their wisdom and affections.

Augit, Silex Augites, in Mineralogy, pyroxine of Haui; a var. of basaltic hornblend of Kirvva; sobor vol-
canique Daubenton, &c. Volcanite Lametherie.

The colour of this mineral is a very deep olive or pear green, which at first may be mistaken for a blackish green. It occurs sometimes in rounded fragments; but more usuall crystallized. Its varieties of figure are,

1. A foci-faced prism, of which two opposite ones are broader than the rest. The two bases, which are oblique, are terminated by wedges more or less obtuse.
2. A var. 1 with the edges that separate the small sides of the prism, truncated; or an eight-faced prism.
3. Two or more crystals connected by their lateral faces, so as to form a right or oblique-angled croid.

The crystals are generally small and very small, rarely of middling size. They are also, for the most part, unbedded. Externally, when no decomposition has taken place, the surface of the augite is smooth and shining; but when it begins to be decomposed, it becomes dull. Internally, it is shining or much shining with a greyish lustre. Its fracture is perfectly brittle, but it flies when broken into rhomboid parallelepipeds.

It is translucent on the edges, but rarely so throughout. It is hard, stratches glass, and gives fire plentifully with the steel; it is brittle, and easily broken. Sp. gr. 3.128—3.377.

The augite is not easily fusible before the blowpipe, but in small pieces it affords a black enamel. Its analysis by Vauquelin afforded

This mineral is found in basalt, with olivin and hornblende; it is also met with in certain amygdaloids. It abounds in Bohemia, and is found besides in Hungary, Transylvania, Tyrol, Helvia, &c.

It refits decomposition much longer than olivin; but not so long as basaltic hornblende. It is at length, however, reduced to a greenish yellow argillaceous mass, and not, as the olivin, to a ferruginous ochre. Brochant, vol. i. p. 179.

Augment, in the Greek Grammar, an accident of certain tenses; being either the prefix of a syllable, or an increase of the quantity of the initial vowels. There are two kinds of augment.—Tempore, or of a letter 7 when a short vowel is changed into a long one; or a diphthong into another longer one; thus called, because the time of its pronunciation is now lengthened: and augmentum syllabicum, or of a syllable, which is, when a letter, w, _i_, is added at the beginning of the word: so that the number of syllables is increased.

Augmentation, in Mathematics. See Fluxions, and Mo-

Augmentation, in a general sense, the act of augmenting; that is, of adding or joining something to another, to render it larger or more considerable.

The governors of the bounty of Queen Anne, for the augmentation of the maintenance of the poor clergy (see First Prizes), by virtue of the several acts of parliament made for that purpose, are empowered to augment all livings not exceeding 50l. per annum; and the number of livings following were certified to be capabile of augmentation.

1071 Livings not exceeding 10l. per annum, which may be augmented (with the bounty alone) fix times each, pursuant to the present rules of the governors, which will make 6426 augment.

1447 Livings above 10l. and not exceeding 20l. per annum, may be augmented four times each, which will make 5868 augmentations.

1126 Livings above 20l. and not exceeding 30l. per annum, may be augmented three times each, which will make 3378 augmentations.

1049 Livings above 30l. and not exceeding 40l. per annum, may be augmented twice each, which will make 2098 augmentations.

884 Livings above 40l. and not exceeding 50l. per annum, may be each one augmented, which will make 884 augmentations.

5597 Total number of augmentations, which must be made (by the bounty alone) before the livings are already certified will exceed 50l. per annum.

Computing the clear amount of the bounty to make 55 augmentations yearly, it will be 329 years, from the year 1714, (which was the first year in which any livings were augmented), before all the small livings above certified can exceed 50l. per annum; and if it be computed, that one half of such augmentations may be made in conjunction with other benefactors (which is very improbable), it will require 226 years before all the livings above certified will exceed 50l. per annum.

Dr. Warner, in the appendix to his "Ecclesiastical His-
tory,"
tory," published in 1757, observes, that it will be 500 years before every living can be rated to 601 a year by queen Anne's bounty, supposing the same money to be distributed as there has been for some years past. In the course of between eighty and ninety years, many livings have been augmented by this bounty; nevertheless, the bounty, aided by private benefactions, has been found inadequate to the end of making a reasonable and competent provision for the prochial clergy in a short time. In order to accelerate the beneficial effect of this bounty, it was proposed by the learned Dr. Watton, the present Bishop of London, in a "Letter to his Grace the archbishop of Canterbury," printed in 1783, that a bill should be introduced into parliament, for appropriating, as they become vacant, one-third, or some other definite part, of the income of every deanery, prebend, or canony, of the churches of Wellsminster, Wind- lor, Christchurch, Canterbury, Worceler, Durham, Nor- wich, Ely, Peterborough, Carlisle, &c. to the same pur- pose. But the main part of the first-fruits and tenth were appropriated by the act, passed in the fifth of queen Anne. This plan, it is conjectured, would produce a wonderful change for the better, in 80 or 100 years, in the condition of the inferior clergy, and it would immediately begin to operate for their benefit. "If the reduction of debts and chapters," says this excellent writer, "should be looked upon as a step towards their annihilation, and should, on that account, be diffused by those who think them of use in our ecclesiastical establishment; there is another method in which the poor clergy might be, in no great length of time, well provided for. The clergy at present pay into the exchequer about 14,000l. a year for first-fruits and tenths, according to a valuation of the church revenues, which was made above 250 years ago; the clear revenue, arising to the governors of queen Anne's bounty from this source, may be estimated at about 12,000l. a year. If the clergy were to pay first-fruits and tenths according to a new valuation of their benefices, and the fund thence arising was applied to the augmentation of small livings, every one must feel how greatly the operation of what is called queen Anne's bounty would be accelerated. See Church of England, Clergy, Curate, Ecclesiastical Revenue and vicar.

Augmentation is also used for the augment; i.e. for the addition, or the thing added. Thus it is said, such a minister petitioned the king for an augmentation of salary, wage, &c.

Augmentation, Court of. See Court, &c.

Augmentation, in Heraldry, denotes additional charges to a coat armour frequently given as particular marks of honour, and generally borne, either on an escutcheon, or a canton.—Such are the arms of Ulster, borne by all the Lords of England.

Augus, in Geography, a mountain of Italy, being part of the Apennines, on the confines of Liguria and Piamont.

Augoas, a small island of Africa, on the coast of Mozambique.

Augre, or Awre, a carpenter's or joiner's instrument, used to bore large round holes.

The augre consists of a wooden handle, and an iron blade, terminated at bottom with a wheel bit.

Augsburg, of Augsburg, i.e. Augusburg, an anciently called Augusburg Fast-stadium, in Geography, an imperial city of Germany, and the capital of Swabia. It is situated in a delightful and fertile country, between the rivers Lech and Wertach, near their conjunction. It is not only one of the most ancient, but one of the largest cities in Germany. According to Riebeck (Tour through Germany, p. 111.) its circumference is 94 miles, and it contains about 30,000 people; others say that the number of inhabitants amounts to 35,000, and some reckon them at 40,000. It is enriched with ramparts, walls, and deep ditches; and besides four large and six small gates, which open and shut without any visible interference, it has a secret wicket, of curious contruction for admitting both horses and foot in the night, or in time of war. The town is supplied with water from the river Lech, by means of aqueducts, and of engines and towers, which furnish a sufficient quantity for working several mills of different sorts, for cleaning the streets, and for the domestic uses of the inhabitants. Some of its streets are deep and incommodeous; but others are broad and well paved. This city, since the earliest periods, had small subterraneous passages under the streets, like our cellars, and the Roman channels, for conveying away filth; and the whole town was paved soon after the year 1415, when a rich merchant suggested the utility of it by casting a footpath to be made before his own house. Many of the houses are built of wood, and others of stone, and they serve as specimens of the architecture that prevailed at the period of their construction; and, compared with other houses built in German towns, they exhibit the superior improvement and magnificence to which Augsburg had arrived. The more modern part of this town may be reckoned handsome; many of its churches are finely edifices, and adorned with curious workmanship and paintings. The town-house, completed after six years' labour, in 1620, is a magnificent edifice, and reckoned little inferior to that of Amsterdam. It is a large square building of stone, with a marble portico, at the top of the front within the pediment, is a large spread eagle, holding in its talons a sceptre and globe of gilt braes; the great portal is formed of a beautiful reddish marble, over which is a balcony of the same colour, supported by two pillars of white marble; over the gate are two large griffins of brass; and most of the rooms are wainscoted, and celled with very fine timber. The facade is 110 feet long, 54 broad, and 52 high; its roof is supported by eight columns of red marble; the ceiling is constructed of polished slabs, and divided into compartments, enriched with gilded sculptures; it is filled with pictures and other ornaments; and supported by eight pillars with bases and chapiteurs of braes. In the square, near the town-house, is the fountain of Augustus, or a large marble basin, surrounded with iron ballustrades, with four braes statues as large as life at the four corners; in the middle is a pedastal, having on its top the statue of Augustus, and at the foot are four large sphinxes discharging water from their breasts, with four infants above them, holding in their arms four dolphins which pour water out of their mouths, and over these infants are fountains and pine-apples of brass. Near this basin is a fountain, called that of Hercules, of a hexagonal form, with several braes figures, and particularly Hercules engaging the Hydra. Besides the cathedral, which is a large, gloomy, gothic building, with two spire Reeples, adorned with paintings, and opening with a brass gate, with its fourteen chapes; there are five Roman catholic parochial churches, a splendid college belonging to the Jesuits, five monasteries, three nunneries, and five Lutheran parish churches; and also the Lutheran court, which contains a good library. The Benedictine abbey is a large Gothic building, the ceiling of which is said to be the highest in Germany; it is adorned with several statues and a grand altar. The church of St. Croix surpasst all the others in its architecture, sculpture, gilding, and fine spire. The Imperial Franciscan academy for arts and sciences, was instituted here in 1757. It is under the protection of the magistrates, and its principal aim is to produce good mechanics, and to preserve the manufactures of the city. The part of the city that was erected in 1519, by the noble family of the Fuggers, who are lords of the adjacent country, and in some measure endow-
ed by them, conquests of 106 houses, inhabited by the poor burghers at a low rent; and some of whom are maintained by an annual pension. The burghers of this city are computed at 6000. The inhabitants are partly Lutherans, and partly Catholics. The Jews are excluded from the town; but they occupy a village at the distance of about a league, and pay a tax for the liberty of trading in the day. The aspect of the inhabitants is very different; that of the Protestants resembling the Swabians; and the Catholics being like the Bavarians. The government is aristocratical; it is voted with 45 persons, of whom 31 are patricians, 4 such as have married the daughters of patricians, 5 merchants, and 5 of the commonality; the council is formed of an equal number of Lutherans and Roman Catholics. The police is good; and though the town has no territory, it has no debts. In former times, Augsburg was the great mart for Indian commodities in the interior parts of that extensive country; its trade was very considerable; and we meet with many examples of such large fortunes accumulated by mercantile industry, as raised the proprietors of them to high rank and consideration in the empire. It was celebrated for its curious arts, whole manufactures, particularly in tin and silver, were much admired. Augsburg, however, is no longer what it was in this respect. It has no longer a Fugger and a Weller in it, to lead the emperors millions. Here are no merchants who have capitals of more than 20,000/. others, with small capitals, do the business of brokers and commission- ers; and next to these are the engravers, flatcutters, and painters. Their productions, like the toys of Nuremberg, have a general circulation. Augsburg supplies all Germany with little pictures for prayer-books: and in various ways, its trade is still considerable, though far from being so great as it formerly was. The bishop takes his name from this town, though he resides at Dillingen. His income is about 20,000/. per annum. He is a prince of the empire; and he fits and votes in the college of princes, betwixt the bishops of Constance and Hildesheim; the territory belonging to the bishopric lies between the rivers Lech, Iler, and Danube.

In the diet of the empire, Augsburg was originally called Vindelicia, and was the capital of the Vindelici; afterwards it had the name of Augella Vindelicorum, and Rhetorum, when it came under the dominion of the Romans, and a colony was settled in it by Drusus. Tacitus ( Germ. c. 28.) calls it the moll splied city of Rhetia. From the Romans it was colonized by Bavarians, Alemanni, the Goths, and the Franks; under the last of whom it declined much; but it recovered again under Charles the Fat. The emperor Henry III. took it under his protection, but it suffered much by its contests with the bishops, and its condition became very precarious. From Frederic I. it obtained several privileges; and in 1275, king Rudolph I. confirmed and enlarged its imperial rights.

Augsburg has acquired celebrity, not merely on account of its antiquity and pre-eminence for a long series of ages, and for the extent of its commerce in the 14th and 15th centuries, but from its having been the scene of several considerable transactions. In this place, a council held in 1522, confirmed the edict for the celibacy of priests. In 1518, a diet was held at this place, for concerting and promoting a general crusade against the Turks. At a diet, attended by the emperor Charles V. in 1530, the creed of the Protestants called the Augsburg or Augsburg confession, was presented and publicly read. In 1541, the emperor held a diet in this place for finally closing the controversies with regard to religion, which had long disturbed the empire; and having, at the head of his Spanish troops, taken possession of the cathedral and one of the principal churches, he re-established with great pomp the rites of the Roman worship. Before this diet, he laid forth, known afterwards by the name of the Interim; and in 1548, he made his first attack upon this city, on account of the part it took in its opposition to this synod, infusing a decrees, after he had taken forcible possession of the town, by which he abolished its form of government, dissolved all its corporations and fraternities of its burghers, and nominated a small number of persons, in whom he vested the future right of administration, and each of whom was constrained to take an oath for observing the Interim. In 1550, a diet was summoned by the emperor at this place for further enforcing the observance of the Interim. The diet held here in 1557, settled the religious peace of Germany, by an act called the Reformat. In this city an alliance called the league or treaty of Augsburg, was concluded in 1686, between the emperor, the king of Spain, the republic of Holland, the elector Palatine, Bavaria, and the duke of Savoy; the professed object of which was to restrain the ambition of the French monarch; but the real motive, says M. Arquie in his "Mots des Guerres et des Traites de Paix de la France, &c. 1708," which led William prince of Orange to effect this league, was, to keep Louis busy on the continent, while he, whose fagacity foretold what the intestine folly of James II. of England would lead, might with more ease afford the English throne in his stead. The holibites consequent on this league commenced in 1688, which was followed by a continental war, terminated by the peace of Ryswick in 1697. Although the Protestants were very powerful at Augsburg, they were driven from hence by the Bavarians, and restored again by Guibalas Adolphus in 1632; since which time they have continued, and shared the government with the Catholics. In 1703, the elector of Bavaria besieged the city and took it, and demolished its fortifications; but the battle of Hockfeld restored its liberty, which it enjoys under its own magistrates; the bishop having no temporal dominion in the city. The chapter is composed of persons who can produce proofs of their nobility. The canons have a right of electing their bishop, who is a sovereign, like several of the other German bishops. Augsburg is situated in N. lat. 48° 24'. E. long. 10° 58'.

**Augsburg Confeffion. See Augustan.**

**AUGST.** A village of Switzerland, near the Rhine, formerly a celebrated city called Augula Rauracorum, whither Manius Titius conducted a Roman colony under the empire of Augustus, B.C. 14. It was situated on the river Erga, two leagues from Bale. It was burned by Attila. Of its ancient magnificence many monuments have been discovered; such as the ruins of an amphitheatre, of towers, of subterranean vaults, and also medals, and fragments of statues and inscriptions.

**AUGUR, in Antiquity, a minister of religion among the Romans, appointed to take auguries or oracles concerning futurity from birds, beasts, and the appearances of the heavens.** The word is by some derived from avis, bird, and garvisus, stitching; whence the original office of the augurs is supposed to have been to observe, and take indications from the noise, calling, linging, chirping, and chattering of birds. Agreeably to which, augur is commonly distinguished from aurox, as the latter was supposed employed in observing the flight of birds.—Pezron derives it from the Celtic au, liver, and gar, man; so that, according to him, an augur was properly a person who inspected the entrails, and divined by means of observing the observation of the intestines.

The augurs constituted a college or community, which at first consisted of three persons, one being appointed by Romulus for each tribe; then of four, when Servius Tullius increased the tribes to ten at number; then of nine, four
of them patricians, and five plebeians, added in the year of Rome 454, at the solicitation of the tribunes, and elected from among the common people; lastly, Sulla, in the year 672, increased the number to fifteen. They were at first chosen, like the other priests, by the comitia curiata, but their election afterwards underwent the same changes with that of the pontiffs.

The elder of these presided over the reft, and was honoured with the title of "Magister Collegii." Their office, which terminated only with their death, and of which to crimine or forfeiture could deprive them, as it is compelled in the august law mentioned by Cicero (De Divin. i. ii.), was to interpret dreams, oracles, prodigies, &c. They were to decide what action should be fortunate or prejudicial to particular persons, or to the whole state. Thus they were the interpreters of the will of the gods with respect to the making of war or peace; and all were obliged to obey them in an important article.

They bore an august staff, or wand, called liurus, as the ensign of their office and authority. The other badges of their office were a kind of robe called trabea, and a cap of a conical shape like that of the pontiffs. No affair of moment could be referred to, without first consulting them; and their advice, be it what it would, was, by a decree of the senate, appointed to be exactly and religiously observed.

The office was important and honourable. It was aspired after by some of the principal persons of the Roman state. Cato was a member of the college of augurs; and Cicero also was dignified with this title, and perfectly understood the whole art practiced by himself and his colleagues. Although he ridicules the profession (De Divin. i. ii.), and demonstrates by various proofs the impiety, imbecility, and absolute impossibility of the art, and relates a laying of Cato concerning it, "that he could not imagine how one archivus could look another in the face without laughing;" yet, notwithstanding his contempt of its superfluities, he blamed those generals and magistrates, who on important occasions had neglected them; and maintains, that this practice, though allowed to be subject to many abuses and frauds, ought to be regarded on account of religion and the prejudices of the people. Pliny was also raised by Trajan to the dignity of augur; and through every period of the Roman state, this office was the highest rank in the priesthood to which any senator could be raised. Of this Augustus was so well apprized, that by seizing the office of high priest on the death of Lepidus in the year of Rome 737, B.C. 29, he, and his successors in the empire, obtained a control over all religious matters; and by thus placing themselves at the head of all the colleges of priests, augurs, and keepers of the Sibylline books and others, they became the sole arbitrators in all sacred as well as profane concerns. For an abstract of the history and office of augurs, see AUGUR.

AUGUR, in Entomology, a species of Cimex, of a rufous colour, with the antennae, under-wings, and legs black. A native of the East Indies, and the cape of Good Hope.

AUGUR, a species of Phalana (Notula), with brown wings, characterized with black. Inhabits Germany. Fabricius.

AUGUR, a species of Musca that inhabits New Holland. It is eireoee; abdomen bluish; hides terebraceous and diaphanous. Fabricius, &c.

AUGULAR, something relating to the AUGURS.

The augural instruments are represented on several ancient medals. Evelyn on Medals, chap. ii.

AUGURAL SOPH., CONAUGURAL, that given by a priest on his first admission into the order, called also by Varro adiutal. De Re Rustica, lib. iii. cap. 6.

AUGURAL BOOKS, LIBRA AUGURALUM, those wherein the discipline and rules of augury were laid down. Cic. de Divin. lib. i. cap. 33. Pius (l. 708.) says, that Julius Cæsar composed of augural books.

AUGURAL, in Biography, a learned Italian, was born at Rimini about 1441, studied at Padua, and became professor of polite literature at Treviso, where he had a canonry, and where he died in 1524. He was addicted to the study of alchemy; and is said that pope Leo X. in return for the dedication of his Latin poem, intitled "Chrysopeia," gave him a large empty purse, saying, that he knew how to fill it. From his poem, however, it appears that Augurello was no believer in the art. He published, besides the Chrysopeia, many Latin poems, odes, elegies, and cartes: some of which poehts elegance and purity. The poems in his own language were not published till 1765. Trinolus. Gen. Biog.

AUGURY, the discipline of the augurs, or the practice of consulting the Gods, and learning their will, by divers kinds of omens.

The observation of auguries is very ancient, as having been prohibited by Moses in Levitices.—The cup put in Benjamin's lack, in Egypt, is said to have been that used by Joseph for making auguries.

However this be, augury was undoubtedly a very ancient superstitition. Heidt informs us, that the operations of agriculture were regulated by the migration of birds; and it had probably been in use long before his time, for tracing the changes of the elements. At length the flight of birds was more particularly observed; and their different motions were thought to be of such consequence, that no concern of importance, either private or public, was undertaken without consulting them. Ambard, as this superstition may now appear, and as it certainly was in the extensive application and use of it, it seems to have derived its origin from nature. The appearance and disappearance of particular birds at different seasons, would probably suggest to those who were ignorant of the places to which they migrated, and from which they occasionally returned, that they might visit the other regions, and so come over the gods, and acquire an instinct or faculty for foreseeing future events. A superstitious people might argue in this manner; and as birds are fond capable of imitating the human voice, some impostor might have availed himself of this circumstance, and deduced premonitions in favour of the fallacious system of augury. An ingenious writer luggs (see Stillingfleet's Catechism of Flora), that this might have been the case; and it is alleged, that the institution of augury seems to have been more ancient than that of alchemy; for Homer supplies us with several instances of the former, but none of the latter. Upon the whole, it is not improbable that natural augury gave rise to religious augury; and this again, by a tradition not unnatural, to augury. A passage in Aristophanes furnishes a hint that led to these observations. In his comedy of the birds, he represents one of them as saying, "The greatest blessing which can happen to you, mortals, are derived from us; first, we shew you the feasons, spring, autumn, and winter; the crane points out the time for fowling, when the flies with her warning notes into Egypt; the birds the falor hang up his rudder and take his sail, and every prudent man provide himself with winter garments; the kite appears next, announcing another
another season, when it is time to shear the sheep; after that, the swallow informs you when it is time to put on summer clothes; we are to you, adds the Chorus, Amon, Dodona, Apollo; for after consulting us, you undertake every thing; merchandize, purchases, marriages, &c.

"Exspectam diem Lumen, docebo eam, profetabo."[25]

Now, it seems not improbable, that the same transition was made in the speculations of men which appear in the words of the poet; and that they were easily induced to think that the surprising foresight of birds as to the time of migration, indicated something of a divine nature in them; against which opinion, Virgil, as an Epicurean, protestis, when he says,

"Haud equidem credo, quia fac divinitas illa ingeni."[26]

From these speculations of a conjunctural kind we proceed to observe, that some have ascribed the invention of this art to Prometheus, or Melampus, the sons of Amarynth and Dorippe. Pliny (L. vii. c. 53.), says, that the Carthaginians were the first observers of birds, and that Orpheeus first directed his attention to other animals. Paufanias (Phocis.) attributes the first observation of the flight of birds to Parâlaus, who gave his name to mount Parâlaus. Clement of Alexandrea reports, that the Phrygians were the inventors of this art. Upon the whole, it seems probable, that this species of divination was transmitted from the Chaldaean, Assiatic, and perhaps the Egyptians, to the Greeks; from them to the Hetrurians; and from the Hetrurians to the Latins and Romans.

We find five sorts of auguries mentioned by the ancients. 1. From the appearances in the heavens, as thunder, lightning, and other meteors. 2. From the birds, whence they derived the name of Auspices. Some birds furnished them with observations from their chattering or singing, and others from their flying. The former were called Oicles, and the latter Prophetae. For the taking of both these sorts of auguries, the augur went up to some high place, took the augural staff, heut, at one end like a crook, and marked out with it the four temples or quarters of the heavens. Then he turned to the east, and in that situation, waited for the omen; which was of no signification, unless it was confirmed by another of the same sort. In this manner Romulus perceived Jupiter's approbation of his election to the crown: having seen lightning that came out on his left side and proceeded to his right. This ceremony, which was also observed when Numa was called to the crown, is largely described by Livy, i. i. c. 18. 3. From birds kept in a coop for that purpose. The manner of divining from them was as follows: early in the morning the augur that was to take the observation, after having commanded a general silence, ordered the coop to be opened, and then threw in a handful of crumbs or corn. If the chickens did not eat greedily, scattered the food about with their wings, let fall a great deal of it from their mouths to the ground, or, above all, refused to eat, the omen was reckoned unlucky, and some great mischief foretold; but if the fed greedily, and let none of the food drop out of their mouths, they obtained all desirable assurance of happiness and success. This form of augury was called tripudium, from the ancient Latin word panicum, to strike, and terra, the earth; because the birds, in eating greedily, struck the ground with their beaks. The story of P. Claudius the consul is well known (Val. Max. i. 1. c. 4.), who, ready to engage at sea in the first Punic war, and hearing that the chickens would not come out of their coop, ordered them to be thrown into the sea, with this jest, "If they will not eat, let them drink." But he was vanquished; not, it will be thought, by the contempt of this silly and childish ceremony, but in consequence of his own rashness. 4. The next sort of augury was from heads, viz. wolves, goats, foxes, beavers, asp, lamps, hares, weasels, and mice. The general observations about them were, whether they appeared in a strange place, or crooked the way; whether they ran to the right or left, &c. 5. The last sort of divination by auguries was from what they called dire, or unusual accidents happening to any person, as tumbling, seeing apparitions, hearing strange voices, persons spilling salt on the table, meeting a wolf, fox, a hare, &c. Many curious circumstances of Roman super-\(\text{f}i\)tion with respect to omens and other things are enumerated by Pliny, xxvii. 2.; and among the Greeks, by Paulus, iv. 13. Cæsar, in landing at Adramuetum in Africa, with his army, happened to fall on his face, which was reckoned a bad omen; but he, with great presence of mind, turned it to his own advantage; for taking hold of the ground with his right hand, and killing it, as if he had taken on purpose, he exclaimed, "Pesse te, Africa!" "I take possession of thee, O Africa." Dio, xiii. 199. Saturn. July 59.

Augury, in its more general signification, comprises all the different kinds of divination; which Varro distinguishes into four species of augury, according to the four elements.—Pyromancy, or augury by fire; aeromancy, or augury by the air; hydromancy, or augury by the water; and geomancy, or augury by the earth.

The particular branches are elektoromancy, anthropomancy, locomancy, etymomancy, capromancy, garromancy, geomancy, archipinica, libanomancy, lecanomancy, necromancy, &c. See each described under its proper article.

AUGUST, Augustus, in a general sense, something majestic, venerable, or sacred.

The title Augustus was first given by the Roman senate to Octavius, Jan. 14th. A. U. C. 727. B. C. 27, after his being confirmed by them in the sovereign power.—It was conceived as expressing something divine, or elevated above the pitch of mankind, being derived from the verb augere, to increase, to augment, to ennoble; by which word, Jupiter augsua, "tangam supra humnum fortunam et anxum." When some of the senators, in concurrence with his own heart inclina, would have given him the name of Romulus, as a second founder of Rome; Munatus Plancus proposed his being denominated Augustus, because it denoted a person or thing consecrated by some augur, or form of religion, and nearly allied to the deity. Accordingly, Ovid gives us this reason for the appellation in his "Fasti," i. i. v. 609.

"Sanata vocant Augusta patres: Augusta vocaturo Temple, Sacerdotum rite diecata manus.
Hujus et augurium dependet origine verbi,
Et quandoque suus Jupiter augur opes."

The successor of Octavius affirmed the same quality; so that thenceforward Emperor and Augustus became synonymous terms.

The Greeks rendered the name Augustus by ΕΥΒΑΛΤΟΣ, and gave it to all the successors of Augustus, after the example of the Romans.

Augustus, the title expressive of the character of peace and felicity, which Octavius uniformly affected, was a personal, and Cæsar a family distinction. The former, therefore, should naturally have expired with the prince on whom it was bestowed; and however the latter was diffused by adoption and female alliances. Nero was the last prince who could allege any hereditary claim to the honours of the Julian line. But, at the time of his death, the practice of a century had inseparably connected those apppellations with the imperial dignity, and they have been preferred by a long succession of emperors, Romans, Greeks, Franks, and Germans, from the fall of the republic to the present time. A distinction was, however, soon introduced. The sacred title of Augustus was reserved for the monarch, whilst the name of Cæsar was more freely communicated.
AUG

1693, September it signify this the common: a the town adorned a town division—

On medals and coins, some of the ancient kings of France are found with the appellation Augustus particularly Chloe, Clothaire, and Clovis; add, that the wife of this last, Chrotechilda, is also called by Herring, in his book of the miracles of St. Germain, indifferent other Augustus, or queen.

August, in respect of Chronology, denotes the eighth month of the Julian year.

This was called in the ancient Roman calendar, sextilis, as being the sixth from March, from which the Romans began their computation. The emperor Augustus changed the name, and gave it his own; not that it was the month in which he was born, which was September, and which was first proposed for bearing his name, but because it had been fortunate to him by several victories which he had gained in it.

He preferred this month to September for the reason mentioned in the deliberations of the senate, preferred by Macrobius. The tenor of the is as follows: “As it was in the month, hitherto called sextilis, that the emperor Cesar Augustus took possession of his first consulsip; that he celebrated three triumphs; that he received the oath of allegiance of the legions that occupied the Janiculum; that he reduced Egypt under the power of the Roman people; that he put an end to all civil wars; it appears that this month is and has been a most happy month to this empire; the senate therefore ordains, that this month shall henceforth be called Augustus.” This decree of the senate was ratified by an order of the people.

Our Saxon ancestors called it Wood-monath, that is summer-monath, on account of the plenty of weeds in this season. Spelman.

This month is esteemed one of the richest in the whole year, because of the harvest of the several sorts of grain which is produced in that season. Hence is to be derived the French proverb, a mon has made his August; which proverb is much used among merchants, to signify that a man has been successful in trade, and got an estate.

August is also used in Middle Age Writers, for a power or licence of going out of a city in harvest time, to reap, &c. Du-Cange.

Augusta, in Ancient Geography, a name given singly, or in connection with some epithets, to several towns in honour of Augustus the Roman emperor. Thus, Augustus was a town of Gallia Narbonensis, founded by Augustus, with the title of a colony; situate 15 league from the Rhone, and having a temple of Jupiter, a circus, and an amphitheatre. Also, a town of Cilicia, seated on mount Taurus, five or six leagues north from Adana. Pliny, l. v. c. 27. It became subject to Rome in the reign of Augustus. Also, a town of Dacia. Ripensis. Also, a town of Rhein. Also, a port of Sicily, nearly north of Syracuse. Augusta Aterius, Alera, an ancient town of Spain, in Asturia. Alia Augusturum, a town of Aquitania, originally called Climum, which name it afterwards assumed. In the middle age it took the name of the people Aterius, and is now Aum — A. Batenerum, or Bacianorum, an ancient town of Italy, in Liguria; called also A. Varissinum. A. Brascanum, Braga, an ancient town of Hispania Citerior. P. N. A. Emerita, a town of Lusitania, on the river Aras, the capital of the province: it was a colony of the Emeriti, or of such soldiers as had served out their legal time, were men of experience, or had received marks of favour, founded by Augustus; adorned by him with stately buildings, a long and magnificent bridge over the Gaudiana, and two aqueducts. It is now called Merida. A. Ephesus, a town of Achaia, in Comagene, on the banks of the Euphrates. A. Gennes, a town of Beccia, in Spain, in the country of the Turduli. A. Magna, a town of Achaia, situated at the confines of the Aplar and Phasis. Potentia. A. Scipionum, a division of Egypt, which commenced about the time of Thucydides, comprehending that part of Lower Egypt, which extends from the right arm of the Nile to the coast of Syria, in the frontier of Arabia. A. Nicaea, a town of Hispalia Tarraconensis, on the river Era, in the country of the Aracvac; called by Pliny Porta Ager. A. Procurum, a town of Gallia Cisalpina, at the foot of the Alps, in Duria, so called because Augustus fent thither a colony of the prætorian soldiers: inhabited by the Salassi; now Augusta. A. Ravennorum, a town of Helvetia, now called August. A. Succesum, a town of Gallia Belgica, on the Axone, now Soissonis. A. Taurinorum, a town of the Taurini, at the foot of the Alps, where the Duria Minor falls into the Po, so called because Augustus establisht here a Roman colony; now Turin. A. Tiberii, a town upon the Danube, on the confines of Rhedia and Doria; now Ratibon. A. Trebi, a town of the Aequi, near the springs of the river Ado in Italy, now Trevi, in Umbria. A. Treverorum, a town of Gallia Belgica, belonging to the Trevisi, a people inhabiting the territory between the Rhine and the Molile, now Trevies or Treiers. A. Trinobatum, a town of the Trinobatii, in the isle of Albion, called Augusta from its grandeur; now London. A. Va- gianorum, the seat of a Roman colony, among the mountains, now Wico near Mondonio. A. Vercambrium, a town of Gallia Belgica, now St. Quintin. A. Valeria, a town of Hispalia Tarraconensis, belonging to the Celtibrians. P. Toletum. A. Vindelicorum, a town of Vindelicia, now Augsburg.

Augusta, in Geography, a town of Sicily, eighteen miles by land, and nine by sea, distant from Syracuse, was built by the emperor Frederick II., near the ruins of the Greek city of Megara; and covered a small low peninsula, joined to Sicily on the north side by a long cadiway, having on each side extensive salt-ponds. This projection forms a very fine harbour, the largest and most eay of access in Sicily, opening to the southern exposure, but sheltered by the points of the coast from both wind and wave, with nine fathoms of water in almost every part. A ruinous citadel guards the land gate; and three forts, built on little islands, defend the entrance of the port. The country along the opposite shore is beautifully diversified in its culture. The order of Malta has embellished Augusta magazines of salt meat, biscuit, and flour, for the supply of their ships that are continually passing between the islands. The town is fearfully recovered from the devastation caused by the earthquake in 1693, which destroyed by the falls of the houses about one third of the inhabitants, set fire to the powder magazine in the citadel, which blew up, and threw the light-house precipitately into the sea. Since that time the town has been rebuilt on a regular plan, with low houses to prevent injury from another shock if it should occur. The number of inhabitants
habitants is reckoned at 9205 by an enumeration. Swinburne says its population amounts to 16,000 persons. Travels, vol. 4. p. 116.

Augusta, a county of Virginia, in North America, lying partly on the east and partly on the west of the North Mountain, a ridge of the Alleghany. The soil is fertile, and the country contains 16,886 inhabitants, including 1567 slaves. In this district there is a remarkable cascade, called “the falling spring,” which is a branch of the James, where it is called Jack’s river, rising in the mountains twenty miles south-west from the “warm or hot spring,” in N. lat. 35° 9’. W. long. 8° 6′. At the “falling spring” the water falls two hundred feet, being fifty feet higher than the fall of Niagara: and the sheet of water is only twelve or fifteen feet wide above, and somewhat wider below.

Augusta, a town of North America, in the upper district of Georgia, situated on a fine plain in Richmond county, on the south-west bank of the Savannah river, where it is near five hundred yards broad, at the bend of the river, 127 miles north-west from Savannah, and 934 south-west from Philadelphia. At the first settlement of the colony, general Oglethorpe erected a fort here for protecting the Indian trade, and holding treaties with the natives. In 1787, it contained 200 houses. The country round it has an excellent soil, which, together with its central situation between the upper and lower counties, induces its improvement. N. lat. 33° 19′. W. long. 80° 46′.

Augusta, a town of Upper Canada.

Augusta, a river in the south-east part of the island of Cuba, in the Well 1 degrees, navigable for several leagues from the mouth, in which is Cumberland harbour.

Augusta, Histria, is the history of the Roman emperors from the time of Adrian to Carinus, composed by six Latin writers, El. Spartianus, Julius Capitolinus, El. Lampridius, Vukatus, Gallicanus, Trebellen Pollio, and Flavius Vopiscus. They all lived in the reign of Diocletian, though some of them flourished under his successors, near the end of the third and beginning of the fourth century. They are rather biographers than historians, and take more care to inform us of the good and bad qualities of the emperors, of their birth, education, stature, men, and even their diet, and the clothes they wear, than to describe their wars, the laws they enacted, and the great revolutions that happened during their respective reigns. Vopiscus, who was a Syracusan, and who is said, in the life of Probus, to have imitated Suetonius, according to the general opinion of the learned, far excels the rest, both as to his method and style; nevertheless he has many imperfections, and is not to be compared with any of the Latin historians. The other five betray great want of judgment in their choice, and of method in digressing their materials. Of these fix writers, Capitolinus is the most confused and injudicious; whence some have suspected that the author of this collection had blended together the relations of Capitolinus, Spartian, and some others. Their style is vulgar and unpolished, their expressions uncout, and sometimes hardly intelligible. Vopiscus observes, that Lampridius and Capitolinus attended more to truth than to elegance in their narrations. Pollio acknowledges that his style has nothing of the dignity of the ancients. Fabr. Bibl. Lat. vol. ii. p. 37, &c. Anc. U. Hist. vol. iv. p. 67. The histories of these writers were published together, with the notes of Calafonon, Salmasius, and Gruter, in two vols. 8vo. 1571; and re-published by I. P. Schmidt, in 1771.

Augustales, or Societatis Augustales, or Fla- minus Augustales, were the priests of Augustus, appointed after the deification of that emperor by Tiberius and instituted by him, to perform the service of the new god. Three of these were Drusus, Claudius, and Germanicus; and the others, who supplied the number of twenty-one, were chosen by lot among the citizens of the first families in Rome. The same name of Augustales was also applied to other colleges of priests, instituted in honour of the fac- eifiers of Augustus, and who like him were deified. The appellation is also extended to those who conducted the first ranks of the army; to the prefects of Egypt, who were established by Augustus after the defeat of Antony and Cleopatra; to all the officers of the imperial palace; and to those citizens in the colonies and municipia, who held the middle rank between the decurions and the people.

The Augustales of the provinces were probably set apart for the worship of Augustus in the same manner with those of Rome.

Augustalia, in Antiquity, a festival instituted in honour of the emperor Augustus.

This festival was first established in the year of Rome 735, being the fourth after he had ended all his wars, and settled the affairs of Sicily, Greece, Asia, Syria, and the Parthians. The day whereon he made his entry into Rome, being the fourth of the ides of October, was appointed to be kept a feast, and was called Augustalia.

Augustus and was also a name given to the games celebrated in honour of the same prince, on the fourth of the ides of October.

Augustalis, or Praefitus Augustalis, a Roman magistrate who was appointed to govern Egypt, with a power much like that of a procurator in other provinces.

Augustan, relating to Augustus or Augustus.

Augustan Era. See Actian.

Augustan, or Augsburg Confession, and Ecclesiastical History. This work contains twenty-eight chapters, of which the greatest part is employed in rep resenting, with perplicity and truth, the religious opinions of the protestants, and the ref in pointing out the errors and abuses that occasioned their separation from the church of Rome. The style in which it is written is plain, elegant, grave, and perpicious, such as becomes the nature of the subject, and does honour to the eloquent pen of Melancthon. The matter of this confession was invented by Luther, who, during the diet, refided at Coburg, a town in the neighbourhood of Augsburg; and even the form it received from the acute judgment of his colleagues was authorized by his counsel and approbation. The Roman Catholics attempted a refutation of this confession: this refutation was read publicly in the assembly; and the emperor demanded submission on the part of the Protestant members; but the Protestants were not satisfied, and requested a copy of this reply, that they might demonstrate at large its insufficiency and weakness. The emperor refuted this request, interpolated by his authority to suspend any further proceeding, and solemnly prohibited the publication of any new writings or declarations that might contribute to lengthen out these religious debates. Melancthon prepared an answer, which was presented to the emperor, but he refused to receive it. This answer was afterwards enlarged and published in 1531, with the other pieces that related to the doctrine and discipline of the Lutheran church, under the title of “A Defence of the Confession of Augsburg,” or “Apologia Confessionis Augustana.” In composing this defence,
defence, melan-Ghon’s love of peace and concord seems to have carried him beyond what he owed to the truth; and through servile fear, excessive charity, or indecision of mind, he makes several strange concessions to the church of Rome. Moffheim’s Eccl. Hist. vol. iv. p. 283. In some subsequent editions of the “Apologet,” the obnoxious palliages were omitted, and the philology that had given such offence materially altered. See PHILIPPISTS.

AUGUSTATICUM, in Middle Age Writers, denotes a largess, or donation, of an emperor to the people or fociety.

AUGUSTENBERG, in Geography, a town of Germany, in the county of Upper Saxony, and county of Schwartzenberg, three miles east of Arnstadt.

AUGUSTENBERG, a town of Denmark, in the duchy of Sleswick, six miles east of Sonderborg.

AUGUSTEBUM MARJOR, in the Natural History of the Ancients, a name given to the common green and white marble so frequent in life with us for tables, &c.; and called by our ancients, Egyptian marble.

AUGUSTIN, Anthony, in Biography, archbishop of Tarragona, was born at Saragossa, of parents of distinction, and studied in various universities both of Spain and Italy. At the age of twenty-five, he published a treatise of law, intitled, “Emendationes et Opinionis Juris Civilis.” He was sent as nuncio to England by pope Julius III. in 1554; and in 1562, he distinguished himself at the council of Trent. From the year 1574 to 1586, the time of his death, he presided the archbishopric of Tarragona. His liberality to the poor was such, that when he died, there was not found money sufficient to defray the expenses of a funeral fittable to his rank. Of many writings in law, which he left, the most valuable is a treatise “De Emendatione Gratiani,” first printed at Tarragona in 1587, and afterwards published in 1672, by Balzar, 8vo., and esteemed an elaborate treatise on the canon law. He wrote also “Antiquae Collectiones Decretalium,” printed at Paris in 1621, folio, with notes; “Dialogues on Medals,” published at Tarragona, in 1587; and other treatises, chiefly on canon law, with skill in the law, he united purity of language. Nouv. Dict. 8vo.

AUGUSTIN, s.d. by contraction Austin, St. usually styled “the Apostle of the English,” was the first archbishop of Canterbury, and flourished about the close of the sixth century. He was originally a monk in the convent of St. Andrew at Rome, educated under St. Gregory, afterwards pope Gregory I.; and about the year 596, deputed by him on a mission to Britain, for the conversion of the English Saxons. Whilst Augustin, and forty monks, who were his associates in this mission, were pursuing their journey, they were discouraged by an apprehension of the dangers which they were likely to encounter; and Augustin was sent back from France to Rome, with a petition to be recalled from this hazardous undertaking. Gregory, however, was determined not to abandon his project; he therefore encouraged them to proceed, furnished them with recommendatory letters to the king and queen of France, and to the bishop of Arles, and instructed them to take with them some interpreters from the Franks, whose language still resembled that of the Anglo-Saxons. In the year 597, the missionaries landed in the isle of Thanet; and having informed Ethelbert, king of Kent; whose queen Bertha was a Christian, and who was disposed to give them a favourable reception, of their arrival, and of the design of their mission, they were introduced into the royal presence. The king, however, chose to receive them in the open air, from a superstitious notion that he would be thus more secure from the delusive influence of their magical arts, than within the walls of a house. Augustin, by means of his interpreters, opened his commission; and after stating to Ethelbert the leading doctrines of Christiinity, he allured him to embrace the religion of Christ by the assurance of an eternal kingdom in heaven. The king, after a candid hearing, hesitated in abandoning the religion of his ancestors; but with a liberality which reflects honour upon his memory, and under a due sense of the kind intention with which the missionaries had undertaken so long a journey, he allowed them to remain in the country, and to use their efforts for the conversion of his subjects. Accordingly, he aligned for their residence that part of the ancient Durovernum, or the modern Canterbury, which is now called “Stablegate,” and which had been formerly a kind of oratory or chapel for the royal family, where they worsthipped and offered sacrifice to their gods. The missionaries entered the city in procession, singing psalms. Their ministerial labours were at first confined to the precincts of the city, where the accession of new converts was inconsiderable; but as soon as the king himself was professed and baptized, they obtained liberty to extend their mission to every part of his dominions; and their success was so great that Augustin is said to have baptized 10,000 persons of both sexes in one day, in the river Swale, at the mouth of the Medway. In the commencement of his mission, he thought it expedient to refrain from coercive measures; and, as Bede informs us (Eccl. Hist. l. 2. c. 26.), he instructed Ethelbert, that the service of Christ must be voluntary, and that no compulsion ought to be used in propagating the gospel; nor does it appear that any violence was used in the first establishment of Christianity in England, besides that of demolishing idols, and converting Pagan temples into Christian churches.

Augustin, who seems to have been consecrated archbishop of Canterbury before his arrival in England, was actuated by his rapid success with the ambition of palliaging, under the function of the pope, the supreme authority in the English churches. For the purpose of soliciting this honour, or that of primacy of England, and also of obtaining instructions with regard to other subjects, which may now be deemed of very questionable or trivial importance, he deputed messengers to the pope, who speedily returned with a full answer to the archbishop’s inquiries. They also brought with them a pall (See PALL), as a badge of archiepiscopal dignity, and various other ecclesiastical vestments and utensils. The pope also gave Augustin directions for erecting twelve fees within his province, and particularly for appointing one at York, which, if the country should become Christian, he was to form into a province with twelve suffragans. Among the counsels communicated by the pontiff to Augustus on this occasion, was an admonition not to be elated with pride on account of the miracles which he had been enabled to perform in confirmation of his ministry, but to consider that this power was given him, not for his own sake, but for the sake of those whose salvation he was appointed to procure. Augustin, having fixed his fee at Canterbury, dedicated an ancient church, formerly built by some Roman Christians, to the honour of Christ; and king Ethelbert founded the abbey of St. Peter and St. Paul, afterwards called St. Augustin’s, and first converted into the archbishop’s palace. Such was the attachment of St. Augustin to the see of Rome, that he attempted to bring the British bishops in Wales under the authority of the Roman see. From the time when the ancient Britons, or Welsh, were first instructed in the Christian faith by Paganus and Damianus, who had been sent at the request,
request of Lucius, in the second century, as missionaries by
Eleutherius bishop of Rome, the churches had followed the
rules of their first fathers, without regarding the futile
alterations preferred by the church of Rome. But
pope Gregory, by appointing Augustin metropolitan of the
whole island, had claimed jurisdiction over the churches of
Wales; and Augustin was well inclined to support the
claim. Two conferences were held on this subject; both
of which were unsuccessful. At the second conference, fe-
ven British bishops attended, and many monks from the
monastery of Baugor, under the direction of their abbot Dinoch.
Dispossessed as they were to pay all due respect to the archie-
piscopal dignity of Augustin, they took measures, previ-
ously to their meeting, for preventing a termination of their content which would be unfavorable to their interest. Ac-
cordingly they confabulated a hermit of acknowledged under-
standing, and requested his opinion, whether they should
surrender their independence, and their ancient customs and
privileges, to the pretensions of Augustin. The hermit,
probably apprized of the dispositions and character of the
meeting, gave them the following instructions: "If
this man follows the example of his master, who was meek
and lowly of heart, he is a servant of God, and you ought
to obey him; if not, his claim is not to be regarded: let
Augustin and his brethren be first seated in the place of
meeting; if upon your entrance, he rise up to salute you,
honour him as a messenger from God; if he neglect to show
you this civility, reject his offers, for he has not taken upon
him the yoke of Christ." When the British bishops and
monks entered the hall, Augustin, who had taken the chair,
received them sitting. Upon which, conformably to the
advice of the hermit, they declined complying with the
proposals of the haughty prelate, and disclaimed all sub-
jection to the see of Canterbury, and virtually to that of
Augustin. Informed by such conduct, took leave of the
council, and denounced upon the British clergy this
menacing sentence: "If you will not accept of peace with
your brethren, receive war from your enemies; if ye will
not preach the way of life to the English, suffer death from
their hands." "The event corresponded with the menace:
Ethelfrid, king of Northumbland, soon afterwards
marched with a large army to Caerleon, and made a great
slaughter, in which year 1200 of the monks of Baugor
were put to the sword. The memory of Augustin has been
loaded with the infamy of having, to satisfy his revenge,
fulfilled his own prophecy. Bishop Godwin (De Praefil.
Angl. p. 43. ed. 1616.) exclaims, "Excellent prophet!
who could predict what he knew so well how to accom-
plish?" and he affirms, upon the authority of an anonymous
manuscript, and of an old French annalist, that Augustin,
refenting the rejection of his proposal by the Welsh bishops,
imitated Ethelbert to fall upon them, as a wolf upon a
flock of sheep, with a large army, borrowed in part from
Ethelred; and that the bishop himself joined the army of
Ethelred at Chester, and assisted him to gain a complete
victory. In opposition to this testimony, however, it is
urged by the learned Wharton (Angl. Sacr. t. i. p. 80.), on
the credit of an ancient book cited by William Thorpe,
that Augustin and pope Gregory both died in the same
year, that is, in the year 604, when it is certain Gregory
died; whereas the slaughter of the monks happened, ac-
cording to Godwin (ubi supra), in 625. Bede, who men-
tions this battle (l. ii. c. 2.) adds, that it was fought after
the death of Augustin; and though this passage has been
subjected to interpretation, the supposition has been founded
merely on the omission of it in Alfred's Saxon version,
though it is found in all the most ancient manuscripts; and
on Augustin's having signed a charter with Ethelbert, in
603; whereas the custom of signing written instruments is
not older than the year 700. It is not easy to decide
with any degree of certainty, whether Augustin allied in
the war against Wales; but however this be, he cannot
be excused from the charge of having entertained senti-
ments of revenge against the Wulf bishops, and he may
be justly suspected of having at least assisted the holl.
the opposition, and he at least meditated revenge. We can
only judge of the character of this apostle by his actions,

AUGUSTINE, Saint, a celebrated Christian divine of
the catholic church, the son of Patritius, a citizen of
mean rank, and Monica, celebrated for her piety, was born
at Tagaste, a small town of Africa, in the year 354. His
mother, anxious for his imbibing the principles of the Christi-
ian religion, placed him among the catechumens; and dur-
ing a dangerous illness, he expressed a desire of being bap-
tized; but upon his recovery, he postponed the ceremony,
from a superstitious notion that his committed after baptism
were more heinous than those committed before. By his
father he was sent for classical learning, much against his own
inclination, sent to a school in the place of his nativity, and
afterwards to Madaura. But he was idle and dissipated;
and guilty of deceiving his masters, and of pilfering from
his parents. To the study of Greek he was at this time
particularly averse; nor does he seem in mature life to have
made any great proficiency in it, as he confesst that he read
the Platonists in a Latin version. At the age of sixteen,
and in the year 371, he was removed to the schools of
Carthage; but, in the mean while, notwithstanding the coun-
sel and remonstrances of his mother, he acquired habits
of incontinence, which were not soon abandoned, and which
he ingenuously acknowledges and laments, in a book of
"Confessions," written by him at a subflequent period,
when he became sensible of his folly. At Carthage he
devoted himself to the study of rhetoric and polite literature;
and still poftelligence sentiments not wholly depraved, he
found great pleasure in perusing the philosophical writings
of Cicero, particularly his Hortensius, or "An exhortation
to the study of Philosophy," not now extant. Having been
betimes instructed in religion, he occasionally read the scrip-
tures; but not finding in them that kind of eloquence which
he met with in Pagan writers, he disdained their simplici-
ity, and threw them aside. However, during his continuance
at Carthage, he attached himself to the Manichees, and
from the nineteenth to the twenty-eighth or twenty-ninth
year of his age, he was a disciple and advocate of this sect.
When he was about eighteen, his mother, who was then
become a widow, visited him at Carthage, and made every
effort in her power for reclaiming him from debauchery and
heresy; and the persuaded him to return to Tagaste, where
he opened a school of grammar and rhetoric. Notwith-
standing the reputation he acquired, his mother had still
reason to bewail his conduct; and Augustine himself, in his
"Confessions," (l. iii.) expresses, with great tenderness, his
affections of the prayers which the prefented, and the tears
which the shed, on his account. About the close of the year 379,
Augustine removed to Carthage, and taught rhetoric in that
city. He was also at this time a frenious advocate for the
Manichæan system. But his love of pleasure, whatever were
his other engagements, continued to be his predominant
passion; and he formed a connection with a miscreant, by
whom he had a child, and to whom he remained constant.
Regardles of decorum, he named this child "Adoeanus,"
the gift of God; and he speaks of him, at the age of fifteen,
as a young perfon of extraordinary talents. Provoked by
the influence of his scholars at Carthage, Augufinus re-
moved with his miscreant and child to Rome, and taught
grammar and rhetoric in that city; but having reason to be
dissatisfied with his situation, he fought a new settlement
and, by the recommendation of Symmachus, prefec of
Rome, he was appointed, in the year 383, professor of
rhetoric at Milan. Here he had an opportunity of attend-
ing the sermons of Ambrose, bishop of this city, which led
him to waver between Manicheism and the Catholic faith.
In this state of hesitation his mother came to Milan, and
renewed her entreaties that he would forfake the Manichees,
and quit his irregular course of life. The entreaties of his
mother were enforced by the conversation of two worthy
men, Simplician and Patilian; and he was thus prepared for
the change which soon followed, both in his sentiments and
conduct. Whilst he was in a state of deliberation and
fusement, praying to God for illumination, he heard, as he
says, or imagined that he heard, a voice like that of a
singing-boy, addressing him in these words, "Tole, lege;
tolle, lege;" or, "Take, read; take, read;" and opening the
New Testament, he turned to this passage; "Not in rioting
and drunkenmefs, not in chambering and wantonness,
e&c." Accordingly, he immediately relented to become a
member of the Catholic church, and entered himself among
the catechumens; and further to testify the sincerity of his
conversion, he yielded to the perfufion of his mother, and
determined to marry. But before he had an opportunity of
executing this purpose, his character was reproached by an-
other connection of an illicit nature, (Confeff. i. vi. c. 15.)
At the close of the year 387, Augufinus relinquished his
profession, devoted himfelf to the study of theology, and em-
ployed the interval previous to his baptism, in explaining the
scriptures, and vindicating the Catholic faith. In compli-
ance with the advice of father Ambrose, he dedicated him-
felf to the ministry; and having difmiffed his new miscreant,
and abandoned his intended wife, and having received bap-
tism with his illegitimate fon, and his friend Alphius, on
Easter-eve, in the year 387, he consecrated the remainder of
his life to religion. In the year 388, his mother died at
Orfa; and Auguftin returned to Africa. Having spent
three years in his native city, where he exhibited an example
of abstinence and piety, and of diligent application to the
study of the scriptures, he visited Hippo; and by the re-
commodation of Valerius, the bishop, he was elected and
dominated prefbyter in the year 391. Here he founded a re-
ligious society, composed of persons who were required to
throw their property into a common flock, and to devote
themselves to the exercise of piety. In 395, he was ap-
pointed coadjutor, or joint bishop with Valerius, to the
church at Hippo. After his advancement to the epifeopal
office, he distingufified himfelf, on various occasions, by the
ardour of his zeal against heretics of every denomination;
and against the Manichees, Donatifts, and Pelagians, he
waged a perpetual controversy. From the time of his con-
version to that of his death, his manners were, in general,
pure and austere; although from one of his confeffions (l. x.
c. 31.) there is reason to infer, that he was addicted to
hard drinking. His enomials have indeed extolled his
moderation and urbanity; and the following inscription on
his table deferves being recorded:

"Quiquis amat diis abstinent redere vitam,
Hanc menem indignam novetis effe fihi."
"Far from this table be the worthless guest,
Who wounds another's fare, though but in jest."
printed at Paris in 1679, and reprinted at Antwerp in 1700; and fill eleven volumes in folio. This fact is said to have written a treatise on music, in five books, which are printed in the folio edition of his works at Lyon, in 1756. There is a MS. treatise of his writing in the Bodleian library at Oxford, entitled, "De Musica:" but it is merely a homily in praise of sacred music; nor do his six books contain any other rules than those of metre and rhythm. His remains were carried by the Catholic bishops of Africa into Sardinia, the place of their exile; and from thence, after an interval of 200 years, they were conveyed by Luitprand, King of the Lombards, to Paris, his capital.

In estimating the talents and learning, the disposition and character, and the value of the writings of Augustine, some have excited him far above, and others have degraded him as much below his just rank. Mosheim observes, that his fame filled the whole Christian world; and that, if not without reason, as a variety of great and striking qualities were united in the character of that illustrious man. A sublime genius, an uninterrupted and zealous pursuit of truth, an indefatigable application, and more in that pattern, a faith piet, and a faithfulness and liveliness, conforming to establish his name on the most hallowed foundations. It is, however, certain, that the accuracy and solidity of his judgment were by no means proportionable to the eminent talents now mentioned; and that, upon many occasions, he was more guided by the violent impulse of a warm imagination, than by the cool dictates of reason and prudence. Hence that ambiguity which appears in his writings, and which has sometimes rendered the most attentive readers uncertain with respect to his real sentiments; and hence also the just complaints which many have made of the contradictions that are so frequent in his work, and of the levity and precipitation with which he himself to write upon a variety of subjects, before he had examined them with a sufficient degree of attention and diligence. That he possessed a strong, capacious, argumentative mind, is generally allowed; but his style, though sometimes animated by the eloquence of passion, is usually clouded by false and affected rhetoric. "It has (says one of his biographers) more argument than oratory, more fluency than elegance; and so, in learning him to have a certain facility and inveterate involvement of ideas through long periods, which require in the reader acute penetration, close attention, and quick recollection. In fine, he is, as Erafimus has observed, a writer of obscurae subtleties, and unpleasant proportioin."

And, as many of his speculations are in themselves uninteresting, it is no wonder that his voluminous writings are now very much, and perhaps unduly, neglected. At the same time it must be so large that the doctrines of this father in the church, should have led men to adopt a gloomy system of religion, and to support it with all the vigour of persecution. Such particularly are those charged upon him by Le Clerc (Letter prefixed to Supplement to Hammond's Paraphrase), which take away goods and justice both from God and man; the one representing God as confining men to eternal torments, for sin which they could not avoid; the other, flinging up magistrates to persecute those who differ from them; in religion. It has also been regretted, that no writings, those of Aristotle excepted, have contributed more than Augustine's, to encourage the vogue of fabulous imitation, which disfigured the scholastic age. The learning of Augustine, and particularly his knowledge of the Greek language, have been disputed; and hence the importance of his scripture criticisms has been depreciated. But although it be allowed that his commentaries chiefly confine of popular reflections, spiritual and moral, or allegorical and mythical perviews of the literal meaning; yet the works of this father are not wholly deficient of remarks and critical inter-pretations, that are pertinent and judicious. To such, after a detail of extracts from the writings of Augustiue, the impartial and candid Dr. Lardner has referred. With regard to his knowledge of the Greek language, this excellent writer is of opinion, that he understood Greek letter than some have supposed; and he has cited several passages, from which it may be argued, that Augustine frequently compared his copies of the Latin version with those of the Greek original. M. Le Clerc in his book, that Augustine sometimes very happily explain Greek words: but on such occasions he subjected, without sufficient reason, that he had the assistance of another.

As to the character of Augustine, it must be acknowledged that his "Confessions," whatever claim they may have to the praise of ingenuity and honesty, must remain a perpetual memorial of disgrace. Besides, although this father of the church entertained, in the earlier period of his ministry, sentiments of mildness and charity towards heretics, he appears at a later period, and under the influence of passions inflamed by political disputes, the advocate of intolerance and persecution. In a letter to Vincentius (Ep. 93.), a Donatist bishop, written about the year 408, he alights several reasons for the coercive measures of secular authority against schismatics; and urges the good effects which the terror of the imperial laws had produced in the conversion of several whole cities. Having once thought, as he confesses, that no man ought to be forced, he at last yielded to experience. In another letter of the same date, he inures the proconsul of Africa to restrain the Donatists, but not to punish them with death; and yet in this letter, written professedly for urging the magistrate to persecution, Augustine, with an inconstancy, the reproach of which he too often incurs, thus liberally concludes (Ep. 190.): "it is a more troublesome than profitable labour to compel men to forsake a great evil by force, rather than by instruction." Upon this inconstancy Voltaire pleasantly remarks (Treatise on Toleration): "I would say to the bishop of Hippo, as your Reverence has two opinions, you will have the goodness to permit me to abide by the first, since I really think it the best." Although his conduct in procuring the first law to compel Christians to baptize their infants, in a council at Mela in Numidia, in the year 416, is altogether indefensible; and the writer of this article, abhorring every species of religious constraint and persecution, cannot attempt its vindication; yet he cannot adopt the severe statures of the spriagly writer that refers to this fact, in their whole extent and unqualified acrimony. "The name of Augustine (says he) had funk, before this time, below con-temn in every free country. He was an irritable man, often disappointed, and foiled by able opponents; passion for power was his ruling disposition, after his sensual appetites had spent their force in debauchery. Too insignificant to obtain distinction in the state, he reconnoitred the church, and felt himself excellently qualified to cast out of Solomon's song to unsuspecting Christians, especially single filters and monks. A superannuated bishop, to whom he made himself convenient, lifted him into preferment. From that day he became a merciless tyrant, and truckled to the bishop of Rome only for the sake of playing Jupiter in Africa. When he obtained the support of the emperor, and got his dreams tacked to imperial decrees, he became the scourge of all good men within his reach, whose confiscations, banishments, and death, with the ruin of their families, lay at his door. He considered himself as an oracle of God, emperors only as officers whom heaven had appointed to execute his decrees." Robin's History of Baptism, p. 217. Gen. Diet. Mosheim's Eccl. Hist. vol. i. p. 362. Dupin's Eccl. Hist. v. century, vol. ii. p. 125. Lardner's works, vol. x. c. 117. p. 8:123. Gibbon's Hist. vol. vi. p. 22. Gen. Biog.

Augustine, St. in Geography, a town of America.
the capital of East Florida, is situated on the sea-coast, about 80 leagues from the mouth of the gulf of Florida, 180 miles west from St. Mark's, and 316 south-west from Charleston, in South Carolina. Its figure is oblong, and it is intersected by four streets at right angles. It is well fortified, and has a church and monastery of the order of its name. N. lat. 30° W. long. 81° 30′.

Augustine, Cape St., lies on the coast of Brazil, in the Atlantic ocean, 300 miles north-east from the bay of All-Souls. S. lat. 8° 30′ W. long. 55° 40′. Also, a cape of the Minasauras islands in the Eastern ocean. N. lat. 6° 40′ E. long. 126° 20′.

Augustine's, St., a port and river on the coast of Labrador, near the straits of Belle Isle, and opposite to St. John's bay in Newfoundland. In the harbour are two small islands, and about two miles south-west, a chain of little islands, called "St. Augustine's chain." It is about 25 miles from Great Mecatina island. N. lat. 51° 10′ W. long. 58° 50′.

Augustine's, St., a number of small islands on the coast of Labrador, in the gulf of St. Lawrence, near its mouth.

Augustine's, Bay, St., is a commodious bay that lies on the west side of Madagascar island, near the south entrance of the Mozambique channel, between the east coast of Africa and the west coast of the island. It abounds with fish, and furnishes a plentiful supply of beef, mutton, goats, and fowls. S. lat. 23° 55′ 29″ E. long. 43° 8′.

Augustins, or Augustinians, in Ecclesiastical History, an order of religious; thus called from St. Augustin, whose rule they observe. The Augustins, properly also called Augusti Friers, were originally hermits, whom pope Alexander IV. first congregated into one body, under their general Lanfranc, in 1256. Soon after this aititution, this order was brought into England, where they had about 32 houses at the time of their suppression. The Augustins are clothed in black, and make one of the four orders of mendicants. From these arose a reform, under the denomination of Bare-foot Augustins, or Minorites, or Friars Minor.

There are also canons regular of St. Augustin, who are clothed in white, excepting their cope, which is black.

At Paris they are known under the denomination of Religious of Geneva; that abbey being the chief of the order. There are also nuns and canonesses, who observe the rules of St. Augustin.

Augustinians are also those divines who maintain, on the authority of St. Augustin, that grace is effectual from its nature, absolutely and morally, and not relatively and gradually. They are divided into rigid, and relaxed.

Augustobona, or Augustomana, in Ancient Geography, a city of Gaul, belonging to the Senones, called also Civitas Tricassium; now Troyes.

Augustobriga, or Augustobrica, a city of Hifpania Tarragonensis, in the country of the people denominated "Peledones," exit of Numantia, and north-west of Bilbilis.

Augustodunum, a famous city of Gaul, the capital of the Edui; now Autun.

Augustomagus, an ancient town of Belgic Gaul, placed, in the Itinerary of Antonine, between Cesaromagus and Sestum, now Sens. 

Augustonometum, a city of Gaul, the capital of the Averni; now Clermont en Auvergne.

Augustopolis, an episcopal town of Arabia.—Also, a town of Phrygia Salutaris.

Augustoritum, a town of Gallia Aquitanica, and capital of the Lemovices; now Limoges.

Augustow, in Geography, a town of Poland, in the latitude of Bielfk, fifty-six miles N.N.W. of Bielfk.

Augustulus, or Romulus Augustus, in Bi-
Upon his arrival, the Garrison of Brundunum, which was very numerous, and which consisted of veteran soldiers, went out to meet him, and introduced him by a kind of triumph into the city. Octavius thanked them for their assistance and respect; and having offered a solemn sacrifice to the gods, declared himself Caesar's heir, and assumed the titles of Caius Julius Caesar Octavius; avowing himself by the latter of these appellations to be of the Octavian family. Having supplied himself with money, arms, and provisions, he purged his route through Campania, and after paying a visit to Cicerone in the neighbourhood of Cuma, arrived at Rome, where the party of Antony and Lepidus, which, under a pretence of avenging Caesar's death, aimed at establishing its own power, had obtained an universal sway. As Octavius approached the capital, he was met by most of the magistrates, the officers of the army, and the people; but Antony declined shewing any token of respect. As soon as his adoption was publicly ratified in the forum, and duly registered, he waited upon Antony; and requested to have delivered to him, as Caesar's chief heir, the money which he had conveyed from Caesar's house to his own, that he might be enabled to discharge his legacies. Antony's behaviour at this interview, was haughty and imperious; his reply with regard to the money which he demanded, and of which part had been appropriated to the purposes of avarice and ambition, was unsatisfactory; and his address closed with reminding Octavius, in a style of authority and menace, that the favours of the people are, generally speaking, short-lived, and that popular affection is more inconstant than the waves of the ocean. Octavius retired, digusted and offended; and apprised, that the confidant withheld his father's money and estate from him in order to disable him from pursuing the favour of the people, he sold his own patrimony, and the estates of his mother and father-in-law, and with the produce of these sales, he paid part of Caesar's legacies; and by this act of generosity he so charmed the populace, that they unanimously exalted his interest, and broke out into bitter invectives against Antony, for withholding his father's estate. An attempt, however, was made towards reconciling these two contending parties for the public favour; and it was attended with a partial and temporary success. But new occasions of variance occurred; and at length Octavius was charged with a design of affalinating his rival. This furnished Antony with a pretence for drawing into Italy a considerable army. Octavius, alarmed by this hostile preparation, frowarded into Campania, and having collected 100,000 brave veterans who had served under Caesar, marched immediately towards Rome. But as he had no military title, nor any majesty which gave him a right to command the forces of the republic, especially against a confidant, he thought it advisable to halt at the temple of Mars, within two miles of the city, till he obtained the consent of the people for his entry, which was soon granted him. Antony was at this time at Brundunum, and as he was hourly expected with a considerable force, it was fully apprehended that the flames of a civil war would at last kindle within the walls of the city. Parties were formed for one and the other of these formidable rivals; and whilst many of the senators were deliberating which side to take, Cicero, probably, as it has been said, more with a view of procuring for himself a bountiful manner, than for rescuing his country from tyranny, declared for Octavius. At his motion, Antony, who had actually invaded the province of Cisalpine Gaul, and laid siege to Mutina, was declared an enemy to his country. Two new confidants, viz. Pansa and Hirtius, who had both served under Caesar, and who were the intimate friends of Cicero, were ordered to raise troops, and to march to the relief of Decimus Bruto, who was closely besiegued in Mutina. In two battles that were fought by the confidants and Antony in the neighbourhood of this town, both the confidants fell; and Octavius became commander in chief of the whole army. Pansa, when he was dying of the wounds which he had received, earnestly advised Octavius to compromise his difference with Antony, as the only means of saving his life and advancing his fortune; and the confidant's dying words made a deep impression on the mind of Octavius. The senate, conceiving Antony to be utterly ruined, began to flight Octavius, of whose services, as they thought, they should have no further occasion; and refused his demand of a triumph, which he granted to Decimus Bruto; heaping upon him various honours, and appointing him commander of all the forces in Cisalpine Gaul; charging him at the same time, without even mentioning Octavius, to pursue Antony, and treat him as a public enemy. While Antony, after experiencing some vicissitudes, and after having fled before Bruto and abandoned Italy, was ready to re-enter it with the command of twenty-three legions and above 120,000 horse, Octavius was at Bononia, where he had been endeavouring, by the interdict of Cicerone, to obtain the confidant. But being disappointed with regard to this object of his ambition he resolved no longer to defer his reconciliation with Antony. Accordingly, this business being settled, and a treaty having been concluded between them and Lepidus, of which the senate was wholly ignorant; Octavius being placed at the head of an army, for the purpose of conducting the war, in conjunction with Decimus Bruto, against Antony and Lepidus, marched towards Rome in order to demand the confidant. It was now too late to concert or to carry into effect any measures of resistance. Octavius was received in the capital with the loudest acclamations of the people; he was immediately joined by the legions stationed in the city; and he was unanimously elected first consul, though he had not yet completed his twentieth year. A.U.C. 711. B.C. 43. Immediately after his promotion to the confidant, he procured the confirmation of his adoption in a general assembly of the people; he confirmed the decree against Antony and Lepidus to be revoked; and he invited them into Italy. As they advanced, he went out to meet them; and their meeting took place at a small island formed by the river Reno, now Reggio, which falls into the Po, after having watered the territory of Bononia, or Bologna. Here was planned the famous system of power called the TRIUMVIRATE; which see. Having cemented and disfraced their new connexion by the delightful PROSPERITY, which was to cut off all their enemies public and private, and to fill their treasury by confiscations, and by the mutual sacrifices of some of their nearest friends and relations, among whom was Cicero; they proceeded to Rome, and filled the city with blood and rapine. In fulfillment of one article of the treaty, settled on this occasion, Octavius and Antony prepared for an expedition against Marcus Brutus and Cassius, who had made themselves masters of most of the provinces in the East. Accordingly they passed over into Macedon; and met the republican leaders on the plains of Philippi, where the contest was decided by two battles, the second of which terminated with the death of Brutus. (See BRUTUS.) On this occasion, Octavius, who was actuated by an implausible spirit of revenge against the authors of Caesar's death, was chargeable with a degree of cruelty which fixed an indelible stain upon his reputation. Before his return to Rome, he found a difficulty, and incurred considerable danger, in the distribution of the for-
feited lands among the soldiers. He was also involved in a civil war by the violence of Fulvia, and of Lucius the brother of Antony, which was terminated by the surrender and capitulation of Perusia. On this occasion, Octavianus exercised the most inhuman barbarity. See PERUSIA. After the conclusion of this war, a partition was made of the Roman empire between Antony (see ANTONY) and Octavianus: Rome and the west being allotted to the latter. The next and most important event that engaged the attention of the triumvirs, was the war with Sextus Pompeius. While Octavianus was preparing for this war, he was captivated by the personal and mental charms of Livia, then the wife of Claudius Tiberius Nero. In order to obtain possession of her, he divorced his own wife Scribonia, and caressed Livia to be divorced from her husband, though she was at the time far advanced in her pregnancy, and was, within three months after he married her, delivered of a son, who was named Tiberius, and who was afterwards emperor. The war with Pompey, though at first disastrous, was soon concluded by a general engagement, in which Pompey was entirely defeated.

Upon the deposition of Lepidus from his authority as one of the triumvirs, the Roman state was governed by a triumvirate, which was subject to great imm obility. Antony, growing old, and yet addicted to youthful follies, gave Octavianus advantages, which he had discernment to perceive, and of which he availed himself by his political wisdom. Whil it he ingratiated himself with the people by several popular acts, and was invested with the dignity of perpetual tribune of the people, which rendered his person sacred and inviolable, he contributed by various charges to degrade Antony in the public estimation. The commencement and termination of the civil war, in which Antony and Octavianus were engaged, have been already related under the article ANTONY. It will be sufficient here to say, that it was the succours gained by Octavianus, for which he was chiefly indebted to the conduct of his admiral Agrippa, at the famous battle of Actium, fought in the year B.C. 31, which made him master of the Roman world. Having followed his rival into Egypt, and there terminated the war, he remained in the east two years, and settled all the affairs of Egypt, Greece, Syria, Asia Minor, and the East, in a manner well known.

Upon his return to Rome, he triumphed for three successive days with great splendor. Having attained the summit of his ambition, it now remained with him to determine under what title, and in what mode, he should exercise the supreme authority which he had acquired. That he ever seriously intended to surrender the power which he possessed, and to which he had made such sacrifices, is not at all probable; and yet it is by no means unlikely that he should have conferred with his confidential friends, Maecenas and Agrippa, in a manner which historians have recorded. Agrippa, a man no less famous for his probity than his valour, recommended a general reformation; represented the inevitable dangers which attend monarchy, inapplicable to a free people and to men educated in a commonwealth; portrayed the examples of Sylla and Caesar; and closed his speech with exhorting Octavianus to converse the world, by restoring liberty to his country, that the only motive for his taking up arms was to revenge his father's death. Maecenas, a man of great penetration, and generally esteemed the most refined politician of his age, urged that he had gone too far to recede; that he could be safe only on the throne; and that it was absolutely necessary for the welfare and tranquility of the republic, that the sovereign power should be lodged in one person, and not divided among many individuals, whose ambitious views would still occasion a perpetual succession of murders to the public. Octavianus thanked them both for their friendly advice, but avowed his purpose, a purpose without doubt previously formed, of adhering to the opinion of Maecenas; upon which this sage councillor recommended his governing others as he would wish to be governed himself, if he had been born to obey and not to command; that he might then secure success in all his undertakings; happiness during his life, and reputation after his death; adding, that if he dreaded the name of king, so odious in a commonwealth, he might content himself with the title of 'Caesar' or 'Imperator,' and under that appellation, which was familiar to the Romans, enjoy all the authority of a sovereign. Dio. CAIUS, i. iii. p. 464.

Octavianus, having formed his purpose, began to annul and gratify the people, to adorn the city by public buildings, to new-model the senate by introducing his own partisans, by annulling many unjust and severe laws that had been enacted during the triumvirate, and by reforming a variety of abuses. At length, in his 7th consulate, B.C. 27, in the 36th year of his age, he went to the senate-house, and in a studied oration, which displayed his patriotism and dignified his ambition, he proposed to abdicate his authority. Those who were in the secret applauded; others were greatly embarrassed. But amidst this confusion of sentiments, the answer of the senate was unanimous and decisive. They refused to accept his resignation, and convinced him not to desert the republic which he had saved. After a decent refusals, the crafty tyrant submitted to the orders of the senate; and consented to receive the government of the provinces, and the general command of the Roman armies, under the well-known names of 'Proconsul' and 'Imperator.' But he would receive it only for ten years. At the motion of Munatius Plancus, he also assumed the title of Agustus. The powers which he united in himself, of which none, indeed, were not conferred immediately, were those of 1. 'Imperator,' or 'Emperor,' extended to signify commander-in-chief of all the forces of the state, arbiter of peace and war, and uncontrollable head of the executive power, as well over the citizens as soldiers; 2. Of 'Proconsul,' giving him the legal supervision in every province which he could employ his forces; 3. Of 'Tribune,' rendering his person sacred, and conferring upon him the right of veto on all public proceedings; 4. Of 'Censor,' or superintendent of manners; 5. Of 'Supreme Pontiff,' or the head of religion; 6. Of 'Dispensation' from observing the laws, when he should think fit to execute it. To the preceding privileges of an absolute prince was added the venerable and respectable character of 'Father of his Country,' implying a kind of paternal relation to his people.

Agustus, besides the limitation of ten years which he annexed to the polition of his authority, flattered the senate by sharing with it the government of the provinces, referring to himself those which were most liable to tumults and seditions, that he might thus have at his command all the forces of the empire. He also contrived to retain ancient names, forms, and institutions; and to commit a portion of real authority to the senate, the people, and officers of state; so that his government was rather a monarchy than a despotism.

The first and chief care of Agustus, after he had obtained the dignity of absolute master of the empire, was to satify his soldiers, and attach them more firmly to his interest. With this view he differed them all over Italy in 32 colonies, and thus they might easily be re-assembled in
in case of any sudden commotion. His land forces consisted of 25 legions, of which eight were on the Rhine, four on the Danube, three in Spain, and two in Marmatia. The others were sent into Asia and Africa, four being quartered in the neighborhood of the Emperors and in Syria, two in Egypt, and two in the province of Africa, confirming the ancient dominions of Carthage. The whole number of these, constantly maintained by Augustus, and for some ages by his successors, amounted to 170,560 men. In the vicinity of Rome were always quartered 12 cohorts, about 10,000 men, of which nine were called praetorian cohorts, and the other three city cohorts. They were established to guard the emperor's person, and to maintain the peace of the city. That the former might be faithful, and vigilant in their duty for the safety of the emperor's person, the Senate ordered their pay to be doubled. Besides these numerous and well-disciplined land forces, Augustus kept constantly at sea two powerful fleets; one riding at anchor near Ravenus, in the Upper or Adriatic sea, the other at Milenum, in the Lower or Mediterranean sea.

Augustus, having settled all affairs in the capital, passed into Gaul, towards the close of the year B.C. 27, with the design of proceeding to the reduction of the British islands; but on his arrival at Narbonne, he received information that the Salians at the foot of the Alps, and the Cantabrians and Asturians in Spain, had flanked off the Roman yoke: he therefore discontinued his progress, and marched into person into Spain, for the purpose of subduing those nations that had revolted. The conquest of the Salians he committed to his generals. In the year B.C. 23, Augustus married his daughter Julia to his nephew Marcellus; and in the course of the year he was feized with a dangerous disorder, which threatened his life, of which he was cured by his physician Antonius Musa, who deviated from the common practice in administering cooling potions, and recommending the use of the cold bath. His health was not only restored, but his constitution was rendered more firm and vigorous than it had ever been before. When his life was thought to be in danger, he delivered his ring to Agrippa, thus intimating that he deemed him to be a proper successor. Marcellus, who was generally regarded as his successor, was also at this time favored with this preference; but the death of this prince, which was greatly regretted by the Roman people, made way for the introduction of Agrippa to court, and from this time he continued the most confidential friend of Augustus. At this time the administration of the empire was conducted with great equity and moderation; and many instances are recorded, in which Augustus exercised lenity and self-denial, and recommended himself by the respect which he manifested to the senate and to the courts of justice. In the year B.C. 22, he declined the office of dictator and of censors, which were offered him by the senate, and in his general conduct he affected to appear no other than as a private citizen. To him, it is said, the title of "lord" and "master" was always an object of detestation, because its counterpart was that of a "slave;" and to those who behaved to him with disrespect, and who libelled him in their speeches or writings, he was singularly meek and forgiving. Nevertheles, mild and equitable as was the government of Augustus, several conspiracies were formed against him, during the course of his reign; that of Fannius Caepio and Linius Murens, which was detected, so that the principals were punished, gave occasion to two new laws in the administration of criminal justice; one of which was, that accursed persons might be fired and condemned, though they did not appear, as if they were present; and the other, that judges in criminal cases should give their opinions wantonly, and not by ballot.

Rome being now at peace, Augustus determined to visit the eastern part of the empire; but as it was necessary to invest some person with authority for keeping the city in order during his absence, he appointed Agrippa for this purpose; and in order to annex additional dignity to his character in the discharge of the trust that was committed to him, he gave him in marriage his daughter Julia, the widow of Marcellus. This was the respect with which Agrippa was treated, and so mild and yet so firm was his administration, that Rome hardly perceived that it was beclouded by the authority of Augustus. In his progress through the eastern provinces, during the years B.C. 21 and 20, the emperor recovered from Phraates, king of Parthia, the Roman standards and captives that had been taken from Crassus; he placed Tigranes on the throne of Armenia; and at Samos, to the inhabitants of which he granted the liberty and use of their own laws, he received ambassadors from the remotest part of India. A philosopher, who accompanied these ambassadors, attended the emperor in Athens, and committed himself to the flames in his presence. Augustus, after his return, directed his attention to various abuses which needed reform, and to the enactment of regulations that contributed to the perfection of government. He reduced the number of senators from one thousand to five hundred, and fixed at a higher rate the fortune that was requisite for qualifying a person to be elected of that body; and that no persons, who were eminently fit for the office, might be excluded, he made up their deficiencies of fortune by his own liberality. He also introduced some other regulations for restraining the licentiousness and depravity of morals that too generally prevailed; and particularly such as concerned the nuptial state, though rigour in this latter respect did not well become the emperor, who was known to have intrigues with the wives of several men of rank, and who had taken great licence in the privilege of divorce. Augustus increased the tax on celibacy, and granted privileges and rewards to married persons who had several children. See PAPIAN-PORR-ER. Sumptuary laws and regulations respecting the public spectacles, and the supplication of riots and disorders among the spectators, also occupied his attention. In the year of Rome 737, B.C. 17, he celebrated the featural games with extraordinary splendor. About this time he also adopted his two grandsons Caius and Lucius; the children of Agrippa and Julia. Having received from Gaul many complaints against the attendants whom he had appointed to levy the tributes and imposts and particularly against Licius, he visited that country; but the principal aggressor, Licius, contrived to lose his displeasure by giving him a great part of the treasures which he had amassed. Upon his return from Gaul, B.C. 15, the death of Lepidus afforded him an opportunity of alumming the office of supreme pontiff; and in the first exercise of this authority, he collected all books of divination and pretended oracles, of which more than 2000 were committed to the flames. The books of the Sibyl, however, were entrusted to the custody of the priests. The death of Agrippa was, at this time, a very distressing event to Augustus (see AGrippa); but it served to advance Tiberius in the family of the emperor, who by an unwarrantable act of tyranny caused him to be divorced from a wife to whom he was affectionately attached, and to marry the widowed Julia, of whose irregularities he was well apprised.

In the prosecution of the German war, Drusus distingushed himself by his successes, and extended his arms as far
far as the Elbe; but as he was returning to the banks of the Rhine, illnss or accident occasioned his death, B. C. 9. His brother Tiberius also reduced the Pannonians and Da-
cians, and completed the work which Drufus had begun. These events terminated in a general peace through the whole Roman empire, and the temple of Janus was shut, for the third time, in this reign, and remained in this state about 12 years. Before this time Augustus had lost his beloved sister Octavia, who never recovered the death of her son Marcellus; and this affrighted event was succeeded by the decease of his favourite minister Mæcenas, between whom and Augustus a coolness had subsisted, which is said to have been owing to the emperor's intrigues with his wife, Terentia. During this period, however, Augustus received many unequivocal testimonies of the attachment and affection of the people (Suet. Aug. 57—60); and after enjoying the imperial authority for 20 years, he was unanimously requested to accept it for 10 years more. The year 8 B.C. was rendered memorable by the reform introduced by Augustus into the calendar. (See Bissextile, and Calendar.) About the year B.C. 6, the ambition of the young Caesars, Caius and Lucius, the adopted sons of Augustus, began to give him uneasiness; and the jealousy which subsisted between them and Tiberius induced the latter to request the liberty of retiring to Rhodes, which was reluctantly granted, and whence he was not allowed to return for seven years. On occasion of Caius Caesar's assuming the toga virilis in the year 5 B.C.; Augustus accepted the confidate for the twelfth time; and this year (four years before the vulgar era), was rendered singularly illustrious by the birth of Jesus Christ. When Lucius Caesar took the toga virilis in the year 2 B.C.; Augustus became con-
ful for the thirteenth and last time. But this year was em-
bittered to him by the discovery of the very licentious and shameful conduct of his daughter Julia, which had been for some time known to every one but himself. After deliber-
ating whether her punishment should be death or exile, he determined to divorce her from Tiberius, and to banish her to the island of Pandataria on the coast of Campania, where she was allowed merely necessaries, and whence she was never recalled. Of those with whom he had criminal intercourse, some were exiled, and others put to death.

Augustus, having lost his two adopted sons; Caius having died A.D. 3, of a wound which he received in Armenia, and Lucius at Marseilles, A.D. 2; had no hopes of perpetuating any of his own family on the imperial throne. He therefore recalled Tiberius from Rhodes, and adopted him some months after the death of Caius Caesar. He also adopted the lioth of his grandchildren Agrippa Posthumus; but his untractable disposition and grofs manners induced him afterwards to annul his adoption, and to banish him to the isle of Planaria or Pianofa, on the south of the isle of the Elbe. The emperor likewise obliged Tiberius to adopt Germanicus, the son of Drusus.

In the year 4, Augustus, who was a fifth time continued as commander in chief of the armies, and in the government of the provinces in his department, prosecuted his labours for settling the civil administration of the republic. He again reviewed the senate, numbered the inhabitants of Italy, and established some other regulations for the benefit of the state. But of all the occurrences of this year, the most glorious for Augustus was the pardon of Cinna, Pompey's grandson; who was accused of a conspiracy against his life. Having admitted the criminal into his closet, he reminded him of the favours which had been conferred upon him, and charged him with the ingratitude of his design; and then closed an address of twelve hours with these words: "Again, Cinna, I give you your life: I spared you, though you were my enemy; I now forgive you, though to that name you have added those of traitor and parnicius. Let us from this day begin to be sincere friends; let us vie with each other; I, to support the good I have done; you, to make a suitable return; let us try to make it a doubt whether I am most generous, or you most grateful." The emperor named him confial for the next year; and from this time, Cinna, overcome by the emperor's goodness, became his faithful and zealous friend; and when he died, made Augustus his sole heir. The clemency of Augustus on this occasion interested the people so much in his favour, that no conspiracy was ever more attempted against him.

The conduct of Julia, the grand-daughter of Augustus, who copied after her mother's example, offended and griev-
ed him; and he banished her A.D. 5, to the isle of Trime-
tum, now Terni, on the gulf of Venice. The poet Ovid, who is supposed to have participated her guilt, was banished at the same time, to Tomi in Scythia, on the borders of the Euxine sea. The two Julias, and Agrippa Posthumus, sud-
ly interrupted the domestic felicity of Augustus, so that he used to call them his three enemies, his three alpaca; he never heard their names without a sigh, and often applied to them a verse of Homer, II. iii. 40.

"AimOLS 'E'AO 'T'OGV 'EIANI, 'EAO 'AIOV.'

i.r. "Would to heaven I had never married, but had died without posterity."

In the following year, A.D. 10, the destruction of Varus with three entire legions in Germany, in consequence of a confederaet formed by Arminius, the lofs of the standards of the legions, and two of their eagles, and the inoffence and cruelty with which the captives were treated by the conqueror, were the occasion of great disturb and terror at Rome. Augustus, accoustioned to glory and prosperity, in-
mented this humiliating and disastrous event with the excess of sorrow. He not only put on mourning, and suffered his beard and hair to grow, but often exclaimed in an agony, "Return me my legions, Varus." As long as he lived, the day of Varus's defeat was observed by him as a day of an-
ual regret and sorrow. Tiberius, however, by his military skill restrained the ravages of the Germans, re-established the reputation of the Roman arms, and relieved Rome amid its anxiety and fears. Augustus was highly gratified by his successes, expressed his approbation in very strong and affectionate terms, and raised him to an equal share of the imperial authority. Upon his return to Rome A.D. 13, he obtained a magnificent triumph. Towards the close of his life Augustus enacted several regulations, which under succeeding emperors became the means of extending and vindicating tyranny and despotism. As he was unable to go frequently to the senate, he caus'd his privy council to be invested with the authority of the whole body; he also weaken'd the power of the people, which his succes-sor actually annihilated, by nominating magistrates, whom they had been accustomed to elect, and by authoritatively recommending to the people such as he chose to have employed. He likewise revived and extended an old law, which was levelled against actions detrimental to the state, by enacting that all authors of defamatory libels should be guilty of high treason, and punished accordingly. As his health and strength declined, he devolved the principal cares of empire upon Tiberius. The accept of the complaint that terminated in his death has been, without sufficient reason, attributed to poison, ad-
ministered by his wife Livia, who was alarmed, on account of her own son, by his returning affection to his grandson, Agrrippa Posthumus. But the truth is, that his disorder

was
was owing to a weakness of the stomach and bowels; and he was filled with it, as he was conducting Tibullus towards Illyrnum. On his return towards Rome, his complaint increased and obliged him to flit to Nola, where he took to his bed, and impatiently waited the approach of death. On the last day of his life, he called for a mirror; he had his head decked, and something to be done which might prevent his checks from appearing fink; and then calling his friends to his bedside, asked them, whether they did not think he had acted his part pretty well in the comedy of human life? and then addressed them in a Greek verse, with which they generally closed their plays:

"...dote, nunc penitus, viri minor usque nux tua..."

i. e. "Clap your hands, and let all applaud with joy."

After this kind of comic adieu, he ordered every body to retire, and died in Livia's arms: saying, "Livia, ce fugi me moritem, vive et vale," i.e. Livia, farewell, forget not a husband who has loved you tenderly." His death happened on the 19th of August, A. D. 14, A. U. C. 767, and in the seventy-sixth year of his age. The duration of his power, if we reckon from the time of the triumvirate, of which he took possession the 27th of November, in the year of Rome 711, B. C. 43, was about 56 years. If we reckon from the battle of Actium, fought the 4th of September, in the year of Rome 721, B. C. 31, when his sole possession of the Roman empire properly commenced, Augustus will then appear to have enjoyed the sovereign power about forty-four years. Crever rates the true time of his becoming emperor to have been the 7th of January, in the year of his seventh consulship, which, according to his reckoning, was the 723rd of Rome, and referring his death to the 767th of Rome, he governed as prince and emperor forty years, seven months, and thirteen days. "All the rest (he says) was manifest usurpation and tyranny." Josephus (Ant. L. xvii. c. 2. § 2. D. Bell. ii. c. 9. § 1.), and others after him, compute the beginning of the reign of Augustus from the year in which Caesar was killed, A. U. C. 710, B. C. 44, and make its duration fifty-seven years, six months, and some odd days. Polyanus, in his canzon, and St. Clement of Alexandria (Str. l. i. i. p. 405. ed Potter.), date the commencement of his reign in the year after the battle of Actium, A. U. C. 724, and compute its duration to be forty-three years.

Before the funeral of Augustus, his will was presented to the female-honour by the veiled virgins, in whose custody it had been deposited, and read aloud by Polybius, one of his freedmen. By this will, made sixteen months before his death, Tibullus and Livia were appointed his first heirs, his grand-children and their children his second, and the great men of Rome his third heirs. Livia was adopted into the Julian family, and honoured with the title of Augusta. He bequeathed, as a legacy, forty millions of sesterces (about 5,000,000 livres) to the Roman people; three millions five hundred thousand (4,575,000 livres) to the tribes, that is an hundred thousand (12,500 livres) to each; to each of his guards a thousand sesterces (125 livres); to each of the soldiers appointed to guard the city 500 sesterces (62 livres); and to each legionary soldier 300 sesterces (37 livres). Augustus left also four memorials, written by his own hand, which were produced to the Senate by Drusus. The first of these contained regulations relating to his obsequies; the second was a journal of the most memorable actions of his life, which he ordered to be engraved on the pillars of brass which supported the frontpiece of his flaccus manufectum; part of which has been preserved in an ancient marble, found about 200 years ago in the city of Anzepa; the third contained a summary of the strength and income of the empire; and the fourth was a summary of instructions for the use of Tibullus, and the other governors and magistrates of the republic.

The funeral of Augustus was performed with very extraordinary magnificence. After a short eulogium by Drusus, and a funeral oration by Tibullus, fire was let to the pile in the Campus Martius, on which his body was laid, and at this moment an eagle was let loose from the top of it, to carry his soul to heaven. His ashes were collected by Livia, and enclosed in an urn of gold, which she deposited in the mausoleum erected by Augustus in a grove between the Tiber and the Flaminian way. After the funeral, divine worship was decreed to him, with a temple and priests; the house in which he was born, that in which he died, and most of the houses in which he had lived, were converted into funeraries. Livia assumed the office of chief priestess to the new deity; and made a present of a million of sicles to an old priest, named Numerius Atticus, who favored that he saw the soul of Augustus in its flight to heaven.

The character of Augustus appears under very different aspects in the various periods of his life and reign. In the outset of his career of ambition, he was crafty and dissembling (Gen. Biog.), violent and fanatical; but as he advanced in years, and after he had attained the object of his views, he was, in his general conduct, mild, affable, and conciliating. In the exercise of that sovereign and absolute power, which he acquired by means which none can attempt to justify, and which he contrived most effectually to secure by apparent moderation and false-deny, he seems to have been the most industrious for making the people contented; and happy; and in many respects he was entitled to the character of a wise and equitable governor. "As a compensation for liberty," says one of his biographers, "he gave his subjects security, ease, prosperity, and all the advantages of high civilization, with as little as possible of the severity of restraint and coercion. He filled Rome and all Italy with improvements of every kind; made highways, conduc- ed buildings for use and convenience, and could boast that he received a capital built of brick, and left one of marble. He encouraged letters, that one of the great ages of excellent human productions takes its name from him." (See Aggi.) Those whom he encouraged by his liberality, repaid him with an adulation, which was not honourable to themselves, and which made no addition to his reputation. The love of flattery, however, is not charged upon him as one of his predominant foibles. In private life he had many estimable qualities. Affectionate to his family and friends, condescending and indulgent to his domestics and dependents, frugal and sober with regard to every indulgence, one excepted, which regarded himself; he commanded affection and respect. But his disposition to gallantry and licentiousness in his conduct towards the female sex, exposed him to just censure and reproach; nor did the counsel of his friends (see Athenodorus), nor the wisdom of experience, avail to the due restraint of his criminal passions. Sometimes indeed, it has been said, his intrigues were the result of that policy which directed his general conduct, as they were to discover secrets of state, and to obtain information concerning any plot or sedition that might have been formed by the husbands of those wives with whom he was connected. In other respects he paid a high regard to external, decorum; and whatever might have been his sentiments with regard to religion in early life, he appears in mature and more advanced age to have been much inclined to superstition. He took great pains to establish order in every branch of the administration whom he lived and recommended it to his successors not to exceed the limits of an empire that was already
ready too large. — Upon the whole," says the biographer above cited, "if not entitled to rank among the greatest and best of mankind, he will be ever respected as one of those sovereigns whose personal qualities had a great influence in promoting the happiness of the people he governed."

A popular historian (see Gibbon’s Hist. vol. i. p. 114.) has given the following sketch of the character and history of Augustus. "The tender respect of Augustus for a free constitution which he had deified, can only be explained by an attentive consideration of the character of that subtile tyrant. A cool head, an unfeeling heart, and a cowardly disposition, prompted him, at the age of nineteen, to assume the mask of hypocrisy, which he never afterwards laid aside. With the same hand, and probably with the same temper, he signed the prostration of Cicero, and the pardon of Cinna. His virtues, and even his vices, were artificial, and according to the various dictates of his interest, he was at first the enemy, and at last the father of the Roman world. When he framed the artful system of the imperial authority, his moderation was inspired by his fears. He wished to deceived the people by an image of civil liberty, and the armies by an image of civil government. " Among the ancients, the principal writers who have portrayed the character and reign of Augustus, are Suetonius, Dio Cassius, Velleius Paterculus, and Tacitus. Julian (Caesar, p. 329.) says of him, that as Octavius advanced to the banquet of the Caesars, his colour changed like that of the cameoleon; pale at first, then red, afterwards black, he at last assumed the mild liveliness of Venus and the graces. Horace, in the introduction to the first epitile of the second book, gives the following feber and judicious summation of the emperor’s characteristic merits:"

"

"Cum tot fultines, et tanta negotia, folus:
Res Italas armis tuercis, moribus ornes,
Legibus emendes; in publica commoda peccem,
Si longo formone morer tua tempora, Cesar."

AUGUSTUS, Fort, in Geography, a small fortress seated on a plain at the head of Loch Nevis, in Scotland, between the rivers Tarf and Oich, just where they discharge themselves into the lake. The fortress consists of four small batallions; and now exhibits tokens of decay, though a governor constantly resides in it, and all the regulations of a garrison are observed in it. It was taken by the rebels in 1746, who, after doing it all the injury in their power, deferted it. Its distance from the sea prevents its being of any further service, in a tranquil climate of the country, than that of affording a retreat for a few invalid officers and soldiers. A small village lies behind the fort, and it serves as a kind of resting-place in the way to the isle of Sky, distant from it about 52 miles.

AUGUSTUSBURG, a town of Germany, in Upper Saxony, and circle of Erzgebirg, seven miles east of Chemnitz.

AUGUY-L’AN-NEUF, or AUGUILLANÈUF. See MULHOUSE.

AUHAF, in Geography, a town of Germany, in the archduchy of Austria, six miles south-fourth-welt of Ips.

AVIA, in Ancient Geography, a town of Hispania Tarraconensis, in the country of the Vaccares.— Also, a town of Italy, in the territory of the Velini. Potenxio.

AVIANO, in Geography, a town of Italy, belonging to the state of Venice, in the province of Friuli, twenty-eight miles west of Udina, and fifteen E. S. E. of Belluno.

AVIARY, formed of avi, bird, a house or apartment kept for the keeping, feeding, and propagating of birds.

AVICENNA, in Beloei called after the famous oriental physician Avicenna. Lin. g. 1237. Stræb. 1073. Jacq. Amer. 1778. t. 112. Jul. 118. Claus. de hæmatiwm angioperm. Nat. Ord. Perseae. Fil. Jul. Gen. Char. Gen. perinnat five-parted, permanent, leafless subulate, oblong, concave, erect; increased by three faiths. Calyx, monopetalous; tube bell-shaped, short; border bilabiate; upper lip square, crenarurate, flat; lower divided, divaricate ovate, equal, flat. Stem. filaments four, subulate, erect, the two front ones rather shorter, bent back to the upper lip; anthra roundish, twin. Piper. germ ovate; style subulate, erect, the length of the flower. Vigna bifida, acute; the lower division bent down. Per. calycis coriaceous, rhomboidal, compressed, one-celled, two-valved; seed one, large, the form of the calyx, contracted of four fleshy folds, garnetizing.

Species. 1. A. tom. major. Jacq. l.c. Botia gemmata, Brown Jan. 205. Mangia. Sloane Jan. 2. 66. Popula, Rhed. Mal. 4. t. 45. "Leaves cordate, ovate, tomentofoe, underneath." This tree is like the mangrove, rising about sixteen feet high. Its trunk is covered with smooth, whitish green bark, and the twigs from the stem propagate the tree like those of the mangrove. The leaves appear at the base of the branches, on very small petioles, opposite, smooth, soft, having a large dark-green rib; flowers many, at the tip of the branches, white, four-petalled. A native of the East and West Indies. 2. A. nitida. Jacq. Amer. 1778. t. 112. f. 1. Pict. t. 169. "Leaves lanceolate, shining on both sides." Height forty feet; leaves sharp, entire, opposite, on short petioles; peduncles racemose, a little branched, terminal; flowers yellow, white, with a brown mark on the middle segment of the under lip. A native of Martinique. 3. A. p. major. Forl. "Leaves ovate-lanceolate, tomentose, underneath." The leaves of this tree are opposite, petiolate, coriaceous, entire, sharp, shining above, and having a yellowish sap beneath; peduncles terminating, subfusiform, loaded with a head of flowers. A native of New Zealand. The much esteemed green-coloured gum used by the natives of New Zealand, is supposed to be the produce of this tree.

AVICELLA, in Cancology, a name affixed by Rumpius, to that species of Myrtus since called Myrtillus Hung. Lin. and Gmel. AVICULARIA, in Entomology, a species of Araeae or spider that inhabits South America. The thorax is oblong and convex, with a transverse excavation in the centre. This is the largest species of its genus known; and is such a formidable creature that it not only attacks insects, but even small birds, dropping from the branches of trees into their nests and sucking their blood. The fangs are as large as the talons of a hawk; body brown; abdomen oblong; legs with brown rings.

AVICULARIA, a species of Hipsosca, with obtuse wings and thorax of one colour, or immaculate. Infigures the body of birds, and particularly swallows. Dasyge. Donov. Brit. Inf. &c.

AVIDA, a species of Phalæna (Noctua), that inhabits India. The wings are shining brown; ligament spot, and band behind, ferruginous; posterior wings white. Fabricius. This is the middle race, and blackish.

AVIENUS, Rufus Fertus, in Biography, a Latin Vol. III.
their altars and their fants, were left in a state of poverty and decay; and Rome was often painted under the image of a desolate nation. But it was alleged, that the cloud which hung over the seven hills, would be dispelled by the preference of their lawful sovereign; eternal fame, the prosperity of Rome, and the peace of Italy, would be the recompense of the people who should dare to embrace this generous resolution. Of the five popes to whom Petrarca addressed his exhortations, the three first, John XXII., Benedict X., and Clement VI., were important or amiable by the boli

The growing奢望Gregory P., 1612, 1445, the pretence

be all the repairs of the city, but the memorable change, which had been attended by Urban V., between the years 1357 and 1379, was finally accomplished by Gregory XI. A.D. 1377, who did not survive his return to the Vatican above fourteen months. His decease was followed by the "Great Western schism," which began after the decree of Gregory XI., A.D. 1378, by the election of Clement VII. In opposition to Urban VI., and continued for about forty years, till the council of Constance, A.D. 1414—1418, when the elevation of Martin V. was the era of the restoration and establishment of the popes in the Vatican. During this interval, there were two popes, one residing at Rome or in Italy, and the other at Avignon. See SCHEM.

This city is about three miles and two furlongs in circumference, and is in general irregular and badly built; but it is surrounded by walls and turrets with battlements, not unlike those of Rome, and its public edifices are large and grand, according to the taste of the fourteenth century. The church of Notre Dame is ancient, and is one of the best adorned in the city; the archiepiscopal palace overlooks the Rhone, the city, and the fields. These buildings, together with the mint, adorn a large square, which is the common walk of the inhabitants. The church of the Cordeliers is very magnificent, and is full of fine monuments. The university has four colleges; the place in which the Jews have been accustomd to live is a distinct quarter; and those who pay tribute are forbidden to leave it without yellow hats, and the women also wear something yellow about their heads; and they are thus distinguished from the Christians. Their number is considerable, though the district of their residence is very confined. Near the Rhone is a large rock, within the circuit of the walls, upon which is a platform, whence the whole city and the places about it may be seen. The bridge, about a quarter of a mile in length, that crossed the Rhone, was demolished by an inundation in 1669. The fountain of Vaucluse, which is the source of the river Sorgues that waters the city, and whither Petrarca often repaired to indulge his grief and hopeless love, is situated in a winding valley, forming the figure of a horse-shoe, about five miles from Avignon. The fountain is a hafon of water, several hundred feet in circumference, very deep, and clear as crystal, but overshadowed by an incumbent rock. The water discharged from this fountain, by a narrow passagé, forms a cascade, which is precipitated along a rocky channel. The rocks, which invest this romantic spot, are worn by time and the inclemency of the weather, into a thousand fantastic forms. And on one of the pointed extremities, in a situation almost inaccessible, are seen the remains of an ancient castle, projecting over the water, called by the peasants "Il Castello di Petrarca;" and they add, that Laura lived upon the opposite side of the river, under the bed of which was a subterraneous passagé, by which the two lovers visited each other. The residence of the poet was much lower down, and nearer to the banks of the Sorgues, as appears from his account of it, and from his relation of his contests with the naiads of the stream, who during winter encroached on his small adjoining territory: but no remains of it are now to be discovered. Below the bridge is an island, where the Sorgues joins the Rhone, in which are several houses of pleasure. The inhabitants of Avignon were establisht before the revolution at 30,000, 1000 of these being ecclesiastics, and some hundreds of the former includes 321, and that of the latter 421 kilomètres, and they both comprehend one commune. N. lat. 45° 56' 58". E. long. 4° 48' 10".

AVIGNON-Berry, called also French Berry, in Botany, is the fruit of a shrub, by some authors called lycium; growing plentifully near Avignon, and other parts of France. See LYCUM.

AVIGNONET, in Geography, a town of France, in the department of the Upper Garonne, and chief place of a canton in the district of Villefranche, twenty miles south-east of Toulouse, and four miles south-east of Villefranche.

AVILA, Gilles Gonzales, in Biography, a Spanish ecclesiastic and historian of the seventeenth century, was a native of Avila, and acquired at Rome, where he studied, a great knowledge of sacred and civil history. On his return to Spain, he had an ecclesiastical benefice at Salamanca; and in 1612, he removed to Madrid, and was appointed historiographer to the king. He died in 1658, at the age of 80 years. His principal works, published in Spanish, were "The History of the Antiquities of Salamanca," and "The theatre of the Churches of the Indies, &c." Nouv. Dict. Hist.

Avila, in Geography, a city of Spain, in Old Castile, seated on the river Adaja, on a large plain surrounded with mountains and plantations of fruit-trees and vineyards, and having a manufacture of cloths, that are said to be equal to those of Segovia. It is fortified by nature and art, having a wall 9075 feet in circuit, with twenty-six lofty towers, and ten handsome gates. It has seventeen principal streets, containing several good and stately houses; nine squares, 2000 houses, nine parishes, and as many monasteries, seven nunneries, two colleges, nine hospitals, eighteen chapels, and an annual allowance of 10,000 ducats for the maintenance of orphans and other poor people. The university was founded in 1445, confirmed by pope Gregory XIII. in 1538, and afterwards enlarged; and its cathedral has eight dignitaries, twenty canons, and the same number of minor canons. N. lat. 40° 33' W. long. 4° 13'.

This city has been rendered famous by the deposition of Henry IV. A.D. 1615. The indignation of the Castillian nobility against the weak and frivolous administration of this prince, led them to combine against him, and to execute the right, which they arrogated as one of the privileges of their order, of trying and of passing sentence on their sovereign. For this purpose they erected a spacious theatre in a place without the walls of the town, and having prepared an image, clad in royal robes, representing the king, they placed it on a throne, with a crown on its head, a sceptre in its hand, and the sword of justice by its side. The accucion against the king was then read, and the sentence of deposition was pronounced in presence of a numerous assembly; and whilst the several charges were delivered, they proceeded to tear the crown from the head of the image, to snatch the sword of justice from its side, to wrest the sceptre from its hand, and, at the close of the whole, to tumble it headlong from the throne. When this ceremony was fulfilled, Don Alfonso, Henry's brother, was proclaimed king of Castile and Leon in his stead. Robertson Hist. Ch. V. vol. i. p. 179.

Avila, or Alaba, a town of Spain, in Altoria, near the bay of Biscay, nine leagues from Oviedo.
AVILA. A city of South America, in the province of Quito, and government of Quixos, situate in S. lat. 2° 44', and about 2° 20' E. of Quito. It is less than Archidona, a small city lying in S. lat. one degree and a few minutes, and about one degree fifty minutes E. of Quito. Like this latter place, its houses are of wood covered with straw; and as the whole number of inhabitants in Archidona is reckoned at 650 or 700, confints of Spaniards, Indians, Melitoreos, and Malatoes, those of Avila scarcely amount to 300 of both sexes. Like the other it has one priest; and his ecclesiastical jurisdiction comprehends fix towns; viz. La Conception, Loreto, San Salvador, Motte, Costa Phil, and Santa Rosia.

AVILA Fuente, a town of Spain, in old Calilie, fix leagues from Segovia.

AVILIER, Augustin-Charles D', in Biography, an eminent French architect, was born at Paris in 1653, and from his youth devoted himself to the study of architecture. In his way to Rome, whither he was sent for improvement by the royal academy, at the age of twenty, he was carried into slavery by an Algerine corsair, and in this situation he manifested his talents by making a design for a grand mosque at Tunis. After sixteen months he was liberated, and pursued his studies at Rome for five years. On his return he was placed under Mansart, first architect to the king, and had a principal concern in the conduct of all public works. His "Courte de Architecture" was founded on the work of Vignola; but by the enlargement of that writer's plan, was rendered a complete treatise of the art. It has been much enlarged: the first edition was that of 1691, 2 vols. 4to. and it has since passed through several other editions. Being invited to Montpellier, he superintended the construction of a grand triumphal arch to Louis XIV., was afterwards appointed architect to the province of Languedoc, and besides other buildings in which he was employed, he erected the archi-episcopal palace at Toulouse. He died at Montpellier in 1700. Moreri. Gen. Biog.

AVINO, in Geography, a town of North America, in the province of New Galicia, where the Spaniards have a silver mine; between Durango and Elerrema.

AVINO, La Panca, a town of North America, in the western part of the kingdom of Leon, between two of the head-branches of the Nafis river.

AVIORA, a town of Atlaic Turkey, in Caramania, sixty miles north-east of Tocot.

AVIOTTH, a town of France, in the department of the Meafe, and chief place of a canton in the district of Stenay, three miles north of Montmeday.

AVIRA, in Ancient Geography, a town of Asia, in the Palmvrene, Prolemly.

AVIS Indicus, in Astronomy. See AVUS.

AVIS, or AVIOTH, in Geography, a town of Portugal, in the province of Alentejo, giving name to an order of knights; three leagues west of Elremos. The land surrounding it is covered with cactus, which is usually cut down once in eight years and burnt, and the ground foun with corn. N. lat. 38° 45’. W. long. 7½.

AVIS, in Heraldry, a military order of knighthood, instituted by Alphonfo Henriques king of Portugal, in 1142, in testimony of the great services done for him at the siege of Lisbon, by the nobility led to his assistance by Don Ferdinand Rodriguez de Monteypio, whom he appointed to be their grand master. For some years after they were called Nouvelle Miace, or the new military; which appellation continued until the year 1166, when they having taken Evora by surprize, the king conferred on them the government of that town, and commanded that they should henceforth be called Knights of Evora; lastly, the same king, having in the year 1181, taken from the Moors a place very advantageously situated, and called Avis, granted the same to the before-mentioned knights, on condition that they should build a fort in that place, and reside therein. The knights accordingly transplanted themselves thither, and from that time took the denomination of Evord d’Avis. In the year 1204, pope Innocent III. confirmed this order. The badge of the order is a croq, flory, encamelled vert, between each angle a fleur-de-lys or; which they wear pendant to a green ribbon round the neck; and the same badge is embroidered on the left shoulder of the robe of flate, which is of white furb.

AVIS, Bird. Aves, Birds, among Naturalists, the second class of animals; a race of creatures sufficiently distinguished from the others in having the body covered with feathers, two feet and two wings, formed for flight. Birds have the mandible protracted and naked, and are deficient of external ears, lips, teeth, scrotum, womb, urinary vesicle or bladder, epiglottis, corpus callosum, or its fornix (covering the two lateral ventricles of the brain, or its arch) and diaphragm. In the Linnean system, birds are divided into fix orders; viz. accipitres, pice, auvres, galura, gallina, and paffere. See Ornithology.

AVIS, Longis, in Ornithology, a name given by Nieremberg to the hoitlattotl of the Americans, a bird remarkable for its swiftness in running. The hoitlattotl appears to be the phaianus mexicanus of Gmelin, and courter phaeon of Latham.

AVIS Nirea, a name under which Nieremberg has described an American bird of the size of a thrush, of a brown and black colour on the back, and yellow under the belly; it imitates the human voice, and is called by the natives caoa.

AVIS Pennipulchra, the name of an American bird described by Nieremberg, and called by the Indians quato altolotl. It is the size of a pigeon, and is said to be all over the body of the more beautiful colours of the peacock. The species alluded to is not accurately known; and Ray has arranged it with some others, as doubtful kinds.

AVIS Scira, or Hoadli. See ARDEA HOACTLI, Gmelin, and Hoalt, Buffon.

AVIS Tropicorum, and avis rubas forcentas, the name of a bird, among old authors, called in English the tropic bird; and by Gmelin PHAEON AETHEREUS.

AVIS Tenti, "the bird of the wind," or heathhtotl, ecutadotl, f. avis venti altera, Ray, &c. obidate names of the Mergus Engulcus, or bondet margener, of America.

AVIS Paradisi, bird of Paradise. See Paradisa.

AVIS Mexicant, grandis rubra, Sbba. See LORIX MEXICAN.

AVIS Quarta piperin, Gfex. See EMERIZA NIVALIS.

AVIS Americana cristata rubatra, Sbba. See PIPA RUB.

AVIS Mexicana altera, Sbba. See PIPA ERTHROCH.

AVIS, in Geography, a town of Piedmont, in the duchy of Aoila, in the grand Doria, eight miles west of Aoila.

AVISO, a town of Italy, in the kingdom of Naples, and country of Lavora, six miles east of Sora.

AVIS, Italian, adviso, chiefly used in matters of Commerce, denotes advice, piece of intelligence, or advertisement, to notify some event or matter worthy of knowledge.

AVISON, Charles, in Biography, organist of New-calk, was an ingenious and polished man, esteemed and respected by all who knew him; and an elegant writer upon his art. He had visited Italy early in his youth, and at his return, having received instructions from Gem الخارك, a bis
in his Compositions for Violins, and in his Essay on Musical Expression, towards that matter, is manifest. Ramoneus was likewise his model in harpsichord music; and Marcello's complaints were much over-rated by him, in order to depreciate Handel, whom he censured more by implication than open hostility. We find in his book, which is elegantly written, and in the prefaces to his musical compositions, many prejudies, particularly against German symphonies; ascribing to them the corruption and decay of music. His compositions for the harpsichord, when played by the late lady Milbanke, and accompanied by Giardini, had a pleasing effect. They were formed on the plan of Ramoneus's concertos, as those for violins were on the concertos of Geminiani; and there was the same difference between them in point of excellence, as is always discoverable between an original production, and an imitation.

His violin concertos were revived, after they became of age, at the concert of ancient music; where 20 years are the period which renders musical compositions venerable. Here they are still played in turn with those of Corelli, Geminiani, Handel, and San Martini; with those productions, however, they but ill support a parallel: they want force, correctness, and originality, sufficient to be ranked very high among the works of masters of the first class.

AVITUS, SEXTUS AULUS ECEIDICUS, a Christian divine, bishop of Vienna in France, was nephew to Marcus Marcellus Avitus, emperor of the West, and flourished at the beginning of the 5th century. He succeeded his father Lupus in the see of Vienna, in the year 490. He was the friend of Clovis, the first Christian king of France, and contributed to his conversion. As a zealous opponent of the Arians, he reclaimed Gondealb, king of the Burgundians, from his connection with this sect, to the Catholic faith; he prefided in the council of Epaon in 517, and in that of Lyons in 523, in which year he died. He wrote 87 letters on subjects that formed the disputes of the age in which he lived, sermons, and poems on the Mosiac history, and in praise of virginity. His style is said to have been harsh, obscure, and intricate. His works were published by Simmond in 8vo. with notes, in 1643. His poems have been printed separately at Frankfurt, in 1507, at Paris in 1509, and at Lyons in 1530. Cave Hill. Lit. vol. i. p. 461. Nouv. Dict. Hill.

AVIUS, in Entomology, a species of Papilio (Hesperia, Fabr.), with entire wings, above and beneath brown, with two blue streaks near the tip. This insect inhabits India.

AVIUS, in Geography, a town of France, in the department of Arques, in the region of Aisne, and chief place of a canton in the district of Epernay, 6 leagues south of Rheims. The place contains 1296, and the canton 5761 inhabitants: the territory includes 190 square kilometres and 19 communes.

AUK, or AWK, in Ornithology. See ALE.

AUKEB, the Arabic name of the great eagle.

AUKLAND, or Bishop Aukland, in Geography. See AUCKLAND.

AUL, or Saw.

AULA, in our Ancient Law Books, signifies a court baron.—Aula ibidem tanta quarto die Augus., &c.

Aula ecclesiæ is sometimes used for what we now call novis ecclesiis. See NAVE.

Aula regis, or regis, a court established by William the Conqueror in his own hall, composed of the king's great officers of state, who resided in his palace, and were usually attendant on his person. These were the lord high constable and lord marshal, who chiefly presided in matters of honour and of arms, determining according to the law military and the law of nations; the lord high steward, and lord great chamberlain; the steward of the household; the lord chancellor, whose peculiar office it was to keep the king's seal, and examine all such writs, grants, and letters, as were to pass under that authority; and the lord high treasurer, who was the principal adviser in all matters relating to the revenue. These high officers were allied by certain persons learned in the laws, who were called the king's juricici or juricices; and by the greater barons of parliament, all of whom had a seat in the "Aula Regia," and formed a kind of court of appeal, or rather of advice, in matters of great moment and difficulty. All those, in their several departments, transmitted all secular business both bilateral and civil, and likewise the matters of the revenue; and over all presided one special magistrature, called the chief juricic; or "capitalejuricicariototiusAngley," who was also the principal minister of state, the second man in the kingdom, and by virtue of his office guardian of the realm in the king's absence. This great officer principally determined the vast variety of causes that arose in his extensive jurisdictions; and from the plenitude of his power, he became obnoxious to the people, and dangerous to the government which employed him. This formidable tribunal, which received appeals from all the courts of the barons, and decided in the last resort on the estates, honour, and lives of the barons themselves; and which, being wholly composed of the great officers of the crown, exercizable at the king's pleasure, and having the king himself for president, kept the first nobleman in the kingdom under the familiar control as the minister fubject.

This great universal court being bound to follow the king's pleasure in all his prerogatives and expeditions, the trial of common causes was found very burdensome to the subject; and, therefore, king John, who also dreaded the power of the juricice, very readily consented to that article, which now forms the 11th chapter of Magna Carta, and enacts, "that communia placita non sequantur carent regis, sed tenentur in aliquo certo loco." This certain place was established in Westminster-Hall, the place where the "aula regis" originally sat, when the king resided in that city; and there it hath ever since continued. The court being thus rendered fixed and stationary, the judges became not too, and a chief with other juricic of the Common Pleas, was thereupon appointed; with jurisdiction to hear and determine all pleas of land, and injuries merely civil between one subject and another. The "aula regia" being thus deprived of its considerable a branch of its jurisdiction, and the power of the chief juricic being also considerably curbed by many articles in the Great Charter, the authority of both began to decline apace under the long and troublesome reign of king Henry III. In pursuance of this example, the other several offices of the chief juricic were, under Edward I. (who new modelled the whole frame of our judicial polity), subdivided and broken into distinct courts of judicature. Blackf. Com. vol. i. p. 38-40. De Lohn in the Constitution of England, p. 14. See the articles Court of Common Pleas, of Exchequer, and of King's Bench, &c. &c.

AUL, in Geography. See AULS.

AULA, in Ancient Geography, a place of Peloponnesus, in Arcadia, where was a temple dedicated to the god Pan.

AULADIS, a town of Aes, in Megapotamia. Plut.)

AULIE, a part of Aes, in Cilicia, between Tarsus and Anchialae. Simias.

AULI S MANIA, the walls of Auleis, a maritime place of Thrace, upon the Euxine sea, not far from Apollonia, and at some distance north from Salmydonis.

AULANA, a town of Pailecini, 30 stadia distant from Jordanas, Hecaleppus.

AULAS, in Geography, a town of France, in the department of the Gard, and chief place of a canton in the district of Le Vigan, near Le Vigan.

AULAX,
AULAX, in Flor. See Protea.

AULICER. See Aulicester.

AULENDORF, in Geography, a town of Germany, in the circle of Swabia, and barony belonging to the family of Königsegg, seated on a hill near the Hohen, eight miles north of Rauenburg. N. lat. 57° 46'. E. long. 9° 35'.

AULEN SINS, in Ancient Geography, a gulf of Thrasos, near Byzantium.

AULÉRUCI, Branchovices, a people subject to the Adiabani, who are supposed to have inhabited that part of Gaul, where is now the canton called Brieinom, near the Loire, in the diocese of Magon.—A. Chermomani, a people who inhabited that part of Gaul which now forms the diocese of Mans.—A. Eburiales, a people who occupied the country which is now the diocese of Lyon: their capital was Mediolanum.

AULÉTES, sester, in Antiquity, denotes a flute-player. One of the Ptolemies, king of Egypt, father of Cleopatra, bore the surname or denomination of Auletes.

AULÉTTA, in Geography, a town of Italy, in the kingdom of Naples, and province of Principato Citera, four miles N.W. from Cagnano.

AULI, in Ancient Geography, a people of Europe, in Macedonia, who occupied a town to which they gave their name.

AULIC, Aulicus, an act which a young divine maintained in some foreign universities, upon the admission of a new doctor of divinity. It is so called from the Latin aula, a hall: it being in the hall of the university that this act is usually held.

The person who presides at the disputation, is the same that is to take the doctor's cap.

Aulic, Aulus, is also an appellation given to certain officers of the emperor, who compose a superior court of council, which has an universal jurisdiction, and without appeal, over all the subjects of the empire, in all causes entered therein.

All causes relating to points of feudal right or jurisdiction, together with such as respect the territories which held of the empire in Italy, belong properly to the jurisdiction of the aulic council. This tribunal was formed upon the model of the ancient court of the palace instituted by the emperors of Germany. It depended not upon the fates of the empire, but upon the emperor; who has the right of appointing, at pleasure, all the judges of whom it is composed. Maximilian, in order to procure some compensation for the diminution of his authority, by the powers vested in the imperial chamber, prevailed upon the diet A. D. 1512, to give its consent to the establishment of the aulic council. Since that time it has been a great object of policy in the court of Vienna, to extend the jurisdiction, and support the authority of the aulic council, and to circumcise and weaken those of the imperial chamber; for which the tedious forms and dilatory proceeding of this chamber have furnished the emperor with pretext. "Lites Spira," according to the witticims of a German lawyer, "spiraunt, fed nunquam expirant." Such delays are unavoidable in a court composed of members named by fates, jealous of each other. Whereas the judges of the aulic council, depending on one manner, and being responsible to him alone, are more vigorous and decisive. Puffendorf, de Statu Imper. Germ. c. v. § 26.

The aulic council is established by the emperor, who nominates the officers; but the elector of Meutz has a right of visiting it.—It is composed of a president, who is a cardinal; a vice-chancellor presided by the elector of Meutz; and of eighteen assessors, or counsellors, nine whereof are Protestant, and nine Romanists. They are divided into two benches, one of which is occupied by the nobles, and the other by the lawyers. They hold their assemblies in the presence of the emperor; and for that reason are called "judicium imperatoris," the "emperor's judgment:" and "aulic council," because theirs follows the emperor's court, aula, and has its residence in the place were he is.—This court claves a little with the imperial chamber of Spire; as they are preventive of each other; it not being allowed to move any cause from the one to the other. Nor can the emperor himself hinder or suspend the decisions of either court; much less call any cause before himself, which has been once before them, without the consent of fates of the empire. Yet, in some cases, the same council forbad making any peremptory conclusion, without the emperor's participation; and only decretizes, "Fiat votum ad Cererem," that is, make a report hereof to the emperor in his privy-council.

AULICA, in Entomology, a species of Phalena (Bombyx) that inhabits Europe and Siberia. The anterior wings are greyish dotted with yellow; posterior ones fulvous, spotted with black. Lin. Pin. Succ.

AULICK, in Geography, a town of Germany, in the circle of Upper Saxony and bishopric of Naumburg; five miles north of Zitzewitz.

AULICUS, in Entomology, a species of Conus, marked with brown reticulated veins, and interrupted bands of the same colour. It is a native of Asia, and may be only a variety of the conus textile, being extremely variable in its colours and marks. Cewin mentions seven different kinds, with references to different figures in the works of Martini, Knorr, and Scalz: the most remarkable is the fourth variety, the shell of which is yellowish-brown instead of white, and marked reticulately with heart-shaped spots, disposed in a perpendicular direction.

Aulicus, in Entomology, a species of Cerambix (Cylindria Fab.) Thorax smooth and shining; body opake, black; wing-cases smooth; antenna short. Inhabits Europe.

AULICUS, a species of Cimex, that inhabits South America; the colour is red and black, varied, with a black band on the upper wings; lower wings black with a white line at the base. This is cimex irritatus of Thumberg, N. F. or at least a variety of it.

AULICUS, a species of Cryptocoephalus (Cylidea) found in Africa, especially at the Cape of Good Hope. It is black, with a rufous thorax, and azure-blue wing-cases. Fabricius.

AULICUS, in Zoology, a species of Culbber, having 184 abdominal plates, and sixty fulcral caudal scales. It is of a greyish colour with numerous linear white bands which bifurcate on the sides; on each side behind the head is a triangular white spot, and these almost unite at the nape. The length of this kind is about six inches, and its diameter one third of an inch. It inhabits America, and is deemed a poisonous snake.

AULIS, in Ancient Geography, a sea-port town of Boeotia, situate at the bottom of a small gulf, opposite to Chalcis of Euboea; and famous for being the place where the Grecian chiefs resolved upon the destruction of Troy. The district belonging to it, and called "Aulide," lay toward Eupirus, in that part which separated Beotia from Euboea. Diana had a temple in this territory, with a statue of white marble holding a flambeau in the hand.

AULLENE, in Geography, a town of the island of Corsica, four miles north of Talano.

AULNAGER, in Commerce. See Alnager.

AULNAY, or Aunay, in Geography, a town of France, in the department of the Calvados, and chief place of a canton in the district of Vire, 8 leagues south-west of Caen. The place contains 1620 and the canton 12,928 inhabitants.
the territory includes 1,824 kilometres and 19 communes. See AUNAY.

AULO, a Grecian long measure. See MEASURE.

AULONCENE, in Ancient Geography, a mountain of Phrygia, towards the north-east of Amanza-Cibotes.

AULON, a valley of Palestine, extending along the banks of Jordan, from Libanus to the defont of Pharan. Sceythopolis, Jericho, and Tiberias were situated in this valley. —Alfo, a town of Meffenia, upon a river of the same name, north of Electra.—Alfo, a town and port of the Macedonian sea, in the country of the Thaïlanst. Ptolemy.—Alfo, a town of Peloponnesus, in Laceda. —Alfo, another in Arcadia. —Another ancient town in the isle of Crete. —Alfo, a hill of Italy, near Tarentum, which was fertile in vines, and said by Horace not to be inferior to that of Palermum.

AULOS, in Caneology, a name by which several of the ancient writers call the julea, or as it is rather improperly named the rose-foil.

AULPS, or AUPS, in Geography, a town of France, in the department of the Var, and chief place of a canton in the district of Draguignan; 84 leagues W.N.W. of Fréjus. The place contains 2,949, and the canton 55,885 inhabitants; the territory includes 253 1/4 kilometres and seven communes.

AULT, a town of France, in the department of the Somme, and chief place of a canton in the district of Abbeville, five leagues west of Abbeville. The place contains 11,324, and the canton 10,018 inhabitants; the territory includes 150 kilometres and 19 communes.

AULUS GELLIUS, or AELLIUS, in Biography, a Roman grammarian and critic, flourished at Rome, where he was born in the second century, under the emperors Adrian and Antoninus Pius; and died in the beginning of the reign of Marcomannus Antoninus. He studied grammar and rhetoric at Rome, and philosophy at Athens, where he enjoyed the society of Byzantium, Pergamineus Protes, Hercules Atticus, and other learned personages. Having travelled through Greece, he returned to Rome, devoted himself to the study and practice of the law, and was appointed a judge. From the frequent citations of his works by writers on Roman law, it may be inferred, that he attained to considerable reputation in his profession. His "Noctes Atticae," or "Attic Nights," the only work extant, and the greatest part of which was written at Athens, furnishing an amusing occupation for many long winter evenings, is a collection of incidents, and anecdotes, historical and biographical, with critical observations and reflections on various authors and topics, originally compiled for the instruction and entertainment of his children, and rendered valuable by many fragments of ancient authors, that are not elsewhere to be found. It was edited in folio, at Rome, in 1469, by Svinhelm and Parnitz; a second edition was published in 1472, by Jenon at Venice; and in the sixteenth century were found the editions of Aldus, 8vo. at Venice, in 1521; of Paris, in folio, 1519, 1524, 1536; of Basle, 8vo. in 1526; of Paris, 8vo. in 1535, with the critical notes of H. Stephenson. Editions of a later date are those, in ufum Delphiæ, 8vo. 1681; of the Elzevirs at Amsterdam, 1651, 1800; at Leyden, cum notis variisum, 1660; by Crotonius, 4to. in 1705; and at Leipsic, in 2 vols. 8vo. by Guararius, in 1762. An elegant translation of this amusement, but frequently obscure and difficult author, with valuable notes was given in English, in 3 vols. 8vo. by Mr. Beloe, in 1795. Pref. to Beloe's translation. Fabr. Bib. Lat. i. i. c. 1. tit. p. 1. &c.

AUMA, in Geography, a town of Germany, in Upper Saxony, and circle of Neudaldt, forty-four miles S.S.W. of Leipsic, and fix E.S.E. of Neudaldt.

AUMA WENNEN, a town of Germany, in Upper Saxony, two miles S.E. of Auma.

AUMALE, a town of France, in the department of the Lower Seine, and chief place of a canton in the district of Neufchatel, nine leagues S.E. of Dieppe, and eleven N.E. of Rouen. The place contains 1,715, and the canton 7,720 inhabitants; the territory includes 1,692 kilometres, and 19 communes. N. lat. 49° 46°. E. long. 1° 38'.

AUMONE, or ALS. See ALS.

AUMONT, in Geography, a town of France, in the department of Lozère, and chief place of a canton in the district of Marrajos; five leagues north-west of Mende. The place contains 916, and the canton 5,560 inhabitants; the territory includes 259 kilometres and seven communes. AUN, a town of Peru, in the province of Segeslaut, forty-four leagues S.E. of Zareng.

AUNALASKENSIS, in Botany, a species of Orielus that inhabits the island of Oolalatchka. The length of this bird is eight inches; it is of a brown colour, with a spot under the eyes, and chin white; throat and breast ferruginous brown. Gmelin. The beak and legs are brown.

AUNAY, in Geography, a town of France, in the department of the Nievre, and chief place of a canton in the district of Chateauneuf; nine miles north of Meaulns.—Alfo, a town of France, in the department of the Lower Charente, and chief place of a canton in the district of St. Jean d'Angély; eight miles north-east of St. Jean d'Angély. The place contains 1,250, and the canton 11,810 inhabitants; the territory includes 317 kilometres, and 26 communes. See AULAY.

AUNSEL-WEIGHT, called Handsile-Weight, an ancient mode of weighing by a kind of balance, consisting of scales hinging on hooks fastened at each end of a beam or staff, which a man lifts up by his hand or forefinger, and does discover the equality or difference between the weight and the thing weighed. There being great deceit practised in these weights, they were prohibited by several statutes; and the even balance alone commanded. The word is still used in some parts of England, to signify meat sold by pausing in the hand, without putting it into the scales. See STYARD.

AUNCESTOR. A Think of Morit a. See ASSIZE.

AUNCESTREL HOMAGE. See Homage.

AUNE, in Commerce, a long measure used in France and other countries of different lengths in different places. See Ell.

AUNE, in Geography, a river of England, which runs into the sea near Plymouth.

AUNEAU, a town of France, in the department of the Eure and Loire, and chief place of a canton in the district of Chartres; four leagues east of Chartres.

AUNEUL, a town of France, in the department of the Oise, and chief place of a canton in the district of Beauvais; five miles S.S.W. of Beauvais. The place contains 1,727, and the canton 10,325 inhabitants; the territory includes 1,821 kilometres and 19 communes.

AUNGERVY, Richard, or Richard of Burgi, in Biography, an English bishop, was born at St. Edmundsbury, in Suffolk, in 1281, studied at Oxford, and became a Benedictine monk at Durham. He was tutor to prince Edward, afterwards Edward III.; and upon his accession to the throne, he was loaded with honours and prefaces, in 1323, he was consecrated bishop of Durham; in 1334, he was appointed a bishop and 1336, treasurer of England. He was himself eminently learned, and a great patron and encourager of learning. Petarch, with whom he corresponded, calls him "virum ardentis ingenii." He was a great collector of books, and possessed, it is said, more
mor books than all the bishops of England together. Not
withstanding the expense which he incurred in this way, by
employing persons to collect books for him abroad, and also
binders, illuminators, and writers in his several palaces, he
was distinguished by his charity and benevolence. He does
not seem to have competed himself merely with the possi-

AVOI, in Ornithology, a species of Recurvi-
rostra that is distinguished from two other birds of the
same genus, in being variegated only with black and white.
Linus, Gmel. &c.

The length of this bird is from eighteen to twenty inches;
it has a small body, and legs remarkably long; irides haz-
el; crown black; front of the neck, back, belly, and outer
pad of the wings white; legs blueish-black, beak black; about
three inches and a half in length, and like the rest of the
genus, slender, flexible, turning upwards towards the end,
and terminating in a point.

"This bird is common in winter on the eastern coasts of
England, particularly those of Suffolk and Norfolk; and
sometimes on the lakes of Shropshire. They are found in
great plenty in the breeding season, in the fens about Fusi-
dyke Wash in Lincolnshire, and in the fens of Cambridge-
shire. They feed on worms and insects, which they fetch
out of the mud and sand; and are sometimes observed to
wade or swim, but always close to the shore.

"They lay two eggs, which are about the size of
those of a pigeon. Pennant says they are white, tinged
with green, and marked with large black spots. In the
definition of them given by Latham it is observed, they
are of a cinereous grey, whitely marked with deep
brownish-black patches of irregular sizes and shapes,
before under markings of a dusky hue.

The avocet is far more frequent in some other parts of
Europe than in this country. Albin says, in Rome and
Venice they are common; and, according to Salero, they
are so plentiful on the coasts of Bas Poictou, that the pea-

AVOISI, in Geography, a town of Peruia, in the
province of Ardirbeitzan, eighteen leagues south-east of Tau-

AVIDOPOIS, or AVEROPOIS Weight, a kind of
weight used in England; the pound thereof contains
fifteen ounces. See Weight.

The proportion of a pound avoirdupois to a pound troy
is as 17 to 14; or the avoirdupois pound contains 7000
grains, and the Troy pound 7560.

All the larger and coarser commodities are weighed by
avoirdupois weight; as groceries, cheese, wool, lead, hops,
&c.

AVOISE, in Geography, a town of France, in the
department of the Sarte, four leagues from La Fleche.

AVOLA, or AULA, a town of Sicily, in the valley
of Noto, six miles from Noto, and sixteen from Syracuse.
This city, which formerly stood on a hill, boasted of being
the "Hybla Minor," so celebrated for its honey; but the
juifite of its claim, in common with many other cities,
cannot be easily decided. After its destruction by the
earthquake of 1693, the inhabitants rebuilt it more com-
monly in the plain, in a fertile territory, luxuriant in corn
and fruits, and principally in almonds, a considerable article
AVO

AVODE, in Ornithology, a name given by Cetti to some birds of the Volturn genus; as for example, volurrus fischeri is called by that writer avoluris Grifone; and vulurr viger, avoluris aero.

AVON, or AYRON, in the British Language, signifies a river generally; but in its present application designates only a few of the streams in Great Britain. The principal are the Warwickshire Avon, and the Wiltshire Avon. The former is sometimes called "The Upper Avon." It brings a great influx of waters from the north-west, rising on the borders of Leicestershire, and adds great beauty to the delightful territory of Warwick called, as it flows beneath the cliff on which those lofty towers are situated. It then glides through a charming country, to the celebrated spot of Stratford-on-Avon, the birth-place of our immortal Shakspere, and the repository of his boxes. Hence it traverses the great level of Warwickshire, by Eelham, having received the river Stour at Stratford, and turning to the south at Perithure, meets the Severn at the Ramilling town of Tewkesbury. Ireland's picturesque Viciss on the River.

The Wiltshire or Lower Avon derives its source from various springs in the north of Wilts, and becomes a considerable river at the ancient town of Marlborough. In this part of the country, we are informed by Etherhard, that it formed a boundary line between the West Saxons and Mercian kingdoms, and was often stained with the blood of murdered soldiers during the direful warfare between those two powers. Leaving Malmsbury, it meanders through a level tract of fine pastoral land to Great Somerford, Duntney, and Chippenham, where its stream becomes expanded by many contributory rivulets. Quitting Chippenham, its windings are numerous, from the hilly nature of the country through which it flows. Having passed the clothing towns of Malmiham and Bradford, it moves slowly through the gay city of Bath, thence passes on to Bristol, and soon afterwards unites its waters with the Severn. It is navigable for small vessels up to Bristol, and some considerable barges come up as high as Bath.

The Upper Avon, another Wiltshire river, rises among the hills near the centre of that county, and flows southward through a number of small villages to Amesbury and Salisbury, where it receives the united streams of the Wilton and the Nadder; and, running through Downton, crosses the county of Hants, and discharges itself into the British channel at Christchurch.

Another Avon rises in the north part of Glamorganshire, and running south, falls into the Severn at Aber-Avon, south-west of Neath.

Avon, or Avon Vale, a river in Merionethshire, rises among the high mountains of that county, and after passing by the small town of Dolgelly, soon discharges itself into the Irish sea at the town of Barmouth. Avon gives name to two rivers in Scotland. Britton's Beauties of Wiltshire, vol. i., and Skirres General Account of Rivers.

Avon is also the name of a river of Nova Scotia, which discharges itself into the Atlantic ocean, east of Halifax. It is navigable as far as fort Edward for vessels of 400 tons; and for vessels of 60 tons, two miles higher.

AVORTON, Fr. in Midwifery, an abortive child.

AVOSTOLA, in Geography, a river of Picquemont, which runs into the Cervo; 24 miles west of Barossa, in the Vercellios.

AVOWEE, ADVOCATUS, in Law. Avowee is the person to whom the right of advowson of any church belongs, so that he may present to it in his own name; thus called by way of distinction from those who sometimes present in another man's name, as a guardian, who presents in the name of his ward; as also from those who only have the lands to which an advowson belongs for term of life or years, by intrusion or donation. See AVOWEE, and ADVOCATE.

AVOWRY, is one where one takes a diffusire for rent, or other thing, and the other fuses replying. In which case the taker shall futures in his plea, for what cause he took it; and if he took it in his own right, he is to shew it, and to avow the taking; which is called his avowry. If he took it in the right of another, when he has avowed the cause, he is to make cognizance of the taking, as being a half or servent to him in whose right he did it. See REPLEN.

AVOYER, in Ecclesiastical Antiquity, was originally the advocate of a monastery; and in times of confusion the avoyers became captains and protectors of convents, to whom the said convents gave lands in consideration of their protection; but when those monasteries erected themselves into principalities, the avoyers became noblemen; and the title was connected with great dignity. Thus we find, that when Athos was elected to the empire, A. D. 1204, and his election was approved by pope Innocent III., who invited him to Italy to be crowned, he appointed Rodolphus, count of Hapenburg, prefect, vicar of the empire, and principal avoyer of all Upper Germany, with power to maintain the imperial rights, inspect the finances, levies tributes, tolls, and taxes, and, in a word, to represent the person of the emperor in his absence.

AUILLARTOK, in Geography, an island of Greenland, near Bear Island, about eight or ten leagues long, and very high. These two islands, which are about the same form and extent, divide the channel, in which they are situated, into two bays.

AU-PIX-ALLER, a French phrase, sometimes used among English writers, signifying, at the exct.

AUPS, in Geography. See AUPS.

AURA, in Chemistry, a certain fine and pure spirit, supposed to be found in every animal and vegetable body, but to sublimate as only to be perceptible by smell and taste. This term was much employed by the ancient alchimists, and even some of the most eminent chemists, but is now disused. It is nearly equivalent to spiritus nitricus, concerning which see the article AROMA.

AURA, in Greek 1,g,A, a species of VULTU, of brownish grey colour, with black wings, and white bill. This bird is described by authors under several different names. In Herandal, Mex, it is called tspotoplotf aura; by Williamby, uruba, tspotoplot, or aura; by Uloa, gallinazo; vultur Brani-ensis by Ray; vautour du Breil by Buffon; Turkey buzzard by Catesby; carrion-crow by Sloane; and carrion vulture by Pennant and Latham. Inhabiters Breil.

AURA, among Physiologus, an airy exhalation or vapour.

The word is derived from the Greek αέρα, gale.

AURACII, in Geography, a town of Germany, in the circle of Swabia, and county of Waldburg; nine miles E.N.E. of Warzach. Also, a river of Germahy, in Frankonia, which runs into the Rednitz; three miles south of Erlang.

AURE, in Mythology, a name given by the Romans to the nymphs of the air. They are mostly to be found in the ancient paintings of clicings; where they are represented as light and airy; generally with long robes, and flying, veils,
AURAGRO, in Entomology, a species of Phalaena (Melitaea) that inhabits Austria. The wings are brownish; pulch at the base, and broad hand in the middle, yellow. Hyber, Gmel. &c.

AURAINVILLE, in Geography, a town of France, in the department of the Meurthe, and chief place of a canton in the district of Touli; two leagues north of Touli.

AURAN, a town of Arabia, sixty miles south of Damascus.

AURANA, in Entomology, a species of Phalina (Toxrix), with brown wings, and two golden-yellow spots in each. Fabrissius. Donov. Brit. Inf.

AURANA, Laurana, or Bruna, in Geography, one of the most delightful places of Dalmatia, in the county of Zara, on a lake of the same name. It had formerly a rich convent of Benedictines, whose revenues were, about the year 1217, allotted in favour of the knights templars, by Andrew II. king of Hungary, who substituted a commander in this place. About this time the place was fortified. The suburbs are large. It continued for some time in the hands of the Turks; but, in 1684, they were dispossessed of it.

AVRANCHES, Abriantia, or Africe, or Africanae Epistium, a city of France, and principal town of a district in the department of the Channel, seated on an eminence near the river Se. Before the revolution, it was the fee of a bishop, suffragan of Rouen. Besides the cathedral, which stands on a hill, terminating abruptly, it had three parish churches, a convent, a college, a public school, and an hospital. This is a very ancient town, and, before the county of Bretagne was united to the crown of France, it was called the "Boulevard of France"; but when the Béxons made themselves masters of it, they destroyed its fortifications, in 1620. They were rebuilt in the reign of St. Louis. Here, it is said, Henry II. of England received abdication from the pope's nuncio for the murder of St. Thomas à Becket, in 1172; and the stone on which he kneaded during the ceremony is still shown to strangers; and on it is engraved a choice, in commemoration of the event. The ruins of the castle are extensive, and near it is an extent of fertile country, abounding in grain and orchards, which produce the belt cider in this part of France. The place contains 5413; and the canton 14,146 inhabitants; the territory includes 129 kilometres, and 16 communes. N. lat. 48° 41' 18". W. long. 1° 22' 38'.

AURANTIA, in Conchology, a species of Voluta, of a tapering shape, and orange colour; the first four whorls are lacerated with white; lip denticulated, and four plats on the pillar. Gmelin.

AURANTIA, a species of Patella, the shell of which is ovate, culd, citron colour, with brown waves; elevated, crowded, wrinkled dix, and white bottom. Native country unknown. Schott. n. Litt.

AURANTIA, a species of Ostrea. The shell is subro-tund, plated, and finely fructed longitudinally, with a semi-circular white band near the hinge. Native country unknown. Regem. Conch.

AURANTIA, a species of Venus, with an orbicular orange-coloured shell. This shell is two inches long, and two inches and a quarter in breadth. Its native country is unknown.

AURANTIA, in Ornithology, a species of Loxia, of an orange colour; crown black; wing and tail-feathers black, edged with orange. Gmelin.

The length of this bird is four inches and a half; bill darkly; some of the inner quill-feathers edged with white; legs pale-red. In the female, the whole of the head and fore-part of the body are white; the red dull orange. Inhabits the Isle of Bohmon.

AURANTIA, a species of Muscicapa, called by Latham orange-breasted fly-catcher, and given under the genus Muscicapa, by Buffon. The crown and tail, tinctured in parts with green; beneath white; breast and beak greenish brown; quill-feathers black, edged with russets. Gmelin. Length of this kind four iues and three quarters; bill red and broad; tail russet; legs pale. Dr. Latham informs us, in his Gen. Orn., that it frequents the skirts of woods and the fastnesses; and is perhaps a scarce species, only a single specimen of it having been brought to Europe.

AURANTIA, a species of Motacilla that inhabits the cape of Good Hope. It is brown above, beneath orange; chin whitish, varied below with black; larger wing and tail ever white; tail-feathers brown, lateral ones tipped with white. This is the orange-breasted weaver of Latham.

Length six inches.

AURANTIA, a species of Certhia, called by Latham the orange-browed creeper. It is green; beneath yellowish, breast orange; wings and tail black. Length four inches; bill black; legs dusky. Inhabits Surinam, and was first discovered by Mr. Meadman.

AURANTIA, in Zoology, a species of Rana, described by Dr. Shaw, as being of an orange-colour, with very slender body and limbs. This is a native of South America, and is of a smaller size than the European tree-frog; Rhabditis.

AURANTIA, in Botany, a species of Citrus, called by Latham the orange-browed creeper. It is green; beneath yellowish, breast orange; wings and tail black. Length four inches; bill black; legs dusky. Inhabits the Cape of Good Hope, and is probably a species of the genus Citrus, which is employed in pharmacy.

The outer yellow rind of the fruit is a grateful aromatic bitter, highly esteemed as a galenick. It is kept in the shops, dried with a gentle heat. It contains a large portion of aromatic essentail oil, which admirably increases the galenick power, and renders it highly grateful to the taste. The virtue of the orange-peel is readily extracted by proof spirit; and accordingly this is the form in which it is usually employed. The London college have ordered a simple tincture of this substance (tinctura aurantiicæ rictis), in the proportion of three ounces to a quart of proof spirit. It is also employed in several of the compound Tinctures, such as Huxham's tincture of bark, to give an agreeable flavour, and to add to the galenick virtue. A syrup of a very grateful flavour is also prepared, by distilling the requisite proportion of sugar in a strong infusion of the peel. See Citrus Aurantium.

AURANTIA, in Botany, See Citrus Aurantium.

AURANTIA, in Natural History, a species of Aschidia, of a somewhat globulo-shape, with a scarlet pouch, and covered with rough hardish dots; papilla terminal, ciliated, and rugose. This kind is described by Pallis; it inhabits the sea about the Kurile islands, adhering by its base to shells and stones; and is about the size of an orange.

AURANTIUS, the specific name assigned by Pallis to that species of Alcogium, called by Gmelin Alcogium aurantiius.

AURANTIUS, in Entomology, a species of Cimex found in China and Java. It is of an orange colour; head, anterior margin of the thorax, spots on the margin of the abdomen, and the legs, black. Stoll. Fabr. Donov. Inf. China, &c.

AURANTIUS Piceus, in Ichthyology, a name given by Niesnerberg to a fish of the Cyprinidae genus, called the aurante, and supposed to be of the species Cyprinus Gmelin; or perhaps Hoplias.
AURANTIUS, in Ornithology, a species of Falco that inhabits Surinam, the bill and legs of which are lead colour; body above dusky brown, with decussating narrow whitish lines; chin with long narrow whitish feathers; throat and breast orange; belly and tail brown, with interrupted streaks. Gmelin. This bird is about fifteen inches in length; bill three quarters of an inch long, and whitish at the base; on the throat a round white spot; lower coverts of the tail ferruginous; tail near the base lined with white; legs long, slender, with black claws.

AURANTIUS, a species of Picus or wood-peaker, about ten inches in length. It inhabits the cape of Good Hope; is of an orange colour above, with the nape, rump, and tail black. Gmelin. Bridfon calls bird picus capitis Bona Spie; and Latham the orange wood-peaker.

AURATUS, in Palaeontology, a species of Trichilius, called by Latham the orange-throated humming-bird. It is of a brown colour, with the head orange; chin and breast yellow; wings purple; tail ferruginous. Gmelin. Native place unknown.

AURATUS, a species of Turdus, of a blackish brown colour, with the chin and abdomen whitish; hack and legs orange. Gmelin. This is the white-chinned thrush of Latham; melura Jamaicensis of Bridfon; and _meri bru de Janique of Buffon._ This kind lives in the woods in Jamaica. Of this species Gmelin mentions three varieties; namely, (1.) _melura gula fulva_ (with the chin brown) that has been discovered in New Caedonia; (2.) _melura nigra_ (with the body black), a native of Surinam; and _melura Americana_ of Brid. and which, as its name implies, is an inhabitant of America.

AURARIA junco, pretio, or prettio, in Antiquity, a tax or tribute to be paid in gold. The collector of it was denominated palpeo aurarius, or chryseopedes.

AURAS, in Geography, a town of Siklin, in the principality of Breflaw, situate near the Oder; twelve miles north-west of Breflaw.

AURASIUS Mons, in Ancient Geography. See Audus.

AURATA, in Entomology, a species of _Buprestis_ of a large size, that is found in America. This kind is golden; wing-cases ferrated; thorax brassy. Fabricius, Olivier, &c.

AURATA, a species of Mutilla that inhabits New Holland. It is bluish, with a large golden spot on the abdomen. Fabricius.

AURATA, a species of Musca found in Europe. This insect is shining; thorax brassy; abdomen abrufus and golden. Fabricius, &c.

AURATA, a species of Phalena (Geometra), described by Linnaeus as a native of Europe. The wings are yellow, and without spots.

AURATA, a species of Phalena (Geometra) that inhabits Surinam; and is figured by Cramer under the name of _phalaena aurata._ The wings are fuscous, with a dot and posterior fuscous golden. Fabricius, &c.

AURATA, a species of Vespa, of small size, that is found in Sierra Leonia. The colour is black; abdomen golden and polished. Fabricius, &c.

AURATA, in Ichthyology, a species of Sparus, called in England the _lunated._ It inhabits the Mediterranean and American seas.

AURATA Elateri, Catesby's name of the fish called _Sparus chrysops_ by Gmelin.

AURATUM, in Zoology, a species of Lacerta found in the island of Jersey. When living, it is said to be of a fine golden colour, but after death its splendid colour disappears. It has a round and rather longish tail; scales rounded and glabrous; sides brownish. Gmelin. The body is round, and apparently corpulent, and the ears are concave. This is _lacerta bartarana_ of Muf. Ad. Fr.

AURATUS, in Entomology, a species of Scarabæus (Cetonia Fabr.) that inhabits Europe. This insect is golden, with a single tooth on each side of the first segment; wing-cases spotted with white. Fabricius. The colours in this species are variable. From the vent, it emits a fetid liquor when handled. Degeer calls it _scarabæus funaragris._

AURATUS, a species of Carabus, of the aperous kind; wing-cases golden and furrowed; antennae and legs rufous. Fabricius. Found in woods in Europe.

AURATUS, a species of Carambyx that inhabits America. It is green, bronzed, with a lateral depressed tooth on the thorax; antennae black, and posterior thighs blue. Gmelin. _Auratus_, a species of _Curcurius_, of a green-gold colour; antennae and dilated tip of the beak black. A native of Italy. Scopoli.

AURATUS, a species of Elater that inhabits China. The colour is green-gold; legs black. Fabricius.

AURATUS, in Ichthyology, a species of _Sparus_, that inhabits the Mediterranean and European seas, and is called in England the _lunated._ It is distinguished by having a semilunar golden spot between the eyes. Linne. Muf. Ad. Fr. This kind feeds chiefly on worms and shell-fish, the latter of which it grinds with its teeth before it swallows them. The back is greenish, sides rather pale and gilled with gold; on the upper part of the gills is a black spot, and beneath that another of purple; inside of the mouth fine red; dorsal fin extending nearly the whole length of the back; tail much forked.

AURATUS a species of _Cyprinus_, well known in England by the name of gold-fish. Authors are by no means agreed on the specific characters by which this fish ought to be distinguished; some think the trifurcated tail is a striking character of the species; but this is rather accidental, for it is sometimes found with a bifurcated tail; and the telescope _carp cyprinus baphilbimus_ of Dr. Shaw, has a trifurcated tail likewise; the anal fin is sometimes single, and sometimes double; so that the Linnaean definition in the Fauna Suec. is equally liable to objection. The specific character alligned by Bloch is taken exclusively from the brilliant, or golden red colour, by which, as he observes, this fish is distinguished from all the other species of the _carp_ or _Cyprinus_ genus.

This fish is, without dispute, the most superb creature of the many tribes at this time known. It was originally confined to a certain lake, on or near the mountain Tienking, at a small distance from the village of Tchzhang Sue in the province of Tchau-Kiang in China, from whence it was transported to other parts of the empire, and Japan; and afterwards brought to Europe. The Chinese have completely domesticated this fish, and they are now generally kept in ponds, basins, or vellts of porcelain, as ornaments in the gardens of the rich; and afford one of the few amusements the ladies are allowed to enjoy in that country by their jealous husbands. One writer has observed that the fish is no larger than a pilliard; but in this he is mistaken, for we know instances of its increasing to the size of a herring. The male is said to be of a bright red colour, from the top of the head to the middle of the body; the rest of a bright gold
gold colour, superior to the rich gilt gilding with that metal; the female white, with the tail and half the body emulating the fond silver. Du Halde observes that the red and white colours are not always the distinguishing marks of the male and female; but that the female is known by several white spots which are seen round the orifices that serve them as organs of hearing, and the male by having these spots much brighter. Gmelin, in his description of China, says, great care is necessary to preserve them; for they are extremely delicate, and liable to the least injuries of the air; a loud noise, such as that of thunder or cannons; a strong wind; a violent shaking of the vessel; or an even single touch, will oftentimes defray them. Their fish live with little nourishment; those small worms which are engendered in the water, or the earthy particles that are mixed with it, are sufficient for their food. The Chineses, however, take great care from time to time to throw to the fishes and refer- vours where they are kept, small balls of paste, which are very fond of, when diffus'd; they give them also lean pork dried in the sun, and reduced to a fine and delicate powder, and sometimes wine; the flame which these insects leave at the bottom of the vessel is a great delicacy for them, and they eagerly feed on it. In winter they are removed from the grounds or open air to a warm chamber, where they are kept generally in vessels of porcellain. During this season, they receive no nourishment; but however in the spring, when they are carried back to their former basins or rears, they sport and play with the same strength and vivacity as they did in the preceding year. In warm countries these fish multiply fast, provided care be taken to collect their spawn, which floats on the water, and which they almost entirely devour. This spawn is put into a particular kind of vessel, exposed to the sun, and preferred there until vivified by the heat; gold fish, however, seldom multiply when they are kept in cloze vases, because they are then too much confused. In order to render them fruitful, they must be put into rears of considerate depth, in some places at least, and which are continually supplied with fresh water. At certain times of the year a prodigious number of barns may be seen in the great river Yangtse-Kiang, which go thither to purchase the spawn of these fish. Towards the month of May, the neighbouring inhabitants put up the river in several places with nets and hurdles, which occupy an extent of almost nine or ten leagues, and they leave only a place in the middle sufficient for the passage of barns. The spawn of this fish, which the Chinese can distinguish at first sight, although a stranger could perceive no traces of it in the water, is stopped by these hurdles. The water mixed with spawn is then drawn up, and after it has been put into large vesseis, it is sold to the merchants, who transport it afterwards to every part of the empire. This water is sold by measure, and purchased by those who are desirous of stocking their ponds, and rivers with gold-fish.

Notwithstanding the tenderness of this fish in its native climate, it is now naturalized in England, France, Holland, several parts of Germany, and other countries of Europe. They are said to have been first introduced into Great Britain about the year 1693, but were not generally known, according to Pennant, till 1728, when a great number were brought over, and presented first to Sir Matthew Delacker, and by him cultivated round the neighbourhood of London, from whence they were distributed to most parts of the country.

"Nothing" says one writer, (Enc. Brit.) "can be more amusing than a glass bowl containing such fishes; the double refractions of the glas and water represent them, when moving, in a shifting and changeable variety of dimensions, shades, and colours; while the two mediums afflux by the concavo-convex shape of the vessel, magnify and distort them vastly; not to mention that the introduction of another element and its inhabitants into our parlor casts upon the scene an agreeable manner. Some people exhibit this sort of fish in a very fanciful way; for they cause a glass bowl to be blown with a large hollow space within, that does not communicate with it. In this cavity, they put a bird occasionally; so that you see a gold-fish or a heart-shaped fish as it were in the midst of the water, and the fishes swimming in a circle round it. The simple exhibition of the fishes is agreeable and pleasant; but in so complicated a way becomes whimsical and unnatural, and liable to the objection due to him, quod nescire captivum prodiere potest." One circumstance that has been remarked of the fish, deserves particular mention. It is laid when young, but not unfrequently of a deep black colour, and that after a time little silver specks begin to appear through the black; these increasing in size very gradually, till the black entirely disappears, the whole fish becomes of a fine and reptilate silver; from which it at times changes to red. Sometimes, however, it appears of a beautiful golden-red in the first influence.

Auratus, in Ornithology, a species of Cuculus, about seven inches in length, that inhabits the cage of Good Hope. Buffon calls this bird coucouvert dor et blanc. H. D. Old in his Pl. Enlum. coucouvert du cap de Bona Esperence. The tail is wedge-shaped; body above golden-green, beneath white; on the head five laces; wing-covers, secondary quills feathers, with those of the tail, white at the tips. By Latham, it is named in English the gilded cuckoo.

Auratus, a species of Picus or wood-pecker, called by Buffon picus Canarum floris cipri; picus regis de Canade et bis arcades dorés by Buffon; picus major altis aureis by Kalm; cuculus auratus, Linn. Syll. Nat. X.; and gold-winged woodpecker by Catley and other English writers. Forster and Gmelin describe it as being tranverseley streaked with grey and black; chin and breast black; nose red; tume white.

The length of this bird is eleven inches; bill an inch and a half long, black, and rather bent; and contrary to others of the same genus, is rounded and ridged only on the top, with the point sharp. The female differs from the male in having the crown and neck behind grey brown; the red of the bird head less vivid; greater quill feathers not spotted on the edges, and being defilitive of the black stripe on the throat. It inhabits Virginia, Canada, and other parts of North America. Alber, New Jersey, and New York, it is called by some bustax or pile, and by others high-hole; the two former, from the sound of its note, and the latter from the situation of its nest. It is almoat continually on the ground, and is not observed to climb on the trees like other birds of the same genus.

The food of this bird is chiefly insects, and berries of the red cedar; it is very fat, and in esteem for the table. Forster, in the Philosophical Transactions, informs us that it is a bird of passage in the northern parts of America, visiting the neighbourhood of Albany in April, and leaving it in September; that it lays four, five, or six eggs in hollow trees, and feeds on worms and insects. It is called by the natives uvetki-pam-nunow.

Auratus, a species of Turdus, the general colour of which is violet; back and wings golden-green; band on the inner margin of the wings, tail, and upper tail-coverts, blue. Gmelin. This beautiful bird is rather larger than tucus merula, or common black bird, and inhabits the kingdom of Whidah, in Africa. Buffon calls it le merle violet du regne de juida; and Latham the gilded thrush.

Auratus, a species of Trochilus, called by Latham the garnet-throated humming-bird. The colour is golden-green;
AUR

AURELIA. In Entomology, a term employed by naturalists, about the middle of the last century, to express that intermediate state in which all lepidopterous, and most other insects, remain for some time, between the caterpillar form and the period in which they are furnished with wings, with antennae, and other organs appertaining to the perfect insect. Aurelia and chrysalis are synonymous words, both alluding to the metallic or golden splendor of the case in which the creature, during that state, is contained. This brilliant appearance, it must be observed however, seems confined alone to insects of the papilio or butterfly tribe; and it is even peculiar only to certain kinds of those; so that the terms aurelia and chrysalis are altogether inapplicable, in a general manner, to insects in that state. Among entomologists of the higher class, these terms have been long since discarded in favour of the more expressive one pupa, which Linnaeus had adopted in their stead; a term implying that the insect, like an infant, yet remains in its swaddling clothes; and nothing can be more applicable than this comparative allusion, while the tender insect yet remains involved in the drapery of its membranaceous covering; a creature now exposed to every danger, and yet unable to defend itself from the slightest harm; in helpless infancy it must wait the more complete formation of its limbs, and new acquirement of strength, ere it can burst from thee, its tumults of youth, and appear what nature had ultimately designed it for— a mature and perfect creature. See Entomology, and Pupa.

The term aurélias is still retained by some few practical entomologists in this country; or, in other words, by those who amuse themselves with collecting and breeding insects, without regarding them scientifically; and persons engaged in this agreeable pursuit, occasionally denominate themselves Auréliens. The word chrysalis is in more general use than its precise meaning can justify; that of aurélias, as before remarked, is nearly obsolete. The current denominations of an insect in the pupa state among the French naturalists, are nympha, or nymphae, and chrysalis.

"The Aurelian" was likewise the title which Moses Harris gave to his well-known folio work on Insects: a wretched plagiarist from the beautiful etchings of Ammiral, which had been published a short time before in Holland; and in which Harris, by a frugal good fortune, not only escaped detection, but actually acquired that very celebrity as a delineator of insects, which attaches an importance to his memory in the present day.

Aurelia, in Natural History, a species of Paramecium (versus inferiores), of an elongated form, placed longitudinally on the anterior part. Mill. Herrmann, &c. Hill describes it thus: paramecium corpore fab. H. 20 medio versus angula. It is found in great abundance in ditch water, and vegetable infusions, about the month of June; it is membranaceous; breadth one-fourth of the length; anterior part obtuse, hyaline; posterior part filled with molecules of various sizes; longitudinal fold extending from the middle to the front of the head.

AURELIAN, in Biography, a Roman emperor, was a native of Sirmium, in Pannonia. His father cultivated the lands which a Roman senator, called Aurelius, possessed in the country where he lived; and his mother was a priestess of the sun, and pretended to divination. Aurelian was from his youth distinguished by his strength and courage, and devoted to military exercises and achievements. On this career he entered before; and, finding himself like a lion and lioness, he obtained, by way of distinction from another Aurelian, the name of "Aurelianus manu ad ferrum," or "Aurelian sword in hand;" as he was ready on all occasions to draw his sword, and encounter the enemy.
Aurelian, having secured the person and the provinces of Tetricus, turned his arms, A.D. 272, against Zenobia, the celebrated queen of Palmyra and the East. Upon his arrival in Asia, he advanced at the head of his legions, and took possession of Ancyra and Tarsus; and as he approached Antioch, it was deserted by the inhabitants; but by a signal edict he recalled the fugitives, and granted a general pardon to all, who, from necessity rather than choice, had been engaged in the service of the Palmyrene queen. This unexpected milder act of clemency, on the part of the emperor, conciliated the minds of the Syrians; and as far as the gates of Emesa, the wishes of the people foimd the terror of his arms. Zenobia attempted to check his further progress; but the fate of the sable was decided in two great battles: the first of which was fought near Antioch, and the second near Emesa. In both these battles, Zenobia animated the armies by her presence, but the veteran troops of Aurelian, whose valor had been severely tried in the Alamanian war, prevailed. After the defeat at Emesa, Zenobia found it impossible to collect a third army. As far as the frontier of Egypt, the nations subject to her empire had joined the standard of the conqueror, who detached Probus, the bravest of his generals, to poffefs himself of the Egyptian provinces. The queen retired within the walls of her capital, Palmyra; and for some time resisted, with the intrepidity and firmness of a heroine, the armies of the emperor, who invested the city. But disappointed of adequate succours, and alarmed by the return of Probus with his victorious troops from the conquest of Egypt, she at length resolved to fly. She mounted the fleet of her galleon, and had already reached the banks of the Euphrates, about sixty miles from Palmyra, when she was overtaken by the pursuit of Aurelian's light war vessels, and was brought back a captive to the feet of the emperor, A.D. 273. To the coniuls of her friends she imputed the guilt of her obbligation to the empire, and on their heads, and particularly on the celebrated Longus, she directed the vengeance of the crown Aurelian. (See Zenobia.) Soon after her capital surrendered, and was treated with clemency. By a war thus terminated, those provinces that had renounced their allegiance to the empire of Valeria, were restored to the dominion of Rome. Aurelian, on his return, received the dominion of the East, but already crossed the straits which divided Europe from Asia, when he was suddenly recalled by the news of the revolt of the Palmyrenians, who had murdered the governor and garrison, and proclaimed a new emperor. Without...
Aurelian, having thus completely reduced Palmyra, and having also suppressed a rebellion in Egypt, excited by Firmus, a wealthy merchant, and a friend and ally of Odenathus and Zenobia, who had taken possession of Alexandria, and assumed the purple, and whom he first tortured and then put to death; returned to Rome; congratulating the senate, himself, and the people, that in little less than three years he had restored universal peace and order to the Roman world.

Since the foundation of Rome, no general had more nobly deserved a triumph than Aurelian; nor was any triumph ever celebrated with superior pride and magnificence. It is thus described by Gibbon: "The pomp was opened by twenty elephants, four royal tigers, and above two hundred of the most curious animals from every climate of the North, the East, and the South. They were followed by 1500 gladiators, devoted to the cruel amusement of the amphitheatre. The wealth of Asia, the arms and ensigns of so many conquered nations, and the magnificent plate and wardrobe of the Syrian queen, were disposed in exact symmetry or artful disorder. The ambassadors of the most remote parts of the earth, of Ethiopia, Arabia, Persea, Bactriana, India, and China, all remarkable by their rich or fantastic dwarfs, displayed the fame and power of the Roman emperor, who exposed likewise to the public view the presents he had received, and particularly a great number of crowns of gold, the offerings of grateful cities. The victories of Aurelian were attended by the long train of captives who reluctantly attended his triumph; Goths, Vandals, Sarmatians, Alemani, Franks, Gauls, Syrians, and Egyptians. Each person was distinguished by its peculiar insignia; and the title of Amazon was bestowed on ten maternal heroines of the Gothic nation, who had been taken in arms. But every eye, disregarding the crowd of captives, was fixed on the emperor Tetricus, and the queen of the East. The former, as well as his son, whom he had created Augustus, was decked in Gallic troupers, a saffron tunic, and a robe of purple. The beautiful figure of Zenobia was confined by fetters of gold; a diadem supported the gold chain which encircled her neck, and the almost fainting under the intolerable weight of jewels. She preceded on foot the magnificent chariot, in which the once hoped to enter the gates of Rome. It was followed by two other chariots, filled more pompously, of Odenathus, and of the Persian monarch. The triumphal car of Aurelian (it had formerly been used by a Gothic king) was drawn, on this memorable occasion, either by four flags or by four elephants. The most illustrious of the senate, the people, and the army, closed the solemn procession. Unsignified joy, wonder, and gratitude, swelled the acclamations of the multitude; but the satisfaction of the senate was clouded by the appearance of Tetricus; nor could they suppress a rising murmur, that the haughty emperor should thus expose to public ignominy the perfidy of a Roman and a magistrato."

But, however, in the treatment of his unfortunate rivals, Aurelian might indulge his pride, he behaved towards them with a generous clemency, which was seldom exercised by the ancient conquerors. Princes, who, without success, had defended their throne or freedom, were frequently strangled in prison, as soon as the triumphal pomp ascended the Capitol. These usurpers, whom their defeat had convicted of the crime of treason, were permitted to spend their lives in an honourable retirement. The emperor prefeted Zenobia with an elegant residence in Tiberius, or Tivoli, about twenty miles from the capital: the Syrian queen infamously fink into a Roman matron, her daughters married into noble families, and her race was not yet extinct in the fifth century. Tetricus and his sons were re-inflated in their rank and fortunes. They erected on the Celian hill a magnificent palace, and as soon as it was finished, invited Aurelian to supper. On his entrance, he was agreeably surprised with a picture which represented their filigree history. They were dedicated offering to the emperor a civic crown and the sceptre of Gaul, and again receiving at his hands the ornaments of the senatorial dignity. The father was afterwards invested with the government of Lucania; and Aurelian, who soon admitted the abdicated monarch to his friendship and conversation, familiarly asked him, whether it were not more desirable to administer a province of Italy, than to reign beyond the Alps? The question continued a respectable member of the Senate; nor was there any one of the Roman nobility more esteemed by Aurelian, as well as by his successors.

"The festival was protracted by theatrical representations, the games of the circus, the hunting of wild beasts, combats of gladiators, and naval engagements. Liberal donations were distributed to the army and people; and several institutions, agreeable or beneficial to the city, contributed to perpetuate the glory of Aurelian. A considerable portion of his oriental spoils was consecrated to the gods of Rome; the Capitol, and every other temple, glittered with the offerings of his obsequious piety; and the temple of the gods alone received above 15,000 pounds of gold."

The arms of Aurelian vaunted the foreign and domestic fees of the republic; and we are assured, that by his salutary rigour, crimes and factions, mischievous arts and pernicious connivance, the luxurious growth of a feeble and oppressive government, were eradicated through the Roman world. Nevertheless, a few short intervals of peace were insufficient for the arduous work of reformation; and even his attempt to restore the integrity of the coin was opposed by a formidable insurrection, which originated with the workmen of the mint, and terminated by a bloody battle, in which the emperor lost 7000 of his troops. Of this insurrection, the real cause was disguised, and the reformation of the coin furnished merely a signal pretence to a party already prepared for a revolution. The emperor, who was himself a plebeian, and who always expressed a peculiar fondness for this order, had excited the jealousy, and incurred the hatred and suspicion of the senate, the equestrian order, and the Praetorian guards; and it was a conspiracy of these several orders that procured a breach capable of containing a party already prepared for revolution. The emperor was assassinated, in 275, at the age of 40, at a distance of five years from his death. He was succeeded by his son, who was named Aurelius, but who died in the following year. The empire was divided between his sons, and the civil war continued for a considerable time."

Some of the concluding months of Aurelian's reign were occupied...
occupied by a visit to Gaul, where he rebuilt the ancient city of Génoh, called after his own name "Aurelium," now Orleans, and by an expedition against the barbarians who had made an incursion into Visigothic. But the object, which engaged his principal attention, was an expedition against Peitha; in the prosecution of which he advanced as far as the Iberian which divide Europe from Asia. Here a conspiracy was formed against his life by one of his secretaries, who was accused of extortion. This criminal, dreadizing the effects of the emperor's displeasure, determined to involve some of the principal officers of the army in his danger, or at least in his fears. With this view he artfully counterfeited his master's hand, and slewed them in a long and bloody list their own names devoted to death. Without inspecting or examining the fraud, they resolved to secure their lives by the murder of the emperor. On his march, between Byantium and Heraclea, Aurelian was suddenly attacked by the conspirators, and after a short refinance, fell by the hand of Mucapor, a general whom he had always loved and trusted. Accordingly he died, A.D. 275, regretted by the army, detested by the senate, but universally acknowledged as a warlike and fortunate prince, the useful, though fever, reformer of a degenerate flat.

As to his general disposition and character, it has been observed by Didierian, that the only fagacious of the Roman princes, that the talents of his predecessor Aurelian were better suited to the command of an army, than to the government of an empire. His temper was haughty and vindictive. Trained from his youth in the exercises of arms, he transferred the discipline of the camp into the civil administration of the laws; and his love of justice often became a blind and furious passion. Ignotor or impotent of the restraints of civil institutions, he disdained to hold his power by any other title than that of the sword, and governed by right of conquest an empire which he had saved and fubdued. Aurelian has been reckoned by several Christian historians among the persecutors of the church; and it is said that he not only increased persecution and framed cruel edicts for this purpose just before his death, but did actually persecute. His persecution, however, reckoned by Augustine the ninth, was short; as he died soon after the publication of his edicts, and before they could reach the more distant provinces. Mohein is of opinion that many Christians did not suffer at this time; but considering Aurelian's cruel temper, and how much he was addicted to the Gentile superstitions, he thinks that if he had lived, his persecution would have exceeded all the former persecutions in severity.

AURELLAN, in Botany. See Panax.

Aureliopolis, in Ancient Geography, an episcopal city of Aisamor, in Lydia. — Auto, another episcopal city of Aisamor, in Aisamor properly so called.

AURELIUS, Ambrosius. See Ambrosius.

Aurelius, Marcus. See Antonius.

Aurelius Victor, Sextus, in Biography, a Roman historian, flourished in the 4th century, probably from the reign of Constans to that of Theodosius; was born of mean and illiterate parents, perhaps in Africa, and notwithstanding the obscurity of his origin, was advanced by his talents to distinction. In 361, he was appointed by Julian, prefect of the second Pannonia; afterwards prefect of Rome; and in 369, consul with Valentinian. The abridgment of the Roman history, intitled "Libellus de origine Gentis Romanae," and by some ascribed to Aurelius Pedanius, though it bears the names of Victor and Livius, professes a history of the whole period, from the uncertain time of Janus and Saturn to the 12th consilium of Constantius, but really closes in the first year of the city. This treatise was published, together with the works of Dionysius Halicarnassus, by George, in 1505; and with a collection of ancient historians, by Gathofes, in 1840. At Lyons, in 1546.

The biographical treatise under the title "De Viris Illustribus Urbis Romae," received by many as the work of Aurelius Victor, commences with Probus king of the Alani, and terminates with Pompey; it was published in 410, with notes, by Machamerus, in 1556, and with those of Lycellhens, in folio, at Balil, in 1561. "The History of the Caesars from Augustus to Constantius," the unquestionable production of Victor, was first published by Schurrs at Strasbourg, in Svo., in 1555; at Venice, by Aldus, in 1507; by Schottus, at Antwerp, in 1579, in Svo.; and at Balil, in folio, in 1546, with Quintus and other Augustan writers. The first general edition of all the writings of Aurelius Victor was printed at Antwerp, in 410, with the commentary of Schottus, in 1555, by Plantin, and in 1571, again by Gruter, at Hanovia, in the 2d volume of the "Historia Augustae Scriptorum," in folio, in 1610. An enlarged edition, with heads, "cum notis variisurum," was printed in 410, in 1571; another by Pietius, at Utrecht, in Svo. 1676; and a third by Arthusius, in 410. At Amsterdam, in 1673.

Aurelius Victor is reckoned an industrious and faithful historian, but his style is much less elegant than that of the earlier writers of the Roman history. Fabr. Bibl. Lat. i. iii. c. 9. 1. 2. p. 79. &c. See Augusta Historia.

Aurelius, in Entomology, a species of Papilio that inhabits India. The wings are brown, black at the tip, and spotted with white; two eye-shaped spots on the posterior ones beneath. Fabricius, &c.

Aurelius, in Geography, a military township of New York, in Onondago county, on the Oentral lake, having the Cayuga reservation lands on the west, and Marcellus to the east, nine miles east of the ferry on the Cayuga lake. By the late census of 1796, 123 of the inhabitants are electors.

Aurella, in Entomology, a species of Phalana (Tinea), wings golden, posterior ones black, with a stripe of silver on the first pair. A minute insect that inhabits Europe, and feeds on apple-trees.

Aureng-Zeb, Aureng-Zeb, or Aurung-Zeb, denoting "Ornament of the throne," in Biography, the great mogul, was the third son of Shah Jehan, and born in the year 1618. His disposition was ferous and thoughtful; and in order to prevent jealousy and suspicion, he laminated the authority of a religious mendicant. Dara, however, his elder brother, discovered his real character through this disguise; and as he had contrived to gain the cheel and confidence of his father, Dara used to lay of him, "I fear none of all my brothers but this teller of heads!" Shah Jehan, who thought it most prudent and safe to remove all his foes from court, sent Aureng-Zeb to govern the Deccan, where he made an unsuccessful attempt against the king of Golconda. Towards the close of the year, 1656, Dara, endeavouring to gain possession of the empire, confined his father Shah Jehan; upon which Aureng-Zeb began to make preparations, and with the professed design of securing the throne to his brother Morad, who was then at Akmedabad, requested that he would join him with his forces at Eugene, the capital of the province of Malav. In the beginning of the year 1658, he marched from
from Aurungzeb to the Deccan, and the two brothers joined at Agra, near which place they encountered and defeated the troops which Dara had sent to oppose them. They afterwards marched towards Delhi; and in the fields of Kojouil, near Agra, obtained a complete victory over Dara and his army; so that Dara himself fled towards Latur, and Aurung-Zobe entered the castle of Agra. After this victory he took possession of the throne, July 20, A.D. 1658, and was proclaimed emperor at the town of Ernabah, about six miles from Delhi. On the 13th of May 1659, he was proclaimed a second time, and he then issued a decree, that on the first the beginning of his reign should be dated from the 1st Ramazan, in the year 1659 of the Hegira, or the 12th of May 1659. For the security of his throne, he confined his father at Agra; and his brother Morad, in violation of the solemn oath of fidelity, he imprisoned in a fortress near Delhi, where he was afterwards beheaded. During the civil war which commenced at the time of his accession to the throne, and which was continued till his power was completely established, his brother Shah was first defeated at a place called Kuvra, in the province of Bengal, and compelled to fly; but being concerned in a plot for detaining him, he was put to death, and his whole family was extirpated. Dara was taken prisoner, and brought in triumph to Delhi, and sent from thence to Kherabad, a place at the distance of about 118 miles, where he was murdered by Aurung-Zobe's order, Augstul 28th, 1659. In 1660, Aurung-Zobe confirmed his own son Mahommed, and the son of Dara, in the castle of Gualiar, where the former died, as some say, in consequence of confinement, and the latter was d-e, at have by poison. Aurung-Zobe, after his accession to the throne, found some difficulty in perfuading the chief cadi to acknowledge his sovereignty, because the old king, Shah Jehan, was still living. But another cadi being appointed in his room, the ceremonial of coronation was performed, and Aurung-Zobe obtained undisputed and peaceable possession of the throne. The recollection, however, of the crimes by which he had gained the sovereignty, was an occasion of remorse; and in order to quiet his mind, he imposed upon himself a rigorous penance; eating only barley bread, herbs, and fruits, and drinking nothing but water. This abstinence, diet brought on an illness, which endanged his life; and during the agitation which ensued at court, he had an opportunity of displaying that resolution and firmness of mind for which he was always distinguished. Although he had deposed his father, his behaviour to him was respectful and submissive, that he at length obtained, before his death in 1666, his forgiveness and general blessing. When Aurung-Zobe became emperor, he assumed the titles of "Mohy o'dhu," i.e. the reviver of religion; and "Alaungquir," or the conqueror of the world, of which his ignorance and vanity led him to believe that he possessed three parts in four.

From the year 1660 until the year 1678, there prevailed, through Hindostan in general, the most profound peace that had ever perhaps been known; but Aurung-Zobe disdained to have any other boundary on the south besides the ocean. Accordingly, the conquests of the remote part of the Deccan employed a very considerable part of his leisure, during the latter part of his reign, when the whole of that region, with the peninsula, was annexed, and inaccessible tracts excepted, was either entirely subdued, or rendered tributary to the throne of Delhi. Aurung-Zobe was particularly desirous of subduing the Deccan, by the determined spirit and growing power of Bavarje, the founder of the Maharattas, who, by his conquests in Visapour, appeared under the character of his rival. Soon after he had quelled his personal preheme a rebellion of the Patans beyond the Indus, in 1678, his persecution of the Hindus stirred up the Rajpoot tribes in Agimore. This war he also undertook in person; but he and his whole army were shut up between the mountains, and the empress herself was taken prisoner. She, however, and also the emperor, were permitted to escape. This diftper did not discourage him from carrying the war into the Rajpoot country again, in 1681; when he took and destroyed Chistore, the famous capital of the Rana, as well as all the objects of Hindoo worship which he found in this place. Nevertheless the spirits of these gallant people were still lambi, and Aurung-Zobe was under a necessity of gaining them peace. In Mr. O'ree's "Historical Fragments of the Mogul Empire," we have a letter written by Jefavom Singrijah of Jondypou, to Aurung-Zobe, expatiating with him on the amiable measures he was pursuing with respect to the Hindoos. This letter breathes the most admirable spirit of philanthropy, and of toleration in matters of religion, together with the most determined resolution to oppose the meditated attack on the civil and religious rights of the Hindoos. While Aurung-Zobe was engaged in his contests with the Rajpoots, confining of several of the most warlike tribes among the Indians, his son Sultan Mahommed Akbar, revolted from him, and joined them; but he was pursuued by the emperor to Deccan, from whence he found means for escaping to Peria. In the year 1682, upon the death of Sevajee, the rising state of the Maharattas devolved on his son Bambyees, who was afterwards betrayed into the hands of Aurung-Zobe, and barbarously put to death. Still, however, the mountainous parts of Baghiana were unsubdued, and although the kingdom of Vifapour was reduced in 1686, and Golconda in the following year, he found it very difficult to prosecute his conquests towards the west, as we may infer from his camp's being fixed on the Kifra river, about 200 miles to the north-east of Goa, in 1695. But we have no regular history of any later period than the 56th year of Aurung-Zobe, or the year 1670, when Mr. Dow's history terminates. It is said, that Aurung-Zobe was employed in the Deccan from the year 1678 to the time of his death, and was actually in the field during the greatest part of the last fifteen years of his life. This description of his original empire and capital for nearly thirty years, was the occasion of various disorders. To this circumstance were owing the second rebellion of the Rajpoots in Agimore, that of the Patans towards the Indus, and also that of the Ietas, or Iates, in the province of Jorjagh. Besides the conquests of Vifapour, Golconda, and the Carnatic, to the south; and those in the kingdom of Afam to the north, Aurung-Zobe reduced Bengal, and reduced the mouths of the Ganges from the Portuguese pirates, who had long infested them. Under his reign the empire attained its full measure of extent. His authority reached from the 10th to the 35th degree of latitude, and nearly as much in longitude; and his revenue, says major Rennell, exceeded thirty-two millions of pounds sterling, in a country where the products of the earth are about four times as cheap as in England. Prior estimates the whole revenue of the empire from 21 fowas, or provinces, at 12,071,875,680 duns, which at 320 duns to a pound sterling, amounted to 37,724,615/. 25. 6d. Such an idea was the reputation for power and wealth which Aurung-Zobe acquired, that embassies were sent to him from all the neighbouring nations, as well as from the European powers, who wished to obtain commercial advantages in his dominions. But under an apprehension of the designs of his foes both against himself and against each other, he was obliged to tax most of his time
in his camp, which formed a kind of moving city. It is
described by the curious traveller Bernier, who followed it
from Delhi to Cathmim. The guard of cavalry consisted of
35,000 men, that of infantry of 10,000. The number of
horses, mules, and elephants, was computed at 150,000; of
camels and oxen at 50,000 each; and of perfumes between
300,000 and 400,000. Almost all Delhi followed the court,
while magnificence supported the industry of its traders and
artisans.

Aureng-Zebe fixed his residence, when in winter-quarters,
at Ahmednagar in the Deccan; and here he died, February
214, 1707, in the 90th year of his age. According
to the directions of his will, he was buried in the cell of a holy
dervise near this city; and as he professed great zeal for
Mahometanism, the votaries of this religion deem it a mer-
itorious pilgrimage to visit his tomb, particularly on the
28th of the month Zecadsab, the day on which he died.
Aureng-Zebe foreflew the contests that would arise between his sons for
the empire; and it has been asserted that he made a partition
of it among them. His will expressly intimates, that
he had made a division among his children, for preventing
confusion and bloodshed; and he says, that as there were
two imperial feats, Agra and Delhi, whoever settled in
Agra might have the provinces thereof, Deccan, Malwa,
and Guzerat; and he who resided at Delhi, might have
Caulb and the other provinces. Nevertheless, two letters,
written by Aureng-Zebe to two of his sons a few days be-
fore his death, cited by major Renell, indicate no intention
of dividing the empire, but express in doubtful terms his ap-
prehension of a civil war. These letters furnish this striking
lemon to real mortality, that however men may forget
themselves during the tide of prosperity, a day of recollec-
tion will inevitably come sooner or later. Here we
are presented with the dying confession of an aged monarch,
who made his way to the throne by the murder of his bro-
then, and the imprisonment of his father, and who, after
being in peaceable possession of it, percutted the most in-
offensive part of his subjects, either through bigotry or hy-
ponasty. Here we behold him in the act of resigning that,
to obtain possession of which he incurred his guilt; and pre-
ferred to us as a mere deluded man, trembling on the verge of
eternity; equally deplozing the past, and dreading the fu-
ture. How awful must his situation appear to him, when
he says, wherever I look, I see nothing but the Divinity.

Aureng-Zebe left four sons: Mauzum, afterwards em-
peror, under the title of Bahader Shah; Azem, and
Kaum Bukhsh, who severally contested the empire with their
elder brother; and Akbar, who had rebelled against his
father, and fled to Persia. The death of their father was
the signal of hostility between Mauzum and Azem; the
former approached from Cabul, and the latter from the
Deccan, and disputed the possession of the whole empire
(for Azem had proposed a partition of it), with armies of
about 300,000 men each. Near Agra it was decided by a
battle, and the death of Azem. Mauzum was pro-
claimed emperor, and reigned between five and six years.
In the course of fifty years after the death of Aureng-Zebe,
a succession of weak princes and wicked ministers annih-
iliated the extensive and mighty empire which he had elab-
oblised.

Aureng-Zebe possessed many talents which qualified him

for governing a large empire. He was sober, averse,
and resolved, and though he was not ferocious as to the means
by which he acquired power, he was generally mild in the
exercise of it; but he allowed his subordinate governors
and omans to oppress the people with impunity. In the ob-
serverance of the outward ceremonies of religion, he was ri-
gidly exact; and his zeal for making profits, whatever
were the views in which it originated, led him to adopt
measures of violence and persecution. In his deeds, he was
plain; in his mode of living, abhorrent; in his ordinary
occupations, when his military enterprises afforded him
intervals of leisure, he could descend to employ himself in
making caps, which he distributed among the great lords of
his court. The traveller Gemelli Carreri, who saw him in
1695, gives the following description of his person.
"He was of a low stature, with a large nose, a white beard,
and olive complexion. He was slender, and stooping with age,
and supported himself on a staff; yet he adorned petitions
without spectacles, and by his cheerful countenance seemed
pleased with doing business at a public audience." Frazer's
of a Man of Hindoostan, introd. p. 61—64. Modern Hist.
vol. v. p. 426—442.

AUREOLA, the crown of glory, given by painters and
statuaries to saints, martyrs, and confessors, as a mark of the
victory which they have obtained.

F. Sirmond says, this custom was borrowed from the
heathens, who used to encompass the heads of their deities
with such rays.

AUREOLARIA, in Entomology, a species of Phala-
nax (Gramma) of a small size, that inhabits Germany.
The wings are deep yellow, with three streaks and the mar-
gins brown. Fabricius.

AUREOLUS, Manius Aciarius, in Biography, a na-
tive of Dacia, was advanced from the humble occupation
of a shepherd, by enlisting in the Roman army, to the com-
mand of a body of cavalry, and distinguished himself by the ser-
vice he performed to the emperor Gallician, in a battle
against the rebel Ingenious. Whilst he commanded in Illy-
ricum, he defeated Macrianus, who assumed the purple, and
continued to maintain a partial attachment to Gallicius.
At length, A.D. 263, a considerable army, stationed on
the Upper Danube, invested with the imperial purple their leader
Aureolus; who, dreading a combined and barren reign over the
mountains of Thracia, passed the Alps, occupied Milan,
threatened Rome, and challenged Gallicius to dispute in the
field the sovereignty of Italy. "Defeated by the emperor in
a battle near Milan, Aureolus retired into the city; and dur-
ing the siege, he contrived to form a conspiracy in the be-

Aureolus, in Entomology, a species of Scarabaeus,
a depressed and somewhat angulated shape, and powdered
with gold: thorax and shells dotted with black. Inhabits
Dauria. Pallus.

Aureolus Pont, now Pontirolo, in Geography, a
bridge of Italy over the Adige, 13 miles from Bergano, and
32 from Milan, near which the usurper Aureolus was de-
feated by the army of the emperor Gallicius. Near this
place, in 1703, the obstinate battle of Caffano was fought
between the French and the Austrians.

AURESS, AUREZ, or EURES, Jibeal, the same given

Vol. III.
to the mons Aurosus of the middle age, and the mons Aureus of Ptolemy, being a part of the Atlas, extending southward from Icaria, quite to Bithynia. See Auros.

AURETTE, a river of France, which runs into the Eure, near Bourges.

AUREUS, in Entomology, a species of Staphylinus, that inhabits Spain. The head, thorax, and wing-cases, are covered with yellowish or golden down; abdomen black, fuscated with ash-colour. Fabricius, &c.

AUREUS, Mons, in Geography, a mountain of Media Prima, near the Danube. And also, a town of the same name at the foot of it on the same river. Also, a mountain of the northern part of the island of Corfu, the ridge of which runs out to the north-east and south-east, and forms a kind of elbow. The emperor Probus planted vines on this mountain. Ptolemy.

AUREUS, in Ichthyology, a very splendid species of Che! todon, figured and described by Bloch in his History of Fishes, under the title of C. aureus, and la bandoulere doree. This author acquaints us, that he found the drawing of this species amongst the designs of Father Pluemer, and that it inhabits the Antilles, but of its history he is entirely ignorant.

The body is of an oval form, golden-yellow colour, and covered with hard denticulated scales; the mouth is small, lips strong, and jaws furnished with falcatec teeth; gill-cover of a single piece; lateral line rather arched; fin yellow, green at the end; pectoral and tail fin rounded, the others filed; in the dorsal fin twelve rays. It is specifically distinguished by being of a golden colour, and having a spine near the cheek bone. Gmelin, Bloch, &c.

AUREUS, in Natural History, a species of Limax, that inhabits trees in Denmark and Norway, and described by Mili. as being yellow, and without spots. This creature is an inch and a half in length; beneath white, feelers, and a line between them, black.

AUREUS, in Ornithology, a species of Oriolus in the Linnean system, and Paradise bird in that of Latham. A bird that is supposed to inhabit New Guinea. General color tymew yellow, with the frontlet, chin, edges of the wings, and tail black. Oif. The length of this bird is eight inches; bill an inch long, and rather bent; shafts of the tail feathers, and fringe, near the tip yellow. This is the golden paradise bird of Latham; le troupeau des Indes of Buffon; and le rolier de paradis of Buffon.

AUREUS, a species of Psittacus, that inhabits Brazil, and is called by English naturalists the golden-crowned parakeet. This kind is green, with the cere and orbit blue-yellow; eye colour; crown golden; an oblique blue band on the wing-coverts. Gmelin. Briff. calls it psittaca Brasiliensis; and Buff. Perruche couronne d'or.

AUREUS, in Zoology, the species of Canis usually called the Jackal; an animal about the size of a middling dog, and specifically distinguished by having a short tail, and body pale fulvous. Schreber Saugth. —Gmel. &c. Kampf er calls it lupus aureus; Valant. vulpes Indiae Orientalis; Briff. adi; Buffon, chel, adze; Vosmier, chien sauvage Indien; and Gmel. and Penn. schakal, &c.

This animal inhabits the warmer parts of Asia and Africa, lurking among the woods and mountains in the day-time, and venturing out in search of prey only during the night; when they assemble together in herds to the amount of two or three hundred, and indiscriminately attack and devour the lesser kinds of animals and birds; and will occasionally eat also certain kinds of vegetable. The voice of the jackal is described as peculiarly hideous, confounding of a kind of howling and indescribably barking; and when they hunt in troops, by their dreadful yells alarming and put to flight deer, antelopes, and other timid quadrupeds; while the lion, intrenchively attending to the clamour, is said to follow till the jackals have hunted down the prey, and having satisfied himself, leaves only the mangled remains to be devoured by the jackals. It is for this reason, Dr. Shaw observes, that the jackals is popularly termed the lion’s provider. When prowled by hunger, jackals have been frequently known to enter towns, and devour indiscriminately whatever animal substance they can find. They commit ravages among the flocks, kill fowls, &c. and have been known to attack mankind.

There is great reason, according to Dr. Shaw, for supposing this animal to be the real origin of the dog, since almost all its manners and propensities are the same. When taken young, it is easily tamed; attaches itself to mankind, distinguishes its master, comes on being called by its name, shews an attachment to dogs instead of flying from them, and has all the other peculiarities of character by which the dog is distinguished; amongst others, the important observation of professor Goldenstadt, who has given an accurate description of the jackal in the Peterburg Transactions, should by no means be omitted, viz. that the jackal and dog agree in the structure of the cocum or short intestine, and differ in that respect both from the wolf and the fox.

Dr. Pallas has favoured the world, with an accurate description of this animal. In external figure, he remarks, the jackal resembles the wolf more than the fox. It is also larger and stands higher on its legs than the fox. The head is of a fox-red colour above, mixed with ash-grey hairs, which have each a blackish ring and tip; the upper lip is white on each side of the nose, and the throat is of the same colour; the whiskers, the long hairs on the chin, and those above the eyes, which are five in number, are black; the ears are fox-red externally, and white internally; the neck and back are all over grey-yellow, and both, and especially the latter, are dished with a shade of duney, owing to the tips of the long hairs on those parts; the under part of the body, and the legs, are of a light reddish yellow, but the shoulders and thighs are externally of a fox-red; the claws are black; the thumb claw stands higher than that of the dog, and is crooked; the tail is straight, somewhat longer and more hairy than in the wolf, and is of a greyish-yellow, more inclining to fox-red towards the end; the long hairs have black tips, and consequently the tip of the tail appears black; the hair of the jackal is coarser and stronger than that of the wolf, and is longest on the shoulders and tail, where it measures four inches; on the neck and back it is shorter by an inch; between the hairs is situated a woolly fur of a grey colour; the four middle front teeth are of a truncated form, or, as if cut off, flat, not perceptibly notched or indented; the two exterior larger ones in the upper jaw are somewhat larger than the under; the grinders are six on each side, the first being the smallest, and of a conical shape; the next grinders, to the number of two in the upper, and three in the lower, are gradually larger, and divided into three points; the fourth of the upper jaw and the fifth of the under are the largest, and have two points; the remaining ones stand deeper in the jaw or more inwards, and are smaller than the preceding; the tongue has, on each side, a border or row of small verrucous or warts.

Mr. Pennant describes the usual length of the jackal to be about two feet and a half; the female rather smaller than the male, and with from six to eight paps. Dr. Pallas counted in a young jackal three teats on one side, and four on the other.
on the other, of which the foremost one was situated near the side of the breast.

The more we consider the nature and manners of this animal, says Dr. Shaw, the more reason we shall find to coincide with professor Goldschmidt in opinion, that the jackal is the real origin of the dog (nimbly, indeed, we allow the wild dogs of Africa to be the dog in a state of nature). M. Goldschmidt very properly observes, that the natural skin of the wolf does not seem to fit it for the supposed origin of the dog; since it is generally confined to the frigid zone; its hair is also against the supposition; for the natural law of any species of animal appears to be between that of the large and small species. The fox is still more unlike the dog, as to some particulars, in the structure of the tail; the latter country of the jackal, which is properly Asia Minor, is inhabited where we should naturally suppose the primaeval domestic dog to have originated. The jackal, according to M. Goldschmidt, has a natural propensity to follow mankind, instead of flying from him, like the wolf and the fox.

The whip, he adds, is very readily tamed, and when grown up, assumes all the habits of the domestic dog. That the jackal and dog readily intermix, appears from various testimonies, according to Buffon. M. Goldschmidt cannot consider the reconstituted tail as a specific character of the dog, but it may be considered from evaporation. The general colour of the jackals, which this author has seen, is a dirty fulvous, rather black on the back, and yellowish-white beneath; on each knee in general a black patch, and the tip of the tail of the same colour.

Aureus, in Antiquity, the Roman gold coin, equivalent to 25 denarii, or 100 sestertii. Suet. in Oth. c. iv. Tacit. Hist. lib. i. Beveria, de Ponder. p. 33, seq.

In Modern and Middle Age Writers, it is called fluidus, or folius aureus.

The aureus, according to Arbuthnot, generally weighed double the denarius; whence it must have been worth, according to the first proportion of coining mentioned by Pliny, 1 d. 3d. sterling. — According to the proportion that now obtains among us, 10 c. 9d. Plin. lib. xxxiii. c. 3.

Arbuth. tab. 25. — Andworth, however, makes the aurei (denarii) of the higher empire, weigh only five pennyweights; and under the lower empire, little more than half so much.

The weight of the aureus was gradually diminished by the emperors. The common aureus weighed at a mean 126 grains, 52 of them being contained in the Roman pound; the imperial aureus, being 45 to the pound, weighed 112 grains; and the solidus, being 72 to the pound, weighed 70 grains. 

Alexand. Severus coined pieces of one-half and one-third of the aureus, called fimmens and tremisses; whence the aureus came to be called solidus, as being their integer. Phil. Trans. vol. lxi. part ii. art. 42. See Coins, and Denarius.

Auria, Vincent, in Biography, an Italian historian, was born at Palermo in 1625, devoted himself to the profession of the law, and was admitted doctor of laws at Catania, in 1652. He afterwards relinquished this employment, and pursuing a liberal fortune, dedicated himself to literature. His works were chiefly Italian, and partly Latin, on subjects of history and antiquities. Those in highest estimation are "An History of the Great Men in Sicily," 4to, Palermo, 1704; and "An History of the Viceroys of Sicily," fol. Palermo, 1697. Now. D. C. Hill.

Auricella, in Entomology, a species of Phalana (Timea) found in France. It is fioy-white, with tellaceous streaks on the wings, and a projecting tuft of hairs on the first joint of the antennae.
and well mixed; the eye of the flower large, round, and of a good white or yellow, with the tube or neck not too wide. Such flowers as want any of these properties are constantly rejected by experienced florists; and as the varieties every year increase from seeds, the bad ones are turned out to make room for such as are good. The proper time for sowing the feed is commonly about August; but a month or two later will answer the purpose. The moist proper soil for it is a good light, fresh, sandy mould, mixed with very rotten farm-yard dung, or well rotted dung from the bottom of old hot-beds. The manner of propagating these flowers, when thus obtained, is by offsets or slips, taken from the old roots in April, when the flowers are in full blow. As these plants which have strong single heads always produce the largest clusters of flowers, the curious florists pull off the offsets as soon as it can be done with safety to the plant, in order to encourage them to flower stronger. But in order to have them to flower in the greatest perfection, they should be preferred from too much wet in winter, and have free air, and not too much sun. And in the beginning of February, if the weather be mild, the earth in the auricular pots should be taken off as far as it can be without disturbing the roots, and such as is now and fresh laid in its place. The pots must then be well covered with mats in the night to defend them from frosts while the plants are budding. When the flalks begin to become long, they should be defended from hasty rains, but not kept too much under cover, as it is apt to draw up the flalks too long, and make them weak. They should likewise be watered frequently, a little at a time, care being taken that none of the water falls on the plant. When the flowers begin to open, the pots should be removed to flages, formed with shelves, one above another, placed under cover, but open to the morning sun, and sheltered from the mid-day sun. They may remain in this situation till their flowering is over, and then be set out to have the benefit of the rains and free air, for the ripening of their seeds, which should be carefully preferred and spread on paper to dry before they are put up.

Auricularia, in Natural History, a species of Lucernaria, of a shape resembling a flalk, with a round neck; the lower part is very large, and encircled with eight tufts of tentaculi or fingers. Fabr. Groom. Mill. calls this species holothuria lagenaria reference tentaculi octos faciebilius. It inhabits the Greenland seas, adheres firmly to the leaves of the largest urine, and rarely moves; feeds on marine infests, particularly on oniches, and is about an inch and a half in length. The body is black or reddish, and sometimes, though rarely, chequered, glistened with gold; the mouth is white; the tufts of tentaculi on the body black, with white tips.

Auricularia Judas, or Jesus's ear, a kind of fungus or mushroom, somewhat resembling, in figure, a human ear. It grows on old, dried trees, the tree on which, as some pretend, Judas hanged himself; and hence, they think, the name is derived.

This fungus fleeted in water, and applied to the eyes, is said to free them of inflammations; but its chief use is under the form of a garel in decoctions, against inflammations of the throat, or swelling of the tonsils.

Auricularia. See Altarium.

Auricularia, primus, musculus, in Anatomy, the name given by Gallopinnus to the auricula auricular. He also calls the retroflexa auricula the facinus musculus.

Auricularia Retroflexa. See Retroflexiae.

Auricularia, something that relates to the ears.

Thus we say, an auricular wind, auris iufis, a wind that enters by the ear.

Auricularia Confession, is that made in the ear privately.

Auricularia, in Medicine, are such as are suited to the cure of diseases of the ear.

Auricularia, in Botany. See Hedyotis.

Auricularia, in Conchology, a species of Helix, or fresh-water snail, found in stagnant waters in Europe. This shell is imperforate, obtusely-ovate, with a short and acute spine, and capacious aperture. Lin. Fam. Suec. Mill. Zool. Dan. Donov. Brit. Shells, &c. It is very thin and brittle shell, rather pellicled, and of a brown or whitish colour; length from half an inch to an inch and a quarter, and easily known by the very ventricose appearance of the fold which.

Auricularia, in Entomology, a species of Forticula, that is perfectly known in England by the name of common ear-wig, or ear-piercer, from an opinion generally prevalent that it creeps into the ears, and thence into the brain, of people who inadvertently lie down to sleep in fields, gardens, and other places where these creatures inhabit. It is specifically distinguished from other insects of the same genus by having the wing-cases white, and fourteen joints in the antennae. Lifer calls it tearabrus fabrus, and ear-piercer; and Frisch, vermis auricularius.

The ear-wig is a very destructive creature, both in the orchard and flower-garden, and especially to wall-fruits, carnations, and roses. In order to prevent the mischief attending them, it is usual to erect hedges supporting unions of water, or to hang the hollow claws of cats or hares, tobacco pipes, &c. on sticks in different parts of the garden, for them to creep into in the day-time, in order to catch and destroy them. Reeds open at both ends, and placed among the branches of fruit-trees, are also a good trap for them, as they crowd into their open channels, and may be easily collected and thrown into a tub of water.

That the ear-wig or ear-piercer will creep into the ears of such as sleep in the open air, in those places where they inhabit cannot be denied; but those who are acquainted with the anatomy of the head, assert that it is impossible it can ever enter the brain, because, they say, there is no open communication between the ear and the brain, and the jaws of the insect are too weak to effect one. In France the same prejudice prevails against this creature, among the lower orders of people, as in England; and, as with us, it is called from that circumstance the ear-piercer (perce-oreille). Its most formidable weapon, in their opinion, is the pair of forceps at the extremity of the body, a character peculiar to the genus, and not to this particular species. "C'est cette arme," says Degeys, "qui a fait donner a cet insecte le nom de forficule, et en françois le nom reconable de perce-oreille, parce qu'on l'a imaginé que cet insecte s'introduit dans les oreilles, que de là il pénètre dans le cerveau & failit perir. Ceux qui voyant l'anatomie, connaissent l'impossibilité d'une pareille introduction dans l'intérieur du crâne, attendent qu'il n'y a point d'ouverture qui y communique; mais la fraîcheur de quelqu'un, à qui un de ces insectes sera par hasard entré dans la conduite de l'oreille, aura pu donner lieu a cette faible, &c." But the use of the fore-paws, with which the ear-wig is furnished, is to defend itself against other small insects, and when touched it never fails to display them in a threatening posture, by turning up the extremity of its abdomen. The larva differs very little from the complete insect, and runs with great agility.

Auricularis Abductor, in Anatomy. See Abdurcator.

The finger next the little finger is also called auricular, by the Greeks auris, because used in picking the ear.
AURICULATA, in Natural History, a species of Vorticella that inhabits the fresh waters of Denmark. It is naked, with two small bristles at the tail. Mill. Hist. Vern. This kind is pellucid, cylindrical; the aperture dilated into a small ear on each side.

AURICULATA, a species of Doris, of a white colour, with dorso-falciform papilae of a red colour tipped with white. This kind inhabits the north seas. Gmelin.

AURICULATED Leaf, in Botany, is a leaf which has a lobe on each side towards the base.

AURIENSIS, in Ancient Geography, an episcopal city of Africa, in Mauritania.

AURIFER, in Entomology, a species of Curculio, with a ferocious body spotted with gold. Fabricius, Sp. Inf. Inhabits America, and has the front legs long.

AURIFER, a beautiful species of Buprestis that inhabits Cayenne. The wing-cases are green, with numerous impressed golden dots, and each terminating in two teeth; legs azure. Fabricius, Oliver.

AURIFLAMMA, in the French History, properly denotes a flag or banner, belonging to the city of St. Denis, suspended over the tomb of that saint, which the religious, on occasion of any war in defence of their lands or rights, took down, with great ceremony, and gave to their protector or advocate, to be borne at the head of their forces. Du-Cange.

AURIFLAMMA is also sometimes used to denote the chief flag or banner, in any army.

AURIFLIA, in Entomology, a species of Phalana (Bombyx), that infects the apple-trees in Germany, and bears a strong resemblance to phalana chryiformis. The wings are white, with a brown rib on the under side of the anterior pair; tail bearded and yellow. The larva is hairy, black, with red lines, and white dots on the sides; a prostateen on the neck, and another near the tail. Gmelin.

AURIGA, in Astronomy, the Waggoner; a constellation of stars in the northern hemisphere: whose stars, in Ptolemy's catalogue, at 14; in Tycho's, 27; in Hevelius's, 43; in the British catalogue, 66. This is one of the 48 afterwards, mentioned by all the ancient astronomers; and represented by the figure of an old man in a kind of sitting posture, with a goat and her kids in his left hand, and a bridge in his right. Besides the Heodi, this constellation includes another of the stars which the ancients distinguished by peculiar names; that is, Capella, the goat Capra, and Anthea, Capra, which is the bright one near the shoulder, and supposed to be the mother of the Heodi, and the nurse of Jupiter. The Heodi, or the two stars in the arm of Auriga, were regarded by the ancients as affording preages of the weather; and they were so much dreaded on account of the storms and tempests that succeeded their rising, that they were said to fix up the navigation of the sea. When the day of their peculiar influence was past, they celebrated a festival with sports and games, under the denomination of "Natalis Navigationis." Germanicus calls them unfriendly stars to mariners; and Virgil joins them with Arcturus, mentioning their setting and rising as circumstances of the most important preage. To the same purpose all the ancient critics represent a part of the constellation Auriga, if not the whole of it, as deferring particular attention, and as much an object of terror as the blazing Arcturus.

AURIGA, in Ichthyology, a species of Chetodon, found in the Arabian seas. It is whitish, obliquely fuscated with brown; and the fifth ray of the dorsal fin, siliform. Forik. Fin. Arab.

The length of this fish is five inches; form nearly rhombic; whitish colour tiaged with blue; the brown oblique bands sixteen in number, and diploed nearly parallel to each other. The scales are rhombic; head banded, above flat, scaly, of a reddish white colour, with four transferful bands; iris black; mouth comice and compressed; lip rostrate and equal; posterior margin of the dorsal fin black; and its varied with black and yellowish-white; tail truncate and fulvous; lateral line bent.

AURIGNAC, in Geography, a town of France, in the department of the Upper Garonne, and chief place of a canton in the district of St. Gaudens, 53 miles south-west of Toulouse, and 10 north-west of St. Gaudens. The place contains 1225 and the canton 10,439 inhabitants; the territory includes 192.4 square kilometres and 23 communes.

AURIGNY, Hyacinth Robillard, in Biography, a French historian, was born at Caen, in 1675, became a member of the society of Jesuits in 1691, and died in 1719. His works, comprised in four volumes 12mo. printed at Paris in 1725 and in 1757, are "Memoirs, chronological and dogmatical, for Ecclesiastical History, from 1650 to 1716," with critical remarks; and "Memoirs for the Universal History of Europe," for the fame period. They are much valued for variety of materials, accuracy of dates, and elegance of style; but are not deemed impartial. Nouv. Dict. Hist.

AURIGRAPHUS, from aurum, gold, and graphe, I write, in Middle Age Writers, a copyist, or calligrapher, who wrote in gold letters.

AURILLAC, in Geography, a town of France, and principal place of a district in the department of Cantal, and, before the revolution, the capital of Lower Auvergne. It is situated on the river Jorde, in a fertile valley; and the castle, which is high, commands the town. The place contains 11,947 and its two cantons 29,224 inhabitants; its whole territory includes 350 square kilometres, and the north canton 9, and the south canton 11 communes. N. lat. 44° 55'. E. long. 2° 27'.

AVRILLE, a town of France, in the department of the Mayne and Loire, and chief place of a canton. In the diocese of Angers, one league north of Angers.

AURINIA, in Ancient Geography, a town of Italy, in Etruria.

AURIOL, in Geography, a town of France, in the department of the Mouths of the Rhone, and chief place of a canton in the district of Aix, four leagues south-east of Aix, and four N.N.E. of Marseilles.

AURIPIGMENT, called also Orpiment. See ARSENIC, Ores of, p. 3, var. 2.

AURIS, the ear. See EAR.

AURIS DIANA, in Conchology, a species of Strombus, adopted by Linnaeus and Gmelin, after Argenville. The lip projects to a sharp point; back muriicated; tail erect and pointed. Linnaeus. Inhabits the southern coasts of Africa; is about three inches long; thick; seldom of one colour, but variegated; on the back are generally three, and sometimes four, rows of tubercles, with the interstices transversely ribbed; and the outer whorl cancellated; mouth flesh-colour; pillar white. Gmelin, Sc.

AURIS HIRSUTA, a name given by Rumphius to the shell, since called marex anat by Linnaeus, and Gmel and grimaltze by Argenville.

AURIS JUDE, a species of Voluta, with a contracted oblong shell, having a smooth spire, and tridentated pillar-lip. Linnaeus. Mull. describes it as helix tetra cylindrica subgranulata, apertura lancolata, labro ad axin tridentato. This shell inhabits the seas in India, and resembles voluta auris midae, but is smaller, and narrower. The colour is brown, or white with brown waved spots; whorls of six spires, the first and exterior ones very finely fluted. Gmelin.

AURIS MALGHI, a species of Voluta, about three inches in length, and is native of New Caledonia. The
shell is fusiform, granulated, with an ovate aperture; pillar-lip cut and much spedent. This is called hekel auris medii by Mull. vern. fic. et terr. Chemnitz figures it, and two varieties of the same species, tab. 121. Conch.

AURIS MIDE, a species of Voluita, found in India, where it inhabits marshy woods and swamps, and in its manners resembles an helix. The shell is contracted, oval-oblong, spire rugose, pillar-lip bidentated. This is Helix tella fulliform granulata, aperture lanceolata, labro ad axin bidentato of Mull, vern. fic. et terr. — Auris mide of Rumphius; and auricula mide of Angereville. Liller figures one variety of this species by pl. 577. Conch. and Chemnitz another, tab. 149. f. 1597, 1598.

The length of this kind is four inches; it is brown, solid, rugose, or triated; spire large; whorls from six to nine, each terminating in a granulated band; the outer ones cancellated; aperture long, and widest beneath.

AURIS FORCI, a name synonymous with Crista galli, &c. and given by Argereville to the species of Mytilus called by Gmelin, M. crista galli.

AURIS SILENSI, a species of Voluita, about two inches in length; of a ventricose form, and short; colour brown, with longitudinal undulated striæ of a chestnut colour; aperture ovate, and spire obtuse. It is specifically described as being an oval, gibbous, umbilicated shell, with a thick black mantle on the pillar-lip. Born. Mut. This is found in England Silenus's ear-shell. Its country is unknown.

AURIS MARIANA, or sea ear-shell, a vague term for several shells of the Halioitins genus, but chiefly for the species tuberculata, which is common in the Mediterranean, and is found, though rarely, on the western coasts of England. Donov. Brit. Shells, &c.

AURISCALPIUM, a species of Turbo, that inhabits the Mediterranean sea. This shell is white, and very smooth; aperture with an advanced flat, concave, obtuse lip. Gmel. &c. This kind is milky-white and fusible; whorls of the spire seven or eight; aperture dilated, and resembling an ear-picker; with a margin.

AURISCALPIUM, an instrument wherewith to pick and cleanse the ear from wax; and also serving for some other operations relating to that part.

The word is compounded of auris, ear, and scalpo, I scratch, or pick.

AURISPA, John, in Biography, was born in 1369, at Noto, in Sicily. He studied the Greek language at Constantinople; and, having made use of Greek MSS. chiefly of Pagan writers, which were more easily obtained than the writings of Chriftians; after a second visit to Constantinople in the train of the emperor John Palaeologus, he taught the Greek and Latin languages at Bologna, Florence, and Ferrara. He was secretary to pope Eugenius IV. and Nicholas V. and enjoyed benefices in Sicily. After the death of the latter, who was his patron, he returned to Ferrara, and continued to teach and write till the time of his death in 1460. He translated some of the writings of Archimedes, and the commentaries of Hierocles on the golden verses of Pythagoras; and published poems and letters. His version of Hierocles was printed at Bazel in 1543. Nouv. Dict. Hist. Gen. Biog.

AURIST, in Medicine and Surgery, one whose profession it is to cure diseases of the ear.

AURICA, in Conchology, a species of Balanus, that inhabits the North Seas, and is described by Ellis. This shell is membranaceous, ventricose, fastened on a tube, and eared; mouth with eight valves, and dentated. Gmel. &c. — Ellis calls this lepas nudus conofo auris.

AURIS, a species of Anomia, with a shell of a somewhat ovate form, inflated, and slightly eared; beak perforated. Gault. Inhabits the seas about Norway, and bears some affinity to another species of the same genus, called by Linn. and Gmel. caput perpendiculis.

AURIS, a species of Mya, that inhabits New Zealand. The shell is ovate, compressed, and closed; hinge with two lateral teeth. Chemnitz. Colour fordid ochraceous.

AURIS, in Entomology, a species of Pemelia, with the thorax margined, dilated in front; one side on the wings-case bicarinated. Inhabits Siberia, and is entirely of a black colour. Pallas, &c.

AURIS, a species of Calantera, that inhabits Europe. The thorax is dilated into the form of two ears; shield of the head spreading, and rounded. Geoffroy calls this cedra thomae obtuse bicornis. It feeds on the oak and nut trees, and is entirely of a chineerous colour. Gmel. &c.

AURIS, in Natural History, a species of Medusa, having four cavities beneath. Linn. Fn. Svec. This kind inhabits the Baltic and other seas; is of an hemispherical form; eyelids; from two to four inches in diameter; and when floating on the sea in sunshine, reflects a beautiful splendor. The margins are fringed and yellow. Aldrovandus calls this aurita festa.

AURIS, in Zoology, a species of Lacerata; that inhabits the sandy parts of Siberia about Naryn, and the desert of Coman. It is described by Pallas as having a tail of a moderate size, round, with callous dots on each side, dilated into a semiorbicular, soft, scabrous, dentated crest. This animal is rather larger than lacerata geck; the color above is cinereous and yellowish, clouded, and thickly speckled with brown; beneath whitish; spot on the cheek, and tip of the tail beneath, black. The head is retuse; crest of the animal, when alive, turgid with blood; body ventricose and depressed, and with the legs and tail rough, with acute prominent dots; toes five, each furnished with a claw, and the three middlemost ones ferrated, the inner one having a single notch, and the others two notches each. Gmelin, &c.

AURITA, called also Hyrsos, and Shepherds, in Ancient History, the denomination of a large body of adventurers who migrated into Egypt at a very early period. Ancient and modern writers have not agreed in their conjectures concerning these enterprising and fortunate people. Many have supposed the Aurites to have been the Arabsians; but the learned Bryant maintains that they were Arkites, who had been expelled from Babylon by the sons of Shen, at the second dispersion. Unwilling to remain at home indigent and inarticulate, or unable to reftit the shock of some powerful foe, they abandoned a region which they could no longer hold in tranquillity, precipitated themselves into Egypt, drove the dispersed tribes of Ham from the most fertile part of their territories at the upper end of the Delta, and settled there. This invasion happened soon after the Syrians had become formidable by the conquests of Ninus; for we are told that the Aurita fortified the eastern borders of their new settlements towards Arabia and Chaldæa. About this time, as all the ancient historians affert, the Delta had acquired the fertility of a moras. Drained by the shepherds, it soon became a temperate and beautiful, as it was naturally a fertile, region. For the space of two centuries and a half, this bold and enterprising race kept possession of Middle and Lower Egypt. In the course of this period they discovered, we are told, many useful arts and inventions, and from time to time sent out colonies in quest of new settlements. Two hundred and sixty years after their arrival in Egypt, the poverty of the original nations, not finding
AURITUS, in Natural History, a species of Echinus that inhabits the Persian seas. The colour is yellowish-grey, with the upper margin chestnut; base flat; punctured and marked with radiated streaks; anus oblong and situated near the mouth. It is specifically described by Lekef apud Klein ediconis, as having a waved margin, the lower one rounded, upper one nearly square, and twice divided, and a gaping pore between every two avenues.—Georoede romphart. Philel. Zeceg., &c.

AURITUS, in Ornithology, a species of Turdus that inhabits Cayenne, and is called *Fournieria auricoriblanches* by Buffon; and white-eared thrush by Latham. Above, it is variegated with rufous and olive; beneath white; crown and posterior band reddish-black; chin and throat black; streak behind the eye descending on the neck, and consisting of elongated, white, glossy feathers. Gmelin, &c. Length four inches and three quarters.

AURITUS, a species of COLUMBUS, with a black head, and ears cradled with a tuft of feathers. Linn. F. Suec.

The length of this species is twelve inches. In England, they inhabit the fens near Spalding, where they breed; they are found in the northern parts of Europe, and in the temperate parts of Siberia in Iceland. It is said by Bougainville to be met with in the Falkland Islands, where it is called the diver with speckled.

The neck, like those of most other birds in this genus, is composed of twigs, roots, and flakes of aquatic-plants, and is usually found floating among the reeds and flags nearly filled with water. The female lays four or five small white eggs, which are hatched in the nest while it remains thus immered in water. Donov. Brit. Birds, &c. A. auritius, eared grebe.

Gerfin calls this species mergula genus alterum; and Buffon l' petit grebe huppé. Gmelin speaks of a variety of this species cylindus cornutus minor of Drifton; and cylindus feu pediceps minor of Will. Orr. Ray, and Albin.

AURITUS, a species of TROCHILUS, of a green-gold colour above, and white beneath; below the eyes a band of black; and in the male two tufts of feathers of a violet colour on each side of the head under the ears; legs downy. This is *mellifuga Cayenensis* of Buff. and *Parsu mouche à oreilles* of Buff. Latham describes it under the name of violet-eared humming-bird. There is a variety of this bird with a purple stripe below the eyes; near the ears a black spot, and beneath it another of blue. This species inhabits Cayenne, and is about four inches and a half in length.

AURUM ABBESSION, in Antiquity, cutting off the ears, was a punishment inflicted by the Saxon law on those who robbed churches; and afterwards on every thief; and at length on divers other criminals.

AUROBZMUNSTER, in Geography, a town of Germany, in the circle of Bavaria, 16 miles south of Passau.

AUROCAPILLA, in Ornithology, a species of MOTACILLA, found in St. Domingo, Jamaica, and other islands in the American seas. It is olive, beneath white; crown golden; eye-brows black; breast spotted with black. Gmelin. This is *fledula Prupeflexa auro capilla* of Buff. grivellute de S. Domingue of Buff. and golden-crowned throstle of the Arctic Zoology.

AUROGALLUS, MATTHEW, in Biography, a grammarian of the 16th century, was a native of Bohemia; and became professor of languages in the university of Wittenberg. Besides the affilience he gave to Luther in translating the Bible, he wrote in Latin a "Compendium of Hebrew and Chaldean Grammar," printed at Wittenberg, in 1525, and at Batif, in 1529; and a treatise on the geography of the Holy Land, intitled "De Hebraeis Urbium, Regionum, Populorum, &c. Nominibus," printed at Wittenberg, in 1526, and at Batif, in 1529. 8vo. He died in 1543. Gen. Diet.

AUOR, in Geography, a town of France, in the department of the Cher, 21 leagues north-west of Saconcs.

AUORG, a river of France which runs into the Eure, near Bourges.

AUORINTENS, in Entomology, a species of CARABUS of the austerous kind. The hells are green and rough, with raised lines; thighs rufous. Inhabits Saxony. An intermediate species between carabus auritus, and nitens.

AUORANZA, in Geography, a town of Italy, belonging to the state of Venice, in the Cadoria, seven miles north of Pieve di Cador.

AUORRA, in Astronomy, the morning twilight; or that faint light which begins to appear in a morning, when the sun is within eighteen degrees of the horizon.

AUORA, in Conchology, a very rare species of CYPEREA, discovered on the coast of Oatheite by Captain Cook. It is rather ovate; margin white; back fine orange, and without spots. Among collectors of exotic shells, it is known by the name of cypraea aurora, or morning-dawn cowry.

AUORRA, in Entomology, a species of PHALANA, in Abbot's Insects of Georgia. The upper wings are yellow; base and margin speckled with red. Smith.

AUORRA, the specific name under which Papilio Caramines is described by Linn. in F. Suec. I. n. 801.

AUORRA, a species of Papilio (Dun. Cand.) found in Siberia. The wings are fulvous; beneath, an ocular dot on the anterior wings, and a silvery dot, with a conspicuous one still smaller in the middle of the posterior pair. Fabricius, Gmelin, &c.

AUORRA, a species of LAMPÆUS (Pyrchro Fab.), given by Herbst, as a native of Pomeraia. It is black; thorax red and cancelled; wings-cases chestnut, with four elevated lines, and the intermediate spaces dotted in rows.

AUORRA, in Geography, an island belonging to the Archipelago of the New Hebrides, in the South Pacific ocean, discovered by Bougainville, in 1768. It is about twenty leagues long, and two broad, and lies nearly north and south. Its eastern shore is steep, but it has a small bay on the north-west coast. It abounds with wood and fresh water; and is inhabited. The vegetation of this island is luxuriant. The middle of it lies in S. lat. 15° 8'. E. long. 168° 17'.
AURORA, in Mythology, the goddess of the morning, was, according to Hebh, the daughter of Thes and Hyperion, and sister of Sol and Luna; but according to others, she was the daughter of Titan and Terra. Under this title the ancients defined the light which precedes the rising of the sun above our hemisphere. The poets represent her as rising out of the ocean in a chariot, drawn by two rofe-coloured horses, called by Homer, Lampus and Phloxon, with rosy fingers dropping gentle dew. The large wof on her head was folded backwards, to denote that the brightness of day was already advanced, so as to dispel the darkness of the night. Virgil describes her as ascending in a flame-coloured chariot with four horses.

AURORA, in Ornithology, a species of Psittacus that inhabits Brazil. It is yellow; arm-pits, margins of the wings, and outer great quill-feathers in the middle, red. This is psittacus latus of Brill. perrouet jaune of Satt. Or. amiancja jaune Buffon, and aurora-parrot of Latham.

The length of this bird is twelve inches; bill, cere, legs and claws white; eye-brows and irides red; tail rounded, the four exterior feathers red within from the base to the middle. Gmelin.

AURORA, in Zoology, a species of Coluber with 179 abdominal plates, and thirty-seven subcaudal scales. This is a native of America, and is of a livid colour, with the back yellow. Gmelin.

Dr. Shaw describes it as an orange-coloured snake, with yellow dorsal band and abdomen. Length about two feet and a half, and moderately thick in proportion; head rather large, and covered with very large scales; tail short, and tapering to an obtuse point.

AURORA Borealis, or Aurora Septenralis, in Physiolog., the northern dawn or light, sometimes called fireemars, is an extraordinary meteor, or luminous appearance, hurling itself in the night-time, in the northern part of the heavens; and most usually in frosty weather.

It is usually of a reddish colour, inclining to yellow, and sends out frequent coruscations of pale light, which seem to rise from the horizon in a pyramidal undulating form, and shoot, with great velocity, up to the zenith. This light sometimes appears remarkably red, as it happened Dec. 5, 1737, of which we have very full accounts from divers parts of Europe, in the Phil. Trans. No.459. sect. 7. p. 583—606.

The aurora borealis appears frequently in form of an arch; chiefly in the spring and autumn; after a dry year. The arch is partly bright, partly dark; but generally transparent. And the matter of which it consists is also found to have no effect on the rays of light which pass through it. Dr. Hamilton observes, that he could plainly discern the smallest speck in the Pleiades through the denseness of those clouds which formed the aurora borealis in 1763, without the least diminution of its splendour, or increase of twinkling. Phil. Essays, Efl. iii. p. 166.

Sometimes it produces an iris.—M. Godin judges, that most of the extraordinary meteors and appearances in the skies, related as prodigies by historians, e. g. battles, and the like, may be probably enough reduced to the class of aurora borealis. Vide Hilt. Acad. R. Sc. acad. an. 1762. p. 425.

This kind of meteor, which is more uncommon as we approach towards the equator, is almost constant during the long winter, and appears with the greatest lustre in the polar regions.

In the Shetland isles, the "merry dangers," as the northern lights are there called, are the constant attendants of clear evenings, and afford great relief amidst the gloom of the long winter nights. They commonly appear at twilight, near the horizon, of a dun colour, approaching to yellow; they some-
times continue in that state for several hours, without any perceptible motion; and afterwards they break out into streams of brighter light, spreading into columns, and altering
drily into 10,000 different shapes, and vying their
colours from all the tints of yellow to the most obscur rubbish. They often cover the whole hemisphere, and then exhibit the most brilliant appearance. Their motions at this time are most amazingly quick; and they astonish the spectator with the rapid change of their form. They break out in places where none were seen before, skimming briskly along the heavens, are suddenly extinguished, and are succeeded by an uniform dusky tract. This again is brilliantly illuminated in the same manner, and as suddenly left a dark space. In some nights, they assume the appearance of large columns, on one side of the deepest yellow, and on the other, gradually changing till it becomes undistinguishable from the sky. They have generally a strong tremulous motion from one end to the other, and this continues till the whole vanishes. As for us, who see only the extremities of these northern phenomena, we can have but a faint idea of their splendor and motions. According to the state of the atmosphere, they differ in colour; and sometimes assuming the colour of blood, they make a dreadful appearance. The ruflic fages, which observe them, become prophetic, and terrify the spectators with alarms of war, pestilence, and famine: nor, indeed, were these superflitious prefaces peculiar to the northern lights; appearances of a similar nature are of ancient date; and they were distinguished by the appellations of "phasmata," "trabes," and "bolides," according to their forms and colours. In old times they were either more rare, or less frequently noticed; but when they occurred, they were supposed to portend great events, and the timid imagination formed of them aerial conflicts.

In the northern latitudes of Sweden and Lapland, the aurora borealis are not only singularly beautiful in their appearance, but afford travellers by their almost constant effulgence a very beautiful light during the whole night. In Hudson's bay, the aurora borealis diffuses a variegated splendour, which is said to equal that of the full moon. In the north-eastern parts of Siberia, according to the description of Gmelin (Reife durch Siberien, vol. iii. p. 135.), cited and translated by Dr. Blagden (Phil. Trans. vol. lxxiv. p. 228.) these northern lights are observed to "begin with single bright pillars, rising in the north, and almost at the same time in the north-east, which gradually increasing comprehend a large space of the heavens, rush about from place to place with incredible velocity, and finally almost cover the whole sky up to the zenith, and produce an appearance as if a vast tent was expanded in the heavens, glittering with gold, rubies, and sapphire. A more beautiful spectacle cannot be painted; but whoever should see such a northern light for the first time, could not behold it without terror. For however fine the illuminations may be, it is attended, as I have learned from the relation of many persons, with such a hissing, crackling, and rushing noise through the air, as if the largest fire-works were playing off. To describe what they then hear, they make use of the expression "spue- leit chabiat," that is, the raging hoft is passing. The hunters, who pursue the white and blue foxes in the confines of the Icy sea, are often overtaken in their course by these northern lights. Their dogs are then so much frightened, that they will not move, but lie obstinately on the ground till the noise has palled. Commonly clear and calm weather follows this kind of northern lights. I have heard this account, not from one person only, but confirmed by the uniform testimony of many who have spent part of several years in these very northern regions, and inhabited different
different countries from the Yenisei to the Lena; so that no double of its truth can remain. This seems indeed to be the real birth-place of the aurora borealis." This account of the noises attending the aurora borealis, allowing for some degree of exaggeration, has been corroborated by other testimonies. A person, who lived seven years at Hudson's Bay, confirms Mr. Gmelin's relation of the fine appearance and brilliant colours of the northern lights, and particularly of their rushing noise, which he affirms he has frequently heard, and compares it to the sound produced by whirling round a stick swiftly at the end of a string. A similar noise has also been heard in Sweden. Mr. Nairne also, being in

Northampton, at a time when the northern lights were remarkably bright, is confident he perceived a hissing or whizzing sound. "Mr. Belknap, of Dover, in New-Hampshire, North America, testifies to this fact. American Trans. vol. ii. p. 196. M. Cavallo says that the crackling noise is distinctly audible, and that he has heard it more than once. Elem. of Nat. and Exp. Philos. vol. iii. p. 1490. See also Muffchenbroek Introd. Philos. vol. ii. p. 1676. § 2495. Beccevaria dell' Electricismo Artif. et Nat. p. 221.

Similar lights, called aurora australis, have been long since observed towards the south pole (see Phil. Trans. N. 461. § 23, 24, and 25. and vol. liv. No 53); and their existence has been more lately ascertained by Mr. Forster, who assures us, that, in his voyage round the world with captain Cook, he observed them in high southern latitudes, though attended with phenomena somewhat different from those which are seen here. On Feb. 17, 1773, in south lat. 58°, "a beautiful phenomenon (he says) was observed during the preceding night, which appeared again this and several following nights. It consisted of long columns of a clear white light, shooting up from the horizon to the south, and gradually spreading on the whole southern part of the sky. These columns were sometimes bent sideways at their upper extremities; and though in most respects similar to the northern lights (aurora borealis) of our hemisphere, yet differed from them in being always of a whitish colour, whereas our aural various tints, especially those of a fiery and purple hue. The sky was generally clear when they appeared, and the air sharp and cold, the thermometer standing at the freezing point."

The periods of the appearance of these northern lights are very inconstant. In some years they occur very frequently; and in others they are more rare; and it has been observed that they are more common about the time of the equinoxes than at other seasons of the year.

Dr. Halley see Philos. Trans. N 347. p. 406. or Abr. vol. iv. p. 138. has collected together several observations, which form a kind of history of this phenomenon. After having particularly described the various circumstances which attended that observed by himself and many others in March 1716, and which was singularly brilliant, he proceeds with informing us, that the first account of similar phenomena recorded in the English annals, is that of the appearance which was noticed Jan. 33, 1560, and called "burning spears" by the author of a book intitled "A Description of Meteors," by W. F. D. D. reprinted at London, in 1654. The next appearance of a like kind, recorded by Stow, occurred on October 7, 1564. In 1754, as Camden and Stow inform us, an aurora borealis was seen for two successive nights, viz. 14th and 15th of November, with appearances similar to those observed in 1716, and which are now commonly noticed. The same phenomenon was twice seen in Brabant in 1575, viz. on the 13th of February and the 28th of September; and the circumstances attending it were described by Cornelius Gemma, who compares them to flames, tinted red, and armed lightings in the air. In the year 1570, M. Maffeur observed these phenomena, as he calls them, at Bahnning, in the county of Wurtenberg, in Germany, on less than seven times in the space of twelve months; and again, at several different times, in 1581. On September 2d, 1621, the same phenomenon was seen over all France; and it was particularly described by Ges
dash; fendus, in his "Physicus," who gave it the name of "aurora borealis." Another was seen all over Germany, in Nov. 1623, and was described by Kepler. Since that time, for more than eighty years, we have no account of any such phenomenon either at home or abroad. In 1707, Mr. Neve observed one of small continuance in Ireland; and in the same year, a similar appearance was seen by Room at Copenhagen; and during this interval of eighteen months, in the years 1707 and 1708, this fort of light had been seen no less than five times. Hence it should seem, says Dr. Halley, that the air, or earth, or both, are not at all times disposed to produce this phenomenon, though it is possible it may happen in the day time, in bright moon-light, or in cloudy weather, and to pass unobserved. Dr. Halley further observes, that the aurora borealis of 1716, which he described, was visible from the west of Ireland to the coasts of Russia, and to the coast of Poland; extending at least near 32° of longitude, and from about the 50th degree of north latitude, over almost all the north of Europe; and in all places at the same time, it exhibited appearances similar to those which he observed at London. He regrets, however, that he was unable to determine its height for want of contemporary observations at different places. Father Boscovich has determined the height of an aurora borealis, observed on the 16th of December 1737, by the marquis of Poleni, to have been 825 miles; and Mr. Bergman, from a mean of thirty computations, makes the average height of the aurora borealis to be 72 Swedish, or (supposing a Swedish mile to be about 64 English miles) 468 English miles. Euler supposes the height to be several thousands of miles; and Mairan also assigns to these phenomena a very elevated region, the far greater number of them being, according to him, about 200 leagues above the surface of the earth. Dr. Blagden, speaking of the height of some fiery meteors (Phil. Trans. vol. lxiv. p. 227), says, that "the aurora borealis appears to occupy as high, if not a higher region, above the surface of the earth, as may be judged from the very distant countries to which it has been visible at the same time;" he adds, that "the great accumulation of electric matter seems to lie beyond the verge of our atmosphere, as indicated by the celeration of twilight." However the height of these meteors, none of which appear to have ascended so high as 10 miles, is trivial, compared with the elevations above ascribed to the aurora borealis. But as it is difficult to make such observations on this phenomenon as are sufficient to afford a just estimate of its altitude, they must be subject to considerable variation and to material error. It is not improbable, that the highest regions of the aurora borealis are the same with those in which fire-balls move; more especially as Dr. Blagden informs us, that instances are recorded, in which the northern lights have been seen to join, and form luminous balls, darting about with great velocity, and even leaving a train behind like the common fire-balls. This ingenious author, however, conjecturing that distinct regions are allotted to the electrical phenomena of our atmosphere, assigns the appearance of fire-balls to that region which lies beyond the limits of our corporeal atmosphere; and a greater elevation above the earth to that
accumulation of electricity in a lighter and less condensed form, which produces the wonderfully diversified streams and coruscations of the aurora borealis.

Many attempts have been made to assign the cause of this phenomenon. Dr. Halley first imagined that the watery vapours, or effluvia, rarefied exceedingly by subterraneous fire, and tinged with fulminating streams, which many naturalists have supposed to be the cause of earthquakes, might also have been the cause of this appearance. But this hypothesis was not sufficient to account for the immense extent of these phenomena over the surface of the earth, and for their being always seen on the north side of the horizon and never to the south. Abandoning this hypothesis, he conceived that the aurora borealis is produced by a kind of subtile matter, or magnetic effluvia, freely pervading the pores of the earth, and which, entering into it near its southern pole, passes out again with a like force into the ether at the same distance from the northern; the obliquity of its direction being proportional to its distance from the pole. This subtile matter, by becoming fome way or other more dense, or having its velocity increased, may be capable of producing a small degree of light, after the manner of effluvia from electric bodies, which, by a strong and quick friction, emit light in the dark: to which fort of light this seems to have a great affinity. If Dr. Halley had known, that an electrical stroke would give polarity to a needle, it, and reverse the poles of one previously ended with it, he would have been led of course to conclude that electricity and magnetic effluvia to be the same, and that the aurora borealis was this fluid performing its circulation from one pole of the earth to another; and he would thus have anticipated the hypothesis of Sign. Becorrca. See Mr. Cotes's description of this phenomenon, and method of explaining it, by effluvium emitted from the heterogeneous and fermenting vapours of the atmosphere, in Smith's Optics, p. 60, &c. or Phil. Trans. Abridg. vol. vi. part ii.

The celebrated M. de Mairan, in an express treatise on the aurora borealis, published in 1731, assigns its cause to be the Zodiacaal light, which, according to him, is no other than the sun's atmosphere; this light happening, on some occasions, to meet the upper parts of our air, on the side of the limits where universal gravity begins to act more forcibly towards the earth than towards the sun, falls into our atmosphere, to a greater or less depth, as its specific gravity is greater or less, compared with the air through which it passes. Although the whole atmosphere is not equally involved in the solar atmosphere, it is thrown off both ways from the equatorial to the polar regions. This projection is owing partly to the centrifugal force arising from the diurnal motion of the earth, which, being greatest at the equator, and decreasing towards the poles, turns aside the zodiacaal matter towards each pole; so that by his hypothesis he anticipates the discovery of aurora auriroles: and partly to the progressive motion of the earth in its annual orbit. In this case the light should dart from the equator to the poles, and not, as it really does, from the poles to the equator. Vide Tract. Phys. & Hist. de l'Aurore Borealis. Suites des Mem. de l'Acad. R. des Scient. ann. 1731. p. 3. seq. There is an abstract of Mr. Mairan's Physical and Historical Treatise of the aurora borealis, in the Phil. Trans. No. 233. or Abridg. vol. viii. p. 450.

M. Euler thinks the cause of the aurora borealis not owing to the zodiacal light, as Mr. de Mairan supposes, but to particles of our atmosphere, driven beyond its limits by the impulsion of the light of the sun. On this supposition he endeavours to account for the phenomenon observed concerning this light. He supposes the zodiacal light, and the tails of comets, to be owing to a similar cause. See Tail of Comets, and Zodiacaal Light.

Ever since the identity of lightning and of the electric matter has been ascertained, philosophers have been naturally led to seek the explication of aerial meteors in the principles of electricity; and there is now no doubt but most of them, and especially the aurora borealis, are electrical phenomena. Beside the more obvious and known appearances w hich constitute a resemblance between this meteor and the electric matter whereby lightning is produced, it has been observed, that the aurora occasions a very sensible fluctuation in the magnetic needle; that the atmosphere yields, at the time of its occurrence, a quantity of electric fire; and that, when it has extended farther than usual into the atmosphere, the flames have been attended with various sounds of rumbling and hissing, already mentioned, and attributed by Dr. Bladen (ubi supra) to small streams of electric matter running off to the earth from the great masses, or accumulations, of electricity, by which it0 supposes both meteors and the northern lights to be produced. Besides, the aurora borealis may be partly imitated by means of artificial electricity. Dr. Hamilton, of Dublin, (Phil. Eff. eff. iii.) seems to have been the first person who attempted to discover any positive evidence of the electrical quality of the aurora borealis; but the only proof he produces is an experiment of Mr. Hawkshow, by which the electrical fluid is shewn to assume appearances resembling the aurora borealis, when it passes through a vacuum. He observed, that when the air was molli, effily exhausted, the flames of electric matter were then quite white; but when a small quantity of air was let in, the light assumed more of a purple colour. The flashing of this light, therefore, from the densest regions of the atmosphere into such as are more rare, and the transitions through mediums of different densities, he considers as the cause of the aurora borealis, and of the different colours it assumes. Mr. Canton, soon after he had obtained electricity from the clouds, offered a conjecture, that the aurora borealis is occasioned by the flashing of electric fire froni positive towards negative clouds at a great distance, through the upper part of the atmosphere where the resistence is least. And he supposes, that the aurora, which happens at the time when the magnetic needle is disturbed by the heat of the earth, is the electricity of the heated air above it, which appears chiefly in the northern regions, as the alteration in the heat of the air in those parts will be the greatest; nor is this hypothesis, he says, improbable, when it is considered, that electricity is the known cause of thunder and lightning; that it has been extracted from the air at the time of an aurora borealis (see Condenser); that the inhabitants of the northern countries observe it to be remarkably strong when a sudden thaw succeeds severe cold weather; and that the tornado is known to emit and absorb the electric fluid only by the increase or diminution of its heat. Positive and negative electricity in the air, with a proper quantity of moisture to serve as a conductor, will, he conceives, account for this and other meteors sometimes seen in a clear sky. Mr. Canton afterwards contrived to exhibit this meteor by means of the Torricellian vacuum, in a glass tube about three feet long, and sealed hermetically. When one end of the tube is held in the hand, and the other applied to the conductor, the whole tube will be illuminated from end to end, and will continue luminous without interruption for a considerable time after it has been removed from the conductor. If, after this, it is drawn through the hand either way, the light will be uncommonly intense, and without the least interruption, from one hand to the other, even to its whole length.
though a great part of the electricity is discharged by this operation, it will flash at intervals, when held only at one extremity, and kept quite still; but if it be grasped by the other hand at the same time in a different place, strong flashes of light will hardly ever fail. Dust from one end to the other, and these will continue twenty-four hours and longer, without any fresh excitation. An arched double barometer of a considerable height is an improvement of this contrivance, for exhibiting the appearance of an aurora borealis, by means of the electric fire. To Mr. Canton's hypothesis it has been objected, that the electrical fire would flash in every direction, according to the position of the clouds, as well as from north to south; and that upon his hypothesis, illustrated by the tournaisi, the aurora borealis ought to be most frequent in summer, when the air is most heated, whereas it is found to be the reverse. Signor Becaria, who pursued his observations on atmospheric electricity farther than any of his associates in these inquiries, conjectures that there is a constant and regular circulation of the electric fluid from north to south, which may be the reason that it is observed in general; and he thinks that the aurora borealis may be this electric matter performing its circulation in such a state of the atmosphere as renders it visible, or approaching nearer the earth than usual.

Against this supposition it has been alleged that it ought to dart from the horizon towards the zenith in the northern hemisphere, and from the zenith towards the horizon in the southern one; whereas Mr. Forster, as we have already mentioned, informs us, that the columns shot up from the horizon towards the zenith as well in the southern hemisphere as in the northern; so that if the aurora borealis is to be regarded as the flashes of electric matter, its course is plainly directed from both poles towards the equator, and not from one pole to the other. Why the electricity of the atmosphere should be constantly found to direct its course from the poles towards the equator, and not from the equator to the poles, suggests a difficulty which an anonymous writer (Encycl. Brit.) has attempted to solve in the following manner.—Assuming three axioms; viz. that all electric bodies, when considerably heated, become conductors of electricity; that, &c. &c., non-electrics when subjected to violent degrees of cold, ought to become electric; and that cold must also increase the electric powers of such substances as are already electric, it is easy (says this writer) to deduce from these principles the cause of the aurora borealis. "The air, all round the globe, at a certain height above its surface, is found to be exceedingly cold, and as far as experiments have yet determined, exceedingly electric also. The inferior parts of the atmosphere between the tropics, are violently heated during the day-time by the reflection of the sun's rays from the earth. Such air will therefore be a kind of conductor, and much more readily part with its electricity to the clouds and vapors floating in it, than the colder air towards the north and south poles. Hence the prodigious appearances of electricity in these regions, shewing itself in thunder and other tempests of the most terrible kind. Immense quantities of the electric fluid are thus communicated to the earth; and the inferior warm atmosphere having once exhausted itself, must necessarily be recruited from the upper and colder region. This becomes very probable from what the French mathematicians observed when on the top of one of the Andes. They were often involved in clouds, which, finking down into the warm rain, appear there to be highly electrified, and discharged themselves in violent tempests of thunder and lightning; while in the mean time, on the top of the mountain, they enjoyed a calm and serene sky. In the temperate and frigid zones, the inferior parts of the atmosphere, never being so strongly heated, do not part with their electricity so easily as in the torrid zone, and consequently do not require such recruits from the upper regions; but notwithstanding the difficulty of heat observed in different parts of the earth near the surface, it is very probable that at considerable heights the degrees of cold are nearly equal all round it. Were there a like equality in the heat of the under part, there could never be any considerable loss of equilibrium in the electric atmosphere; but as the hot air of the torrid zone is perpetually bringing down vast quantities of electric matter from the cold air that lies directly above it; and as the inferior parts of the atmosphere lying towards the north and south poles do not conduct in any great degree; it thence follows, that the upper parts of the atmosphere lying over the torrid zone will continually require a supply from the northern and southern regions. This easily clears the necessity of an electric current in the upper parts of the atmosphere from each pole towards the equator: and thus we are also furnished with a reason why in the southern hemisphere the auroras have been seen more frequently in winter than in summer; namely, because at that time the electric power of the inferior atmosphere is greater on account of the cold than in summer; and consequently the abundant electricity of the upper regions must go almost wholly off to the equatorial parts, it being impossible for it to get down to the earth; hence also the aurora borealis appears very frequent and bright in the frigid zones, the degree of cold in the upper and under regions of the atmosphere being much more nearly equal in these parts than in any other. In some parts of Siberia particularly, this meteor appears constantly from October to Christmas, and its coruscations are said to be very terrifying. Travellers agree, that here the aurora borealis appears in greatest perfection; and it is to be remarked, that Siberia is the coldest country on earth. In confirmation of this, it may also be observed, that, from the experiments hitherto made with the electrical kite, the air appears considerably more electrical in winter than in summer, though the clouds are known to be often most violently electrified in the summer-time; a proof, that the electricity naturally belonging to the air is in summer much more powerfully drawn off by the clouds than in the winter, owing to the excess of heat in summer, as already observed."

"A considerable difficulty, however, still remains from the upright position which the streams of the aurora borealis are generally supposed to have; whereas, according to the hypothesis above-mentioned, they ought rather to run directly from north to south. This difficulty occurred to Dr. Halley; but he answers it by supposing his magnetic influence to pass from one pole to another in arches of great circles, arcing to a vast height above the earth, and consequently darting from the places whence the air seems to run like the radii of a circle, in which case, being set off in a direction nearly perpendicular to the surface of the earth, they must necessarily appear erect to those who see them from any part of the surface, as is demonstrated by mathematicians. It is also reasonable to think that they will take this direction rather than any other, on account of their meeting with less resistance in the very high regions of the air than in such as are lower."

"But the greatest difficulty still remains: for we have supposed the equilibrium of the atmosphere to be broken in the day-time, and restored only in the night; whereas, considering the immense velocity with which the electric fluid moves, the equilibrium ought to be restored in all parts almost instantaneously; yet the aurora borealis never appears except..."
aurora borealis.

except in the night, although its brightness is such as must sometimes make it visible to us did it really exist in the day-time.

"In answer to this it must be observed, that though the passage of electricity through a good conductor is instantaneous, yet through a bad conductor it is observed to take some time in passing. As our atmosphere therefore, much more violently heated, is but a bad conductor of electricity; though the equilibrium in it is broken, it can by no means be instantaneously restored. Add to this, that as it is the action of the sun which breaks the equilibrium, to the same action, extending over half the globe, presents almost any attempt to restore it till night, when flakes arise from various parts of the atmosphere, gradually extending themselves with a variety of undulations towards the equator."

It has been observed, that the flakes of the aurora borealis do not always move with rapidity; but they sometimes appear for a considerable time quite stationary, and they are sometimes carried in different directions with a flow motion. In order to account for these circumstances, it should be considered, that weak electric lights have been sometimes observed to exhibit the same appearance at the surface of the earth, and we may therefore suppose them much more capable of doing so at great heights above it, where the conductors are fewer in number, and much more imperfect. From instances that might be adduced, we may reasonably conclude, that small portions of our atmosphere may by various causes be so much electrified as to shine, and likewise be moved from one place to another, without parting with the electricity they have received for a considerable time. In this manner we may account for the corona, or circle, which is often formed near the zenith by the aurora borealis, when any of its parallel flakes of light that shoot upwards, and by the laws of perspective, appear to converge towards a point, are over our heads, and actually come to a point. As this corona is commonly stationary for some time, it would serve as a mark by which to determine the distance of the object; e. g. let two persons, one at London, and the other at Edinburgh, observe an aurora borealis; then by noting the flares among which the corona was observed at each place, its true altitude from the surface of the earth may easily be determined by trigonometry. Although the true height of the aurora borealis has never yet been determined, there is no sufficient reason for supposing that it is higher than a meteor, seventy miles above the surface of the earth, which meteor, both by its splendor and figure, seems to prove that the air possesses a considerable degree of density at that distance from the earth. Besides, if its streams resemble the passage of electric light through a vacuum, it cannot be hence inferred, that the air is in a state similar to the vacuum of an air-pump in those places where the aurora borealis is produced; because we have instances of similar appearances that are produced in very dense air. "The plate of an electrophorus is often so highly electrified, as to throw out flakes from different parts as soon as it is lifted up, and by proper management, it may be always made to emit long and broad flakes, which shall fearlessly be felt by the finger; instead of small, dense, and pungent sparks; so that, though long flashes may be produced in rarefied air, it by no means follows, that the same may not also be produced in denser air. As little can we infer any thing from the colours, for we observe the electric spark sometimes white, sometimes blue, and sometimes purple, in the very same state of the atmosphere, and from the same substance."

Mr. Little, the inventor of an air-pump of a new construction, flating the boundaries of the atmosphere within which the aurora borealis, considered as an electrical phenomenon, is visible, conceives that it cannot appear in air less rarefied than near 4000 times, and consequently that its nearest distance from the earth is about 45 miles, according to Dr. Halley's table of the air's rarefaction at different altitudes; and that in air rarefied more than 26,000 times, it would not be less visible, and therefore its greatest distance is about fifty miles, by the same table. He is also of opinion, that it is air burnt and exploded in its passage, which makes the electric matter visible, and that without it it could pass at all, it would not be luminous. Upon the whole he concludes, that the aurora borealis is confined within our atmosphere. Irith Trans. vol. vi. p. 237.

Dr. Franklin supposes, that the electrical fire discharging into the polar regions from many leagues of vaporized air raised from the ocean between the tropics, accounts for the aurora borealis; and that it appears first, where it is first in motion, i.e. in the most northern part, and the appearance proceeds southward, through the fire really moves northward. Franklin's Expér. and Obs. 1709, p. 49. Phil. Trans. vol. xlvii. part i. p. 358, part ii. p. 784. Ib. vol. li. part i. p. 435. Ib. vol. bxii. p. 15. Lettere dell'Eletricino, p. 269; or Priestley's Hist. of Electricity, vol. i.

Mr. Kirwan (Iriith Trans. 1758, p. 76, &c.) supposes, that the rarefaction of the atmosphere in the polar regions proceeds from the aurora borealis and aurorae, and that these are produced by a combustion of inflammable air, caused by electricity. This inflammable air is generated, particularly between the tropics, by many natural operations, such as the putrefaction of animal and vegetable substances, volatilities, &c.; and being lighter than any other, occupies of course the highest regions of the atmosphere. Consequently, this kind of air is chiefly thrown off towards the poles, and occasions the northern lights, which are the highest of all meteors, though they sometimes extend pretty low into the atmosphere. Mr. Kirwan further adds, that after the appearance of an aurora borealis, the barometer commonly falls, and that it is generally followed by high winds, proceeding usually from the south; all which facts strongly prove a rarefaction in the northern regions. To the same purpose, it is observed by Mr. Winn (Phil. Trans. vol. 1753.), that the appearance of an aurora borealis is a certain sign of an hard gale of wind from the south or south-west. This occurred, without fail, in twenty-three instances; and he thinks that the splendor of meteors will enable the observer to form some judgment concerning the ensuing tempest. If the aurora is bright, the gale will come on within twenty-four hours, but will be of no long duration; if the light is faint and dull, the gale will be less violent, and longer in coming on, but will last longer. His observations were made in the English Channel, where such winds are very dangerous; and by attending to the aurora, he says, that he often escaped, when others were nearly wrecked. Observations of this kind would serve to less the dangers of navigation.

"That the aurora borealis ought to be succeeded by winds, may be easily deduced from the hypothesis above-mentioned. If this phenomenon is occasioned by the vast quantity of electric matter conveyed to the equatorial parts of the earth, it is certain that the earth cannot receive any great quantity of this matter at one place without emitting it at another. The electricity, therefore, which is constantly received at the equator, must be emitted nearer the poles, in order to perform its course; otherwise there would not be a constant supply of it for the common operations of nature. It is to be observed, that electrified bodies are always
always surrounded by a blast of air, which is sent forth from them in all directions; hence, if the electric matter find a more ready passage through one part of the earth than another, a wind will be found to blow from that quarter. If, therefore, one of these places happens to be in the Atlantic ocean, near the coast of France, or in the bay of Biscay, the electric matter which has been received at the equator during an aurora borealis, will be discharged there some time after, and consequently a wind will blow from that quarter, which will be from the north-west to trade winds which are in the English channel. It cannot be imagined, however, that all the matter can be discharged from one place; and therefore, according to the different situations of these electric vents, winds may blow in different directions; and thus the same aurora borealis may produce a north-west wind in the English channel, and a north-east in Scotland."

**AURORA Sarcina**, a pike used by Archimedes, to express the multiplicative virtue of the philosopher's stone.

**AURORA**, in Ornithology, a species of Motacilla, called by Latham the *Daurian scarlet*. This bird is fulvous beneath; crown and upper part of the neck hoary; front whitish; throat black; back and wings black, with a white triangular spot on the latter; tail feathers fulvous, with a middle feather black. This bird is the size of the red-fart, and inhabits Siberia to the confines of China; most common in the vicinity of the river Selings, among willows.

**Auros**, in Geography, a town of France, in the department of the Gironde, and chief place of a canton in the district of Bazas, five miles north-east of Bazas. The place contains 7,500 inhabitants; the territory includes 160 kilometres and 13 communes.

**Aurota**, in Entomology, a species of Papilio (Dan. Cand.) that inhabits the coast of Coromandel. The wings are entire and white; margin black, spotted with white; posterior ones yellow beneath. Cramer.

**Aurotus**, a species of Phalena, of the larger kind of B. nubis, with falcated wings; above and beneath of the base yellowish colour; with a white band, and transparent lunar spot in the disc of each. This kind inhabits America, and was described by Fabricus from a specimen in the Museum of the late Dr. Hunter.

**Aurox**, in Geography, a town of France, in the department of the Lozere, and chief place of a canton in the district of Langogne, nineteen miles north of Melede.

**Aurulentia**, in Entomology, a species of Sphinx, of a fleshy whitish, or rather narrow form, that inhabits Carolia. The wing-cases are fuscigate, bidentate at the end, and green with a golden margin; body golden; thorax slightly dotted. Fabricus.

**Aurulentia**, a species of Cicada (Ranatra Sec.), of the size and shape of cinnam obvta. The head and thorax are rufous; wing-cases brown, cinereous at the tip. A native of Cayenne. Fabricus.

**Aurulentia**, a species of Sphinx, the head and thorax of which are covered with golden coloured down; the abdomen black, with the margin of the segments ah-colour, and the legs rufous. This insect is of the middle size, and inhabits China. Fabrerus.—Of both Fabricius and Gmelin have evidently described this insect twice; one under the specific name aurulentia, and afterwards under that of aurata; or at least the only difference in the description is, that the legs are not mentioned in the specific character of the latter, but we are told in the general description, that they are of a ferruginous colour, which approaches pretty nearly to that of rufous; and as both kinds are said to be natives of Asia, the one of China, and the other of India, we have no doubt that Fabricius has inadvertently described the same insect in both instances; and that Gmelin, without inquiry, has implicitly relied on his authority. See Aurulentia, Fabr. Mant. Inf. 1. p. 274. n. 10, and Fabr. Mant. Inf. 2. p. 324. n. 14.

**Aurum**, in Natural History, denotes gold. See Gold. The word is chiefly used among us as applied to certain chemical preparations, whereof gold is the basis, or principal ingredient.—Such are the *aurum potabile, aurum fulminans, &c.*

**Aurum Potabile**, potable gold, a liquid preparation of this metal formerly much used in medicine, but now entirely obsolete.

The discovery of an universal medicine was a favourite speculation of the ancient alchemists, and they eagerly indulged the hope of finding it in the precious metal which alone was the object of all their attention. Hence we meet with a number of vaunted preparations of gold, most of them kept secret, but some revealed by the inventors, all of which had a certain reputation for a time, but are now sunk into deserved neglect.

Two methods were practised for the preparation of this metal as a medicine; the one was to grind gold leaves to a most impalpable powder, by a triturating of several days or even weeks; the other was to dissolve the metal in its proper menstrum, the nitro-muriatic acid, and to mix it with ether or any effluent oil, which, by operating a reduction of the metal in a very divided state, has the power of separating it from its acid solvent. As this fact is important in the chemical history of this metal, we shall mention it more particularly under the article *Gold*.

The potable gold of Helvetins, retained till within these few years in the Paris pharmacopoeia, is thus prepared.

"Dissolve half a dram of pure gold in two ounces of aqua regia, employing a gentle heat; to the solution add one ounce of oil of rosinmary, shake the mixture, and immediately the gold will quit the acid, and unite with the effluent oil, giving it a beautiful yellow colour; this is to be decanted from off the acid which remains at the bottom, and mixed with fifteen ounces of rectified spirit of wine, which forms the potable gold."

The dose is from fix to twenty drops.

The powers of this medicine are ascribed to be in a very high degree cordial, stimulating, and tonic.

In such a preparation as this, when the quantity of gold in each dose is so extremely minute (though still insufficient to give it whatever of a yellow colour), it requires little discernment to see that all the medicinal powers, whatever they may be, depend altogether on the ethereal oil and the acent spirit with which the gold is united; and accordingly we now entirely reject it in every pharmacopoeia.

A fairer trial, however, has been made of the virtues of gold in medicine. We read that some of the crafty alchemical empirics had the address to persuade several of their noble patrons that the royal metal was peculiarly well calculated to cure the diseas of persons of exalted rank; and under this circumstance this precious metal has been swallowed in larger doses. These, however, are not the follies of the present day, public credulity being diverted into other channels.

From all that we know concerning the properties of gold, it appears, that it abides when taken into the human body, depends on the case with which it is reduced to the reguline state, and when in this state, its absolute insobriety in any of the animal juices. As the nitro-muriate of gold...
AUSCHIŒ, in Ancient Geography, a people of Africa, in Libya, to the west of Abydus, and call of the Nafana. Herodotus.

AUSCHI, a people of Europe, in that part of Gaul called Aquitania. Their capital was Clermerry, which afterwards assumed the name of the people. They occupied the country corresponding to the territory of Auch, west of the Touloupe. See AUCH.

AUSCULTARE, in Ancient Customs.—Because the reading of prayers with a graceful tone or accent, makes some impression on the hearers; there was anciently a person appointed, in monasteries, to hear the monks read and sing, who instructed them how to perform, before they were admitted to read or chant publicly in the church, or before the people. This was called a socius, q. d. to hear, or listen.

AUSER, or AUSAR, in Ancient Geography, now Soroch, a small river of Italy, in Etruria, which discharges itself into the sea, about six miles north of the mouth of the Arno.

AUSI, a people of Africa, on the sea-coast of Libya, encompassing the lake of Triton, and separated by the river Triton from the Marshes. Herodotus relates, that these savage people celebrated a feast in honour of Minerva, at which the young women separated into two companies, and fought against one another with clubs and staves; those who fell in the combat, or died of their wounds, were deemed not to have been virgins. They paid no respect to marriage, but prostituted their women in common. Their children were nursed by their mothers till they were able to walk; and they were then introduced to an assembly of the men, who met every three months, and the man to whom any child first spoke, was acknowledged as its father.

AUSIGDA, a town of Africa, in the Pentapolis, watered by the river Cinyicus. An island of the same name is mentioned by Stephæus.

AUSILINDUM, a place of Africa, in the province of Tripoli, on the road from Tæcipe to the greater Leptis.

AUSIMUM, or AUSIM, an ancient Roman colony, in the Picenum; now Omo, or OSIMO.

AUSINZA, a town of Alga, in Peritia Propria. Ptolemy.

AUSITÆ. See AESTEE.

AUSONA, a town of the Auvones, reckoned among the most ancient people of Italy, who occupied that part of Italy, which extends from the promontory of Circum to the straits of Sicily; but they were afterwards reduced to a more limited territory between the montes Circii and Mailetii. They were extirpated before the time of Pliny. Virgil represents them as a colony of Trojans.

AUSONIA, a name first restricted to the territory of the Auvones, and afterwards applied to the whole of Italy.

AUSONIUM MARIS, denotes that part of the Mediterranean now called the sea of Sicily. It was formerly a part of the sea called Ionic, extending southwards from the promontory of Japygium to Sicily, which it washes on the east, as it does the Bruttii and Magna Graecia on the south and west. It is separated from the Tuscan sea by the strait of Messina.

AUSONIUS, Deepus, or Decimus Magnus, in Biography, a Roman poet of the fourth century, was a native of Bourdeux, where his father Julius Anuvianus was an eminent physician. Having enjoyed the advantages of an excellent education, under his grandfather Arborius at Toulouse, and also under other eminent professors of grammar and rhetoric, he became himself professor in these departments of literature in his native city. Such was his reputa...
tion, that he was called to court by the emperor Valentinian, and appointed preceptor to his son Gratian. By the latter he was advanced to the office of praetorian prefect of Gaul and Italy about the year 376, and to the consulship in 379. He was much esteemed by the emperor Theodosius, and as some say, created by him a patrician. The time of his death is not accurately ascertained; but he appears to have been alive in 392, and probably lived to an advanced age. Amongst the learned it has been a subject of dispute, whether Anonius was a Christian or a Pagan. If he was not a Christian, the poems on Christian topics ascribed to him must have been forgeries; and the liberality of several of his pieces suggests a presumption, that he had not embraced Christianity.

His poems manifest learning and ingenuity; but they cannot bear the test of comparison with the productions of the Augustan age, as they are generally insipid, harsh, and inelegant, and bear obvious marks of the declining genius and taste of the period in which they were written. The "Cento Nuptialia" is altogether formed of lines and hemisyllables from Virgil, and the latter part of it is highly confusable for its obscurity. The epigrams are generally flat and insipid. The best editions of Anonius are the "Variorum" of 1671, and the "Delphin" of 1750. Gen. Dict. Fabr. Bib. Lat. t. ii. p. 87, &c.

AUSPEX, in Roman Antiquity, a name originally given to those who were afterwards denominated augurs. In which sense the word is supposed to be formed from avis, bird, and inferre, to inspect; avis, q.d. aviprises, or inspectors of birds.

At first the auspices were properly those who prefaged future events by inspection of the flight of birds; as the auspices predicted them by the inspection of victims, and auspices by the singing of the fame birds. But Plutarch informs us (Quot. Rom. 72.), that in process of time these distinctions were disregarded; and that the name of auspices was given to those who had originally called auspices.

AUSPICICUM, AUSPICY, the same with AUGURY. Servius, indeed, distinguishes between auspicia and auspices; making auspices comprehend the consideration merely of birds, and of their flight; auspices, of the notes of birds, and of all sensible objects; he adds, that the former was allowed a man any where abroad, whereas the latter might only be performed in his native place. And it is certain, that confuls, generals, and others, who took omens out of Rome, were properly said auspiciarum: Nevertheless, custom appears to have overthrown this distinction.

The auspices were consulted on a variety of occasions, so that nothing was done respecting the public, either at home or abroad, in peace or war, without this ceremony; and at first in important affairs of a private nature they were peremptorily regarded. The auspices were referred to before any battle; they affixed at marriages (Juvenal, x. 336.); and they were consulted on the choice of plebeian and patrician magistrates; and on the first day of every year, in order to determine whether the progress of the weather would be favorable or otherwise. To this purpose Ovid, in his Fasti (1. 167.), says:

"Tempora commis aduentia rebus agendi
Tutus est auses ne fortasse manus
Quoque fas et ars idem debet agenda,
Nee plus quam felicior tellurisque omnia.
"And in case of war, he observes Trist. ii. 173.:

"Per quem bellis geris, cujus nunc corpore pugnas
Auspicium cui des grande, deosque time.

AUSPITZ, in Geography, a town of Moravia, in the circle of Brunn, forty-two miles S.S.W. of Olmutz, and 114 S.E. of Prague.

AUSSEE, New, a town of Germany, in the duchy of Sleast, forty-eight miles W.N.W. of Jena.

AUSIG, or AUST, a town of Bohemia, in the circle of Leitmeritz, on the Elbe; 10 miles N.W. of Leitmeritz.

AUST, a very small village of England, in the county of Gloucester, on the side of the Severn; whence is a palisado-boat or ferry to the opposite shore in Gloucestershire, and thence across the Wye to Yelplow; 22 miles north of Bristol, and 6 south of Yelplow.

AUSTER, in Mythology, was like each of the other winds, one of the sons of Astra and Aurora: and it denoted the south wind. See WIND.

AUSTERE, is in general applied to a rough or ardent tale, united with that of fables. It is really synonymous with acerb.

AUSTERY, among Moral Writers, sometimes denotes vigour in the infliction of punishments. We may also, austerity of manners; the austerities of the monastic life. The austerity of the Roman cenfors kept the people in their duty. The greatest austerity of the Carthagians is perpetual solitude.

AUSTERLITZ, or SLOWKOW, in Geography, a town of Moravia, in the circle of Brunn, which was almost destroyed by the Swedes, in the seventeenth century: twelve miles E.S.E. of Brunn, and 112 S.E.E. of Prague.

AUSTIL, or St. AUSTEL, is a market and flanmary town of Cornwall, in England. It is built on the eastern side of a hill, and has greatly increased during the last century in the number of its houses and inhabitants. This augmentation may be attributed to the prospect of tin mines that are in the immediate vicinity, to the privilege of having one of the flanmary courts held here, and in consequence of having a turnpike road carried through the town from Plymouth to the land's end. The church is a large ancient pile of building dedicated to St. Austin; and the town is ornamented with several statues in canopied niches. The seats of the church, and the external walls, are carved with various devices emblematical of the crucifixion. The original charter for holding a weekly market was granted by queen Elizabeth, who directed that the tolls should be applied to the relief and maintenance of the poor.

The principal part of the inhabitants are employed in the mining concerns, in the pick-hunt, and in a small manufacture of coarse woollens. At the end of the town are three blowing-houses, where the tin is separated from the ore by means of fire. This process was formerly effected by smelting-furnaces, but the present method seems to be more economical, and far preferable. The old smelting-houses (some of which are still used in common), are supplied with coal, and are reverberatory; but in the blowing-houses, the fire is made with charcoal, and ignited by air impelled through cylindrical tubes.

AUSTIN, St. See AUGUSTIN.

AUSTIN PRIESTS. See AUGUSTINES, and HERMITS.

Austral, derived from austral, south wind, the same with southern.

Thus austral is the name given to the six last signs of the zodiac; so called, because they are on the southern side of the equinoctial.

Austral Earth, in Mineralogy. See Terra Siderica Austriade.

AUSTRAALASIA, in Geography, a name given, about half a century ago, by the learned Dr. Bruckl (Histoire des Navigateurs aux Terres Australi, Paris, 1756, 2 vols.,
Austra..
AUS

Australis, a species of Venust, of a heart-shape, white, and glossy, with brownish characters, and entire margin. Cham. Comch. A native of the South Seas.

Australis, in Entomology, a species of Cancer (Scyllerus, Fabr.), described by Fabricius from a specimen in the collection of Sir Joseph Banks, that was brought from the South Seas. The plates of the antenna are smooth and rounded. This kind bears some resemblance to Cancer Arieus; but it is of a narrower shape; the plates of two joints; thorax unequal, with created margin; legs ten; claws simple.

Australis, a species of Scorpio that inhabits Africa, and, according to Degeer and Fabricius, has thirty-two teeth in the comb, and the hand-claws smooth.

Australis, a species of Musca (Stratonym.) that inhabits South America. It is large and glabrous, with black eyes, and is specifically described as being telegonus, with a bidentated scutel; and the first segment of the abdomen brownish. Fabricius.

Australis, a species of Formica found in New Holland. It is black, with the thorax unarmed; and petiole scale armed with two spines. Fabricius.

Australis, a species of Spinex that inhabits New Holland. The color is blackish blue; thorax lobed, fulvous in front. Fabr. Gmel.

Australis, a species of Myrrhelen that inhabits the south of Europe. The wings are white, with a black spot on the margin; and the body variegated. Fabricius.

Australis, a species of Lycoerus (Fabr.) that inhabits Otaheite. It is black; thorax slightly spinous, with a red anterior band; flanks of the posterior legs membranous.

Australis, a species of Cimex, with the upper-wing rufous, marked with a waved black streak; under-wings black, with a white dot in the middle. Inhabits New Holland; and is called by Fabricius lycoerus 2-guttatus.

Australis, a species of Gryllus that inhabits Amsterdam island. It is greenish; thorax rotundate; wings and wing-cases equal; legs anteriorly very spinous; is larger, but bears some affinity to the Brazilian species spinipes.

Australis, a species of Lampyris that inhabits New Holland. It is of a yellowish colour, with the head and wing-cases brown. Fabricius.

Australis, a species of Cerambixx (Callidium Fabr.) On the thorax two white lines; on the wing-cases four; the two middle ones united and abbreviated. Inhabits New Zealand. Fabricius.

Australis, a species of Cryptoccephalus (Cirescer) that inhabits New Holland. The colour is rufous; thorax cylindrical; and two stripes of white on the wing-cases. Fabricius.

Australis, a species of Cyrtus, found in the fresh waters in New Holland. It is slightly fringed; greenish; wing-cases short; and furnished with a single tooth. Fabricius.

Australis, in Ornithology, a species of Tringa that inhabits Cayenne, and is about eleven inches in length. It is grey above, spotted with brown; beneath reddish; belly and rump whitish; tail and wings dull; bill and legs black. Gmelin, &c. The crown is fringed with brown.

Australis, a species of Sterna or Tern, that inhabits Nativity island, in the South Seas. It is grey; bill and legs black; front fordl yellow; quill feathers white; connecting membrane of the feet tawny; length from seven inches and a half to nine inches; and called by Latham the southern Tern.

Vol. III.

AUS

Australis, a species of Corvus, about eleven inches in length, that inhabits Cayenne. It is black above, beneath cinnamon; bill red; wing-covers spotted with white; tail black. Gmelin. This is the Cayenne red-billed crow of Latham. Ofj. Gmelin has another bird under the same name, corvus australis, which he describes as being entirely black; feathers on the chin lax; quill feathers brownish-black. This is the South Sea Raven of Latham, and inhabits the Friendly Islands in the South Seas. Length nineteen inches.

Australis, a species of Psittacus, of a green colour; crown blue, and crested with long-feathers; chin and middle of the abdomen red; thighs purple. A native of the Sandwich islands, and described by Latham under the name of the blue-crested parakeet. The length of this bird is six inches and a half; beak orange; front pale-green; two middle tail feathers green, and yellow at the extremity; the others yellowish-edged, and tipped with green; legs dusky; claws black. Gmelin.

Australis, a species of Falco that inhabits Statenland. It is brown; cere yellow; tail black, dotted at the end with fords white; size of the plaintive eagle; voice like a hawk. Gmelin.

AUSTRIA, Archduchy of, in Geography, one of the principal provinces of Germany, derives its name from its situation towards the east: Ojof-erzak, or Ojerich, signifying in German the eastern kingdom. This name was bestowed into Austria by the Italian and French enumeration; and this division, which may be considered as partly belonging to ancient Pannonia, arose after Charlemagne had established the western empire; being a remnant of the sovereignty of what was called Eastern France, established by that conqueror. It was also styled "Marchia Orientalis," the eastern march, or boundary; and after the failure of the Francon line, became a marquise fentatory to the dukes of Bavaria, till the emperor Frederic Barbarossa, in 1156, constituted it a duchy held immediately of the empire. See Archduke.

The archduchy of Austria is bounded on the north by Bohemia and Moravia, on the east by Hungary, on the south by Stiria, and on the west by Bavaria. It is divided by the river Enns into Upper and Lower Austria; the capital of the latter is Vienna, besides which it contains 33 other cities, and 256 market towns, and one to which it has 13 other cities, and 88 market towns. The population of this archduchy has been usually computed at 1,685,000 persons; and more lately by Hecck, in his "Statistical View of the States of Germany," at 1,820,000.

The Austrian dominions, or hereditary fates of the house of Austria, comprehended, before the late war, besides the archduchy of Lower Austria, containing the country on this side the river Enns, sometimes called Lower Austria, and the country beyond the Enns, denominated Upper Austria, and also the country called the Inn-Viertel, or the part taken from Bavaria, of which the capital is Brna; the following territories; viz. Interior Austria, including the duchies of Stiria, Carnithia, Carniola, Austria Friuli, and Trieste; Upper Austria, or the Tyrolese; Anterior Austria, comprising the Breges; and the territories in Swabia, Holensb, Falkenheit, Langenargen, and Tettnang; the kingdom of Bohemia; the magistracy of Moravia; Austrian Silesia; Austrian Netherlands, now in possession of the French; Lombardy, including the duchies of Milan and Mantua, now in possession of the French; the kingdom of Hungary, and banatee of Temet.
AUSTRIA.

war; Illyria, containing Dalmatia, Croatia, and Slavonia; Transylvania; the province of Bukovina, annexed to the Austrian territory in 1777; and the provinces of Gallicia and Lodomiria, being that part of Poland acquired by Austria in the partition of 1772. From the frontiers of Switzerlani to the utmost limits of Transylvania, the length of the Austrian dominions may be reckoned at about 750 British miles, and the breadth about 320, from the river Bug, which forms a boundary between Austria and Prussian Poland, to the Save, which divides the Austrian from the Turkish sovereignty. The contents may be about 184,000 square miles; and the Boetticher estimates the inhabitants at 108 to a square mile. Since he wrote, the populous region of the Netherlands has been withdrawn; however the population of the Venetian territories is little inferior. Towards the east, the Austrian dominions border on those of Russia and Turkey; to the north, on those of Prussia, Upper Saxony, Bavaria, from which it is separated by the river Inn, and Swabia; and on the utmost west are Switserland and the Italian states.

The original population of these extensive regions is various; but chiefly Gothic and Slavonic. The native ancient Germans, a Gothic race, from the ruling, the most industrious, and most important part of the inhabitants. The present population of the Austrian dominions is computed to exceed 40,000,000; that of Hungary, Transylvania, and the Bukovina, being estimated at 44 millions. Some authors, however, have computed the population of Hungary alone, at 7,000,000; and a late German author (see Townson, ch. v.) has consequently swollen the general population of the Austrian dominions to 25,000,000; and a modern geographer (see Pinkerton's Mod. Geog. vol. i. p. 345.) thinks it reasonable to allow 23,000,000 as a medical computation of the numbers subject to the Aultrian sceptre. Of the other chief provinces, Bohemia is supposed to hold 24 millions; Moravia 14 millions; the acquisitions in Poland, more than 3 millions; and the archduchy of Austria, as we have already stated, 1,685,000.

Hence (whi surfa) has exhibited the hereditary fates of Austria, with their respective population, in three tables; from which it appears, that Bohemia contains 2,800,493 persons; Moravia, 1,236,424; the duchy of Austrian Silesia, 250,000; Lower Austria, 1,820,000; Interior Austria or Styria, &c. 1,645,000; Superior Austria, or the Tyrol, 610,000; Anterior Austria, 293,433; Revane and the Vorarlberg, 77,971; Hungary and Illyria, 7,350,000; Transylvania, 1,443,564; Bukovina, 130,000; Lafern Galicia, 2,797,119; and Westen Galicia, 1,166,178; amounting in the whole to 21,583,798 persons. The army is composed by Boetticher at 365,455 men, in 136 regiments, of which 46 are German, and only 11 Hungarian. But in the fanguine contest with France, this army has been greatly diminished; and, at present, it is supposed not to be equal to that of Prussia, estimated at about 200,000; and far less than that of Russia, which is supposed to exceed this number. The revenue is computed at more than ten millions florins; to which Austria contributes about three millions; and Hungary a little more than a million and a half. This revenue is said to exceed the expenses; but the public debt is now supposed to surpass 40,000,000 florins, and the recent wars have occasioned great defalcations.

Austria, before the acquisition of Venice, might have been regarded as an inland power; as the small harbour of Trieste had no commercial importance. Since the Austrian dominions have acquired their present extent and power, determined rivalry has subsisted between them and France. There are also causes of confirmed jealousy between Austria and Prussia, and of irreconcilable hatred between Austria and Turkey. As Austria is also jealous of Russian power, it is not easy to cast any state on the continent with which it could enter into a strict and permanent alliance.

The aspect of the Austrian dominions is rather mountainous than level, and presents in this respect a striking contrast to that of Russia and Prussia. Of the elevated chains which diversify the Austrian territories, the first that deserves mention is the Rhetian or Tyrolese Alps, called the Brenner mountains (see Alps, and Branskk), among which are several glaciers; and there are also considerable hills, which branch from the Swiss and Tyrolese Alps, in the northern parts of the territory that was formerly Venetian, such as mount Baldo, mount Boles, and the Euganean hills near Padua. The provinces of Carinthia and Carniola present many chains of mountains, as that of Label, which separates these countries, and the Julian or Caric Alps, now called Birzhammer Wald, which divide Carinthia from Italy. The summits of the Carniolan mountains are covered with permanent snow; of these, the most memorable are the Kalenberg near the river Save, and the Reunberg, and the Karit to the south of Idria. Here also terminates the vaj chain which proceeds by the north of Dalmatia towards the Humes, and is known by many local appellations, as mount Prominia near Grin, mount Prologhi, mount Clobu, et. but better distinguished by the Dalmatian chain. The latter mountains are chiefly calcareous. Towards the north in the north of Styria, there is the chain of Bacher; mount Grafan on the east of Judenburg; and the chief mountain in this province, or those of Grimin, in its western extremity towards Salzburg. On the east towards Hungary, this country is more plain and fertile. On the south of Austria is a chain of considerable elevation. (See Cettius, and Kalenberg.) Upper Austria, or the western part of this province, contains many considerable mountains, the highest of which is the peaks called Priel, but the proper name is Greffenberg. Towards the north, Austria is divided from Bohemia by a ridge of considerable elevation, which passes to the north-east of Bavaria. On the north-west, Bohemia is parted from Saxony by a chain of metallic mountains called the Erzgebirge, a word that denotes hills containing mines. On the west of the river Eger, near its junction with the Elbe, stands the mountains group of Milesson, supposed to be the highest in the province. On the north-east the Sudetic chain, which, branching from the Carpathian, divides Bohemia and Moravia from Silesia and the Prussian dominions. The Carpathian mountains, bounding Hungary on the north-east, deserve particular notice. See Carpathian.

Of the rivers which pervades the Austrian dominions, the principal is the Danube. Next to this in importance is the Tisza; and there are also the Save, the Drave, the Inn, the Mulda, the Elbe, the Morau, the Adige, and several others of less note. The lakes are numerous, of considerable size. In Austria Proper, are the lake Traun, the Abe, and others. Carinah contains a large central lake not far from Clagenfurt, and Carniola another, called the Circuits. Tisel has no lake of any consequence, except a part of Lago de Garda; but its glaciers are numerous. For the monasteries and lakes of Hungary, see Hungary. See Neusidler and Palitz. In Transylvania is the Trafeg To; and many small lakes are situated amidst the Carpathian mountains.

6. The
The full of the Austrian dominions is upon the whole extremely fertile and productive, in spite of the neglect of industry, which has permitted many parts of Hungary, and of the Polniah provinces, to pass into wide forests and maraths. In Austria Proper, Mr. Marius observes (Travels, vol. iii. p. 104.) that oaks were little cultivated; the other products were such as those of England; particularly the abundance of cabbages and potatoes; but the cultivation was not neat, small vade spots being left by the plough, which harboured weeds to the great detriment of the field. The vineyards and fields of flaxen were numerous; cattle appeared in abundance; and large herds of hogs, which fed all the summer in the woods. At the present time, and Mr. Core (Travels in Poland, &c. vol. i. p. 153, &c.) gives a deplorable picture of the want of cultivation in the southern provinces of Poland, now subject to Austria; the country being chiefly spread over with vall tracts of gloomy forests, and exhibiting few symptoms of an inhabited, and if left of a civilized country. In travelling the high road from Cracow to Warsaw, in the course of 230 miles, he met with only two carriages and a dozen carts. The country was equally thin of human habitations, a few wooden villages succeeded one another at long intervals, whose miserable appearance corresponded with the wretchedness of the surrounding country. The darkneth of the night during which he travelled for want of decent accommodation, deprived him of nothing but the sight of different crops of corn, glyme forests, and objects of human industry. The natives were poorer, humbler, and more miserable, than any he had observed in the course of his travels; wherever he stopped, they huddled up in rows, and demanded charity with the most abject gestures. The whole country is for the most part sandy or marshy. According to this description, Austria seems to have made no great acquisition in the Polish provinces.

The domestic animals in the Austrian dominions are comparatively excellent, particularly the cattle. The mineralogy of these territories is the most various and interesting of any in Europe. There is a fertile province from the frontiers of Switzerland to the south of Turkey, which cannot boast of its minerals; and the acquisitions made by the house of Austria in Poland, contain one of the most remarkable mines in Europe, the fusing excavations of Wiliczka. See SALT, and WILIZKA. See also BOHEMIA, and MORAVIA.

The fertile archdarchy of Austria furnishes few minerals; though mines of gold are found near the abbey of Géttingen, and those of slum near Krems; salt-petre, however, is prepared in abundance; and at a little distance from St. Amberg, near the frontiers of Styria, a rich mine of silver was opened in 1754. The southern provinces of Styria, Carinthia, and Carniola, afford many important minerals. See these articles. The northern parts of Italy, new subject to Austria, have been remarkable for mineralogy; but on passing into the Tyrol, several mines occur of ancient reputation, such as that of silver and lead near Lermo; and in the same quarter, theofe of Naferin, in the Verner mountains, about 30 miles north-west of Innsbruck, which are rich in silver, copper, lead, and iron; nor is the southern region of Trent wholly destitute of mines. But the principal mines in the Austrian dominions are situated in the eastern provinces of HUNGARY and TRANSYLVANIA. See also CHEM- NITZ, and SHENNITZ.

The climate of Austria Proper is commonly mild and mild, though occasionally exposed to violent winds; and the southern provinces in general enjoy a delightful temperature, excepting merely the severities of Alpine winds in the mountainous parts. The more northern regions of Bohemia and Moravia, with the late acquisitions in Poland, can likewise boast of the maternity of the grape, and of gentle and favourable weather. The numerous lakes and moraines of Hungary, and the prodigious plains containing deferts, are supposed to render the air damp and unhealthy, the cold of the night rivalling the heat of the day; but the keen blasts from the Carpathian mountains come in masses to remedy these evils, the inhabitants being remarkable for health and vigour.

The manufactures seem not to have been cultivated to any great extent in any part of the Austrian dominions.of Vienna are the most considerable. (See VIENNA, and also BONN.) The commerce of these dominions depends principally upon their native opulence; Austria Proper, and the southern provinces, producing abundance of horses and cattle, corn, flax, linen and various wines, with several metals, particularly quicksilver from the mines of Idria. Bohemia and Moravia are also rich in oxen and sheep, corn, flax, and hemp; in which they are rivalled by the dismembered provinces of Poland. The linen manufactures of Bohemia, according to Hooch, amount annually to 16,000,000 florins, besides some in wool and in cotton. The woollen manufacture at Lintz employs 30,000 persons; and in the whole archdarchy of Austria there are seven great manufactures of cotton cloth, which occupy 140,000 individuals. The wide and marshy plains of Hungary, afford excellent pasturage for numerous herds of cattle; and other parts of the same country produce corn, rice, the rich wines of Tokay, and tobacco of an excellent flavour, with extensive mines of various metals and minerals. Upon the whole, the Austrian territories in general abound to such a degree with the various necessaries and luxuries of life, which are found either in the north or south of Europe, that the imports would seem to be few and inconsiderable; and before the acquisition of Venice, the chief exports were from the port of Trieste, consisting of quicksilver and other metals, with wines and other native products. From a table of the exports of Hungary for one year, given by Dr. Townsend, it appears, that they consisted chiefly of cattle, hogs, sheep, flour, wheat, rye, wool, and wine, carried to other Austrian provinces; and only about one-eighth part went to foreign countries.

The prevailing religion of the Austrian dominions is the Roman Catholic. However, Protestants of various sects are found in Bohemia and Moravia; nor are Lutherans unknown at Vienna, though they chiefly abound in Transylvania; and in Hungary the Protestants are supposed to be equal in number to the catholics.

The form of government is an hereditary monarchy, approaching to absolute power. Hungary, indeed, retains its ancient franchises, or rather an aristocratical state; but as the military force is lodged wholly with the sovereign, no distinct kingdom or state can withstand his will. Austria also has its franchises, consisting of four orders, clergy, peers, knights, and burgesses; the assembly for Lower Austria being held at Vienna, and that of the Upper at Lintz. But these local constitutions can little avail against the will of a powerful monarch, supported by a numerous army. The laws vary according to the different provinces; and almost every state has its peculiar code. (See HUNGARY.) Upon the whole, the laws may be regarded as mild and salutary; and the Austrians in particular are a well regulated and contented people, while the Hungarians are often dissatisfied, and retain much of their ancient animosity against the Germans.
The history of Austria properly so called, may be con-
cisely delineated in the following epochs, collected and
detailed by Mr. Pinkerton, in his "Modern Geography,"-
vol. i. p. 53-54.:

1. The house of Austria, which, by successive fortunate
marriages since the fifteenth century, has arisen to such a
summit of power, is well known to have sprung from the
humble counts of Hapsburg. Those lords possessed a small
territory in Swisserland, in the northern corner of the can-
ton of Bern, near the river Aar, about three miles south of
the town of Bruck, and the bare distance to the north of
Mellingen. On a lofty eminence, crowned with beeches,
stands an ancient tower, the first seat of the house of Austria.

2. In the twelfth century Otto I. was design'd count of Hapsburg,
and even rudely can feerely ascend beyond this grand sire
Kadobe, brother of Werner, bishop of Straubing. In
1273, Rodolph of Hapsburg was called to the imperial
throne, after an inter-regne, during which the German
potentates had increased, and secured their own power;
and wisely preferred a nominal sovereign, whose humble extract,
and small possessions, could afford no check to their ambition.
Yet Rodolph was at this time lord of the greater part of
Swiss river; after the extinction of the powerful house of
Zarller. He was now master of that of the counts of Kyburg, whose
joints inheritance devolving to Rodolph, became the basis
of his power, and that of his successors. (See Planta's
Swiss i. 176.)

3. Another emperor of the house of Austria appeared
in Albert, A. D. 1298; from whom the Siles made their
signal revolt in 1507. His son Frederic was obliged to
yield the empire to Louis of Bavaria. (See Albert i.)

4. Albert II. duke of Austria, A. D. 1438, succeeded
to three crowns, on the death of his father-in-law the
emperor Sigismund, those of Hungary, and Bohemia, and that
of the empire by unanimous election. This was the epoch
of the falling grandeur of the house of Austria. Yet his
successors Frederic III. and Maximilian I. were feeble
princes; and Charles V. finally astonisht Europe with a real
display of Austrian power. (See Albert ii.)

5. Maximilian having married the heiress of Burgundy,
the Netherlands became subject to the house of Austria in
1477; and his son Philip, in 1496, marrying the heiress of
Aragon, and Castile, the ample dominions of Spain fell
under the Austrian sceptre. Charles V. inherited all these domains; but on his resignation, Spain and the
Netherlands passed to his son Philip II. and the former
crown continued in the Austrian line till the close of
the 17th century. Austria, Bohemia, and Hungary, passed
to Ferdinand, the brother of Charles V. who was also chosen
emperor of Germany.

6. The noted bigotry of the house of Austria was not
confined to the Spanish branch, for though Maximilian
II. about 1530, had granted liberty of conscience
even to the Protantists of Austria, yet those of Bohemia,
and other parts, were afterwards so much oppressed, that
the Protestant princes of Germany called in Gustaf Adolf,
the celebrated Swedish monarch, to their assistance, who
shook the empire to its very foundation. Even France
supported the Protantists, in the view of weakening the
Austrian power; and the war continued till 1648, when
the famous treaty of Welfphalia was signed, which has
served as a basis for other diplomatic transactions. (See
Wesenschale.)

7. The war with France was often rekindled during
the long reign of Leopold I. 1658 to 1705; and in 1683
the Turks were so successful as to lay siege to Vienna.
colubrum matrix, or common snake, as to be formerly con-
confounded with it. Lamont, in his work on the Amphibia,
appears to be the first writer who distinguished them; the
principal difference seems to consist in the perfect smooth-
ness of the scales in autrario, while those of matrix are
frightly carinated. It is of a blueish-sil, inclining to rufous
on the sides and abdomen, with a double row of alternate
 RUous spots along the back. This kind lives in moist ma-
dows, hedges, and watry places, and is of a fierce disposition,
but incapable of producing injury, being supplied with
poisonous fangs. It occasionally varies a little in colour.
Gmelin, Shaw, &c.

AUSTRO AFRICUS, in Zoonology, the south-west-
well point, or wind.

AUSTROMANCY, in Mythology, properly denotes
foothsayring, or a vain method of predicting futurity, from
observations of the winds.

AUSUFAL, in Ancient Geography, the name of a place
in Africa, on the road from Carthage to Alexandria, thirty-
four miles from this latter city. Anton. Itin.

AUSUM, a town of Africa, in Mauritania Cæsariensis.

Ptolomy.

AUTARIATES, a people of Ilyria, mentioned by
Arrian, in his account of Alexander's expedition into this
country; and probably the same with those placed by
Strabo in Thrace, to the north of mount Rhodopeus.

AUTARIS, a place in Arabia Felix. Pliny.

AUTÉFAGE, in Geography, a town of France, in the
department of the Lot and Garonne, and chief place of a
canton in the district of Villeneuve d'Agen, nine miles
N. N. E. of Agen.

AUTENIQUA, an extensive and beautiful country of
Africa, lying to the east of the cape of Good Hope, and parly
inhabited by Dutch colonists. The term "Auteniqua,"
in the language of the Hottentots, denotes, "loaded
with honey," and is strictly applicable to this country, as you
cannot advance a step in it, proceeding from the Cape,
without seeing innumerable swarms of bees. Mr. Vaillant,
who visited this country in 1782, calls it the most delightful
region in the universe. It is intersected with hills and
valleys, enamelled meads and beautiful pastures; and it
abounds with small rivulets, which contribute both to
the fecernity and fertility of it. The whole of Auteniqua,
from the chain of mountains which divides it from the race
of Hottentots called "Gonaquas," to the sea, is inhabited by
planters, who rear cattle, make butter, cut down timber,
and collect honey, with all which they supply the Cape.
But though they employ wood in commerce, they use none of
it for building houses. Their habitations are wretched
hovels, constructed wicker work, daubed over with clay;
the skin of a buffalo, fixed at the four corners to as many
flakes, serves them for a bed; and the door, which serves
also for a window, is shut by a mat. The furniture is mean
and scanty, as the dwelling is incommensurable. With this
appearance of poverty and wretchedness, the people live
well; they have plenty of game and salt-water fish, and
vegetables of every kind in their gardens through the
year. For they are indebted to the fertility of the soil,
and the rivulets flowing in various directions from the
mountains by which it was watered. In the mountainous
regions of this district, there are multitudes of elephants,
buffaloes, panthers, hyenas, and antelopes of every species,
which are hunted and killed by the natives, partly for food,
and partly with a view to the preservation of their herds and
flocks. The kites and vultures of this country are singularly
fierce and voracious. Beyond the limits of the country
called "Auteniqua," is a spacious bay, with sufficient
depth of water for the largest vessels, and safe anchoring
ground, known to navigators by the name of the bay of
"Agos," but called by the colonists "Blotenberg's" bay,
from the name of a governor who visited it. In advan-
ting about a league along the coast, there is a confider-
able river called "Quur-Boom," which would afford an
ample supply of water. The Hottentots, who in scattered
villages inhabit this delightful country, are described by
Vaillant as a faithful, gentle, and rather timid race. He
allains, but probably without sufficient evidence, that they
have not any notion of superior powers who govern the
world. He also says that, totally free from jealousy, they
lead their wives to travellers who visit them. In Vaillant's
map, Auteniqua lies between 33° 30' and 34° 50' S. lat.
and between 20° and 23° 40' E. long.

AUTENOW, a town of Poland, in the palatinate
of Kiov, eighteen miles W. S. W. of Bialskirkew.

AUTENTUM, in Ancient Geography, a town of Africa,
in the route from Theoe to Travelfe, thirty miles from
Suffetula, and twenty-five miles from Amudasfar. Anton.
Itin.

AUTER Droit, in Law, is where persons sue or
are sued, in another's right; as executors, administrators,
&c.

AUTER Place; a person who holds an estate by the
life of another, is usually called tenant per auter vie. Litt. fect.

AUTERFOITS Acquit, a plea by a criminal, that he
was heretofore acquitted of the same treason or felony.
For one shall not be brought in danger of his life, or for the
same offence, more than once. 3 Hold. 213. But by Stat.
3 Hen. VIII, c. 1. this plea shall be no bar to the prosecu-
tion of any appeal. See ACQUITTAL.

AUTERFOITS Attaint, a plea of former attaint, which
is a good plea in bar, whether it be for the same or
any other felony, under some exceptions; so that this plea
is never good but when a second trial would be quite supe-
rior. See ATTAINER.

AUTERFOITS Convict, a plea upon a former convic-
tion for the same identical crime, though no judgment was
or ever will be given; and this is a good plea in bar or
indictmenet.

AUTERIVE, in Geography, a town of France, in the
department of the Upper Garonne, and chief place of a
canton in the district of Murat on the Arriege, fifteen miles
south of Toulouse. The place contains 4000, and the
number of inhabitants 5171; the territory includes 3474
kilometres, and 11 communes.

AUTHENTIC, something of received authority. It
also signifies something new, and celebrated; clothed in
all its formalities; and attested by proper persons, to whom
credit has been regularly given.

Biblical writers have differed in opinion about the mean-
ing of the phrase "Authentic letters," used by Tertullian,
De Praescription. c. 56 p. 245. B. Some by authentic letters
have understood the originals themselves, in the apostle's
handwriting, or that of his amanuensis, and signed at
the conclusion by himself. Others are of opinion, that Tertul-
lian means letters in their original language. But Dr.
Lardner, rejecting these two interpretations, maintains that
this ancient father means by authentic letters such as were
certain and well attested. In this sense the word authentic
is used by Cicero. Ad Attic. I. x. ep. 9. Accordingly, by
"Authentic letters, or epistles," but "Scriptures," and so the
word should have been rendered. Hence it may be inferred
agreeably to the argument used by Tertullian, that the
features
AUTHOR, in matters of Literature, denotes a person who has wrote or composed some book or writing. Accordingly we say, the sacred authors, anonymous authors, ancient and modern authors, &c. An original author is he who first treated of any point or subject; who did not follow any other performer; or imitate any model either in the matter or manner of what he has wrote.

AUTHORITY, in a general sense, denotes a right or power to command, and make one's self obeyed. In this sense we say, the supreme or sovereign authority; absolute or despotic authority; the royal authority; the episcopal authority; the authority of the church, of a father, &c. the authority of scripture, of a creed, confession, or the like.

Authority is also used for the testimony of an author or writing.

The word is also particularly understood of an epo- thegnem, or sentence of some great or eminent person, quoted in a discourse, either by way of proof, or embellishment.

Authority also includes rules, laws, canons, decrees, decisions, &c. alleged in confirmation of a matter in dispute. Passages quoted from Aristotle were of great authority in the schools: texts of scripture are of decisive authority.

Authorities make a species of arguments called by rhetoricians martiall orقطارic arguments. See Arguments.

For the use and effect of authorities, see Evidence, Faith, Prejudice, Probability, Reason, Revelation, &c.

Authority, in Law, is a power to do something, conveyed by word or writing; as also by writ, warrant, commissiion, letter of attorney, &c.; and sometimes by law.

Authority, or Authorities, likewise denote the treatises of ancient authors, such as Glanvil, Bradon, Britton, the author of the book Pieta, Hengham, Littleton, Statham, Brooke, Fitzherbert, Staundforde, and some others of ancient date, which are cited as authority; and furnish evidence that cases have formerly happened in which particular points were determined, which are now become settled and fixed principles.

One of the bills of these methodical writers, in point of time, whose works are of any intrinsic authority in the courts of justice, and do not entirely depend on the questions from older authors, is Sir Edward Coke, who hath written four volumes of statutes, as he is pleased to call them, though, fays judge Blackstone, they have little of the institutional method to warrant such a title.

AUTURE, in Geography, a river of France, which runs into the sea, eight miles north from the mouth of the Somme, and separates the department of the graves of Calais from the department of the Somme, through almost its whole course.

AUTHON, a river of France, which runs into the Loire, two miles south of Angers.

AUTHON, a town of France, in the department of the Eure and Loire, and chief place of a canton in the district of Nogent le Rotron; fix leagues west-north-west of Cha- teaudun. The place contains 1,165, and the canton 10,275 inhabitants: the territory includes 315 kilomètres, and 18 comuners.

AUTHOR, formed of aut, is, or rather from the Latin participle authar, or augere, to increase; properly denotes one who created or produced any thing; and is applied, by way of eminence, to the first cause; viz. God. Thus we say, the author of nature; author of the universe, &c.

The term author is sometimes used in the same sense with inventor or inventor. Polydore Virgii has wrote eight books of the authors or inventors of things, &c. See In- vention.
but this is not to be understood in the full latitude of the words; but only as intimating, that the autocephali have the same authority over their bishops, that patriarchs had over their archbishops: in which sense, only, they are equal to patriarchs.

AUOTCHTHONES, from αὐτός, ἐμαυτός, and ἀυτοκός, τοίχος: an appellation affirmed by some nations, importing, that they sprung, or were produced, from the same stock which they still inhabited. In this sense, autochthones amounts to the same with Aborigines. In this sense it was that the Greeks, and especially the Athenians, pretended to be autochthones, and, as a badge thereof, wore a golden grasper-hopper woven in their hair, an insect supposed to have the same origin.

This favourite epithet of the Athenians, which gave denomination to one of the tribes of Athens, signifies only, "people born in the country where they live," in opposition to strangers. The common people of Athens perverted this to signify people sprung from the earth. See what Plato makes Socrates say on this matter, in Menexen, p. 518. See also Iser. in Paneg. p. 65. Cicero Orat. pro L. Phcc. 26. Tertullus says, that people of the same at Athens understood, from this epithet, that Athens was the most ancient of the Greek cities, and that it had been built by those who, from time immemorial, had been established in the country known by the name of Attica. See Herod. l. vii. § 161. Suid. voc. Αὐτοκότης, t. p. 589. History, however, destroys this last pretension; as few circumstances are better known than the time of the building of Athens.

AUTOCRATOR, from αὐτός, and ἀυτοκράτος, power; a person vested with an absolute independent power, by which he is rendered accountable to any other for his actions. The power of the Athenian generals, or commanders, was usually limited; so that, at the expiration of their office, they were liable to render an account of their administration. But, on some extraordinary occasions, they were exempted from this restraint, and sent with a full and uncontrollable authority: in which case they were styled αὐτοκράτωρ.

The same people also applied the name to some of their ambassadors, who were vested with a full power of determining matters according to their own discretion, and referred our πληροφορήτους. A τρατοκράτῳ was also a title given to the Roman emperors, first to Julius, and afterwards to his successors, like that of Caesar, or Augustus.

AUTODIDACTUS, from αὐτός, and δίδαχος, I teach; a person self-taught. It is used in divers senses, sometimes to denote a person who received his knowledge immediately from heaven without any help or study. In which sense the word occurs in Homer, and Clemens Alexandrinus.—Sometimes for him who acquires his knowledge without instruction, either by word of mouth, or reading of books. Such were the inventors of sciences and laws.—Sometimes, and that most usually, for him who arrives at learning by the use of books alone, without the assistance of any master, or instruction vivæ ense.

AUTOGYPhUS Lepis, a stone, mentioned by Plutarch, and some other of the ancients, as having naturally impressed on it the figure of Cybele. It is said to have been found in Sagaris a river of Persia. Doubtless, if any such stone ever existed, the priests had got it made to deceive the people.

AUTOGRAPHUM, formed of αὐτός, and γράφω, I write, the very hand writing of any person; or the original of a treatise or discourse.——The word is used in opposition to a copy.

Autographia, or original MSS. of the New Testament, are the first copies of each book, which were written either by the apostles themselves, or by amanuenses under their immediate inspection. St. Paul usually adopted the latter mode: but to prevent the circulation of spurious epistles, he wrote the concluding benediction with his own hand. See Rom. xvi. 22. Gal. vi. 11. and 2 Theil. iii. 17, 18. compared with ch. ii. 2. and 1. Cor. xvi. 21. None of these original MSS. are now remaining, nor could they have been preserved, without the interpolation of a miracle, during the space of eighteen centuries. ‘But what benefit (says Michaelis, pretented to the N.T. by Marti, vol. p. 247-) should we derive from the possession of these MSS., what inconvenience do we sustain from their loss? No critic in chiscal literature inquires after the original of a profane author, or doubts of the authenticity of Cicero's Offices, because the copy is no longer extant which Cicero wrote with his own hand. An antiquarian, or collector of ancient records, will hardly maintain, that the probability of these books being genuine, is inferior to the probability that a record in his possession of the twelfth century is an authentic document of that period; for though his record is only 500 years old, and the works of Cicero are thrice as ancient, we are more exposed to imposition in the former instance, as the forgery of antiquities is often practised by thieves, whose businesses and profit are to lead the curious into error.

But supposing that the original MSS. of Cicero, Caesar, Paul, and Peter, were now extant, it would be impossible to decide whether they were spurious, or whether they were actually written by the hands of these authors. The case is different with respect to persons who have lived in the two last centuries, whose handwriting is known, with which a copy in question may be compared and determined; but we have no criterion, that can be applied to MSS. so old as the Christian era. Yet admitting that these original writings were extant, that we had positive proofs of their authenticity, and, what is still more, that the long period of seventeen centuries had left the colour of the letters unfaded, still they would be no infallible guide in regard to the various readings.'

Knittl, in his edition of a fragment of Ulphilas, p. 129, accounts for the loss of the original MSS. of the N.T. by supposing that the original gospels and epistles, as soon as the different communities, for whose use they were written, had taken a copy, were returned to the authors; and he says, that it was the general practice among the Christians of that age, and in support of the assertion appeals to a passage in Polycarp, and another in Jerom. But his arguments, in the opinion of Michaelis, are very unsatisfactory; and he thinks it reasonable to suppose, that the very same accidents, which have robbed us of other ancient documents, have deprived us likewise of these originals. From a passage of Ignatius, in the eighth chapter of his epistle to the Philadelphians, it has been inferred, that some of the first Christians appealed to the original MSS. at that time extant, and held them in great veneration; for which they were ridiculed, as the same passage is thought to suggest, by the early fathers, and those who had the greatest authority in the church. But the passage to which appeal is made, in order to prove the existence of the original MSS., in the time of Ignatius, is found to relate to a different subject. See Authentic.

The early loss of the autographa of the N.T. affords just matter of surprize, when we reflect that the original MSS.
MSS. of Luther and other eminent men who lived at the time of the reformation, whose writings are of much lost importance than those of the apostles, are still subsisting. Various causes may have contributed to this circumstance, of which several have been alleged in Griesbach's "Hiliorum Textus Epistolae Pauli," lect. ii. § 7, 8. Michaelis has given the following account of it. The several books of the N.T. were circulated among the Christians in numerous copies; "these were soon collected into a volume, and formed the edition in general use; and as no disputes had then arisen on the subject of various readings, they felt not the necessity of preferring in a common archive the MSS. of the apostles. The situation of the Christian churches was at that time extremely different from the present: the reading of the Greek; and Corinth, consisted of a number of small societies, that assembled separately in private houses, having no public building as a common receptacle for the whole community; and even in those private houses a moderate number only could meet together, as it was their custom not merely to pray and to teach, but likewise to celebrate their love of the epistle, which they had received from St. Paul, was not the property of any one society in particular, but belonged to the community at large, and that which was sent to the Corinthians was addressed to the communities throughout all Achaia. Each society copied the epistle in its turn, and beside the general copies many individuals probably took copies for themselves, whence the original MS. of the apostle, in passing through many hands, where perhaps not always the greatest care was taken, muli unavoidably have suffered. The Christian communities in Rome and Corinth had no common archive, or public library, in which the MS. of the apostle might have been afterwards deposited, for want of which, the original, as soon as a sufficient number of copies had been, was forgotten and lost. In other cities, the number of single societies, among which the epistle was divided, was inferior indeed to that in Rome, Corinth, or Ephesus, but the same causes contributed in each to the loss of the original epistle."

The same learned author adds, "the late or early loss of the autographs has no influence on the grounds of our faith; for the credibility of a book, which during the life of the author has been made known to the world, depends not on the preservation of the author's manuscript. Nor reader of the present work will enquire after the copy, which I send to the printer, to determine whether the work itself be spurious or authentic; nor was it necessary, for determining the authenticity of the New Testament, to preferve the originals; for each book, during the lives of the apostles, was circulated throughout the Christian world, in numberless copies, though they were not collected during that period into a single volume." As the autographa of the N.T. fell to early into oblivion, it seems reasonable, in certain cases, to make use of critical conjecture for filling the place of certain passages in the N.T. as well as in other books. On this subject, see Michaelis Introd. vol. i. § 2. p. 253, &c. For the purpose of multiplying autographs, or original copies of the same writing, several machines have been invented. See Writing Machine.

AUTOISON, in Geography, a town of France, in the department of the Upper Saone, and chief place of a canton, in the district of Vefoul; five leagues south of Bevaux.

AUTOL, a town of Spain, in Old Cafeile, one league from Cadayros.

AUTOLITHOTOMUS, he who cuts himself for the stone. See Lithotomy.

Of this we have a very extraordinary instance given by Reifelius, in the Epemerides of the Academy Natufa Curioforum, 1742, ob. 192.

AUTOLALA, in Ancient Geography, a town of Gaza, in Libya Interior, which stood between the Subus and the Salamus, the only two rivers of note, except the Gir and Niger, that watered Gaza. Nothing is now known of this ancient city, but that it gave name to the Autololes, a powerful tribe of Gaza, Proper, that spread themselves over that part of Egypt which bordered on the coast of the Atlantic ocean.

AUTOLYCUS, in Biography, a Greek mathematician and astronomer of Alexandria; he was the emperor Maximus, 252 years before Christ. He was protector in mathematics to Archimedes, who was also a disciple of Theophrastus, the successor of Aristotle. That he was an eminent mathematician appears from two of his works that are extant; viz. a treatise "On the moveable Sphere," published by Dafypoules in Greek and Latin, 8vo., at Strasbourg, in 1578; and in a Latin translation in the "Synopsis Mathematica" of Merianus, published in 4to., at Paris, in 1544; and also a treatise "On the rising and setting of the Stars," edited with the former work by Dafypodius Diog. Laert. Vit. Arcesil. Fabr. Bid. Graec. tom. ii. p. 89. Montucla Hist. Mathem. t. i. p. 192.

AUTOMATON, or Automaton, compounded of autos, self, and maithen, I am excited or ready, whence aytotomos: spontaneus; a self moving machine; or a machine which has the principle of motion within itself. Such were Archytas's flying dove, mentioned by Anesus Gallus, Noc. At. lib. x. c. 12. (See Aerostation); and regiomontanus's wooden eagle, which, as historians relate, flew forth from the chamber of the emperor Maximian, on his arrival, June 7, 1470, alighted him, and returned; also his iron fly, which, at a fateful, flew out of his hands and taking a round, returned thither again; and also Dr. Hooke's flying chariot, capable of supporting itself in the air. Hakew. Apul. c. x. sect. 1. None of the contemporary writers, though they often mention Regiomontanus, take any notice of those pieces of mechanism that have been ascribed to him, and it is probable, says Beckmann (Hist. Invent. vol. iii. p. 325.) that the whole tale originated from Peter Ramus (Schol. Mathem. i. ii. p. 65.), who never was at Nurenberg till the year 1571. Charles V., it is said, after his abdication, amused himself during the latter period of his life, with automata of various kinds.

Among automata are also reckoned all mechanical engines which go by springs, weights, &c. included within them: such are clocks, watches, &c. Vide Bapt. Port. Mag. Nat. c. 19. Scalig. Subile. 526.

When clocks were brought to perfection, some artists added to them figures, which, at the time of striking, performed certain movements, and as they functioned in this, some of them attempted to construct figure figures, detached from clocks, which either moved certain limbs, or advanced forward and ran. In the middle of the sixteenth century, when Hans Bullman, of Nurenberg, constructed figures of men and women, which moved backwards and forwards by clockwork, beat a drum, and played on the lute, according to musical time, they exited universal astonishment. The most ancient automata, of which we have any record, are the tripods constructed by Vulan (see Ilad, xviii. 373. Philostr. Oper. ed. Olearii, p. 117 and 240.), being furnished with wheels, advanced forwards to be used, and again...
again returned to their places. These tripodps, which are mentioned also by Aristotele (Polit. i. 3.) were probably only a kind of frail tables, or dumb wares, with wheels so contrived that they could be put in motion, and driven to a distance, on the smallest impulse.

Automata that represent human figures are called Andro-\footnote{The word is derived from the Greek, and means literally "man-maiden."}roides. See Annexions, under which article an account has been given of several figures of this kind. In his letter, addressed by Thomas Collinson, etc. to Dr. Hatton, we learn, that the secret of the chef-plaixier figure exhibited in various places by Mr. Kempelen (baron Kempbell), was discovered by a gentleman of rank and talents named Joseph Friederick Freyher, who published, at Dessden, in 1789, a treatise explaining its principles. A well taught boy, very thin and small of his age, so that he might be concealed in a drawer almost immediately under the chef-board, agitated the whole machine. Mr. Droz of La Chaux de Fonds, in the province of Neufchatel, has also executed some very curious pieces of mechanism. One of these was a clock, presented to the king of Span, to which pertained, among other curious contrivances, a heap that imitated the bleating of this animal, and a dog, watching a basket of fruit, that barked and snarled when any one offered to take it away, and a variety of moving human figures. Mr. Collinson informs us, that when he was at Geneva, Droz, the son of the former, showed him an oval gold filigree box, about 4 inches long, 3 broad, and 1 thick, which was double, with an horizontal partition; one of the partitions contained a bell, and in the other, upon opening the lid, there sprung up a very fine bird, of green enamelled gold, pecking on a gold brand. This minute curiosity, being only three quarters of an inch from the back to the extremity of the tail, wagged its tail, shook its wings, opened its bill of white enamelled gold, and pounced forth such a clear melodious song as would have filled a room of twenty or thirty feet square with its harmony. Another automation of Droz's was the figure of a man, about the natural size, which held in its hand a metal style; and by touching a spring that released the internal clock-work from its stop, the figure began to draw on a card of Dutch vellum laid under the style. Having finished its drawings on the first card, the figure refilled it. It then proceeded to draw different subjects on five or six other cards, which number limited its delineating powers. The first card exhibited elegant portraits and miniatures of the king and queen facing each other; and the figure was observed to start forth, professedly to lift its pencil, in the transition from one point of the draft to the other; as, e.g., from the forehead to the eye, nose, and chin, and from the waving curls of the hair to the ear, &c. without making the least flourish.

AUTODEMÓN, in Entomology, a species of Pippillo (H. bicuminus), with broad angulated wings of a brown colour above, and livid beneath; an ocular spot in the anal angle. Fabricius, &c. Native place unknown.

AUTONINE, Bernard, in Biography, a French lawyer and advocate to the parliament of Bourdeaux, was born at Agenois, in 1587, and died in 1666. The principal of the law treaties which he wrote are in French, "A Comparison of the French with the Roman law," published in 2 vols. fol. in 1644; and "A Commentary upon the Provincial Law, or La Contume, of Bourdeaux," the best edition of which is that of Dupin, 1728, fol. with notes. He also wrote in Latin, "Centena Gallina in Jus Civile Romanum," Paris, 1615, &c. and he published at Paris in 1657, in two volumes, 4to., an edition of Juvenal and Persius, with ample notes. He has been deemed an industrious rather than a judicious author. Nov. Dict. Hist.

AUTONIE, in Geography, a river of France, which runs into the Oise near Verbeke.

AUTONOMI, in Ancient Geography, so called because they were their own law-givers, a people who inhabited the most rocky and barren parts of Thrace, separated from Media by mount Hamus. In their engagement with Alexander, they behaved with extraordinary valor; but their whole army was cut in pieces, and their baggage taken, together with their wives and children. After this defeat, they submitted to the conqueror, who, in order to prevent their revolt during his absence, took with him into Asia all the chief men of their nation. They afterwards served under Perseus against the Romans; but were allowed to live according to their own laws till the reign of Vespasian, who made their country part of the province of Thrace. Thucyd. i. ii. Arrian, l. i.

AUTONOMIA, from auton, self, and nomos, law, a power of living or being governed by our own laws and magistrates. The liberty of the cities which lived under the faith and protection of the Romans, confided in their autonomy, i.e. they were allowed to make their own laws, and elect their own magistrates, by whom justice was to be administered and not by Roman presidents or judges, as was done in other places which were not indulged the autonoma.

AUTOPRAXI, from auton, self, and praxis, doing, in the Civil Law; those indulged this privilege, that they should not be summoned or compelled to pay taxes or tributes by the collectors, but should be left to their own free will. Du-Cange.

Of this number were men of distinguished dignity, and those eminent for their probity and honour.

AUTOPSY, compounded of auton, one's self, and oikos, house, ocular inspection, or the seeing a thing with one's own eyes.

AUTOPYROS, from auton, and oikos, habitation, in the Ancient Diet, an epithet given to a species of bread, wherein the whole substance of the wheat was retained, without retrenching any part of the bran.

Galen describes it otherwise, viz. as bread where only the coarser bran was taken out. And thus, it was a medium between the finest bread, called palinogamnos, and the coarsest, called perigranum.

This was also called autopyrites, and syncomylus.

AUTOUR, in Ornithology, the name under which Buffon describes the gothawk, or Falco palumbaricus of Linnaeus.

AUTOUR, in Natural History, a sort of hawk which resembles cinnamon, but is paler and thicker; it is of the colour of a broken nutmeg, and full of spangles. It comes from the Levant, and is an ingredient in the carmine dye.

AUTREAU, James D', in Biography, a painter and poet, was born at Paris, in 1656; but being of a singular and misanthropical disposition, secluded himself from the world, lived in obscurity, and died in an hospital. As a painter, though not eminent, he produced some pieces that were esteemed. With a view of doing honour to the character of cardinal Fleury, he adopted the device of exhibiting Diogenes with a lantern searching for a borenell man, and pointing him out in a portrait of the cardinal. Having nearly attained the age of sixty, he began to write for the stage; and the species of composition which he first adopted, notwithstanding his contrary disposition and habits, was light and humorous comedy. He wrote both for the Italian and French theatres. His "Port a l'Anglais" was
his first piece, and another of his works was the "Amans Ignoramus." He also composed some tragedies and serious pieces for the French theatre; and wrote Lyric compositions for the opera. The plots of his pieces are simple and artificial; but the dialogue is easy and natural; and some of his scenes contain genuine comedy. Notwithstanding all his exertions, Autreaux died in extreme poverty, at the hospital of the Incarcables in Paris, in 1745. His works were collected and published, with a preface, by Pelliefer, in four volumes, 12mo, in 1753. Nouv. Dict. Hilior.

AUTRECOURT, in Geography, a town of France, in the department of the Meuse, and chief place of a canton in the district of Clermont; four miles S. E. of Clermont, and eleven south-west of Verdun.

AUTREY, a town of France, in the department of the Upper Saone, and chief place of a canton in the district of Gray; one league north-west of Gray. The place contains 1213, and the canton 8395 inhabitants; the territory includes 270 kilometres and 21 communes.

AUTRICOURT, a town of France, in the department of the Coté d'Or, and chief place of a canton in the district of Chatillon for Seine, eight miles north of Chatillon. AUTRICOURT, in Ancient Geography, now Chartres, a town of Gaul, the capital of the Carnutes, and called Civitas Carnutum, and Carnutum. It was seated on an eminence, and seems to have derived its first name from the river Autro.

It was celebrated in Gaul, as the principal residence of the Druids, who held their assemblies among the woods in its vicinity. The name of Carnutum was probably derived from the Celtic Kar or Ker, denoting a city, and expressing its peculiar excellence.

AUTRIGANES, a people of Hispania Citerior, in Cantabria, who dwelt near the foot of the Pyrenees, towards the south-west. The only town they had on the coast was Flavionbrigia.

AUTRUCHE, in Ornithology, See STRUTTHIO Camelus.

AUTRY, in Geography, a town of France, in the department of the Ardennes, and chief place of a canton in the district of Grandpré; three leagues west of Varennes.

AUTUMN, the third season of the year; being that in which the harvest and the fruits of the summer are gathered. It begins on the day when the sun's meridian distance from the zenith, being on the decrease, is a mean between the greatest and the least; that in which these countries is supposed to happen when the sun enters Libra, or about the twenty-second day of September. Its end coincides with the beginning of winter.

Divers nations have computed the year by autumns; the English Saxons, by winters.—Tacitus tells us, the ancient Germans were acquainted with all the other feasons of the year, but had no notion of autumn. Autumn has always been reputed an unhealthy season. Tertullian calls it "testator valutadimus;" and the Latin speaks of it in the same light: "Autumnus Libitinæ quisquus aecerbe."

Autumn is commonly represented by painters under the figure of a female crowned with vine branches, and bunches of grapes; naked in that part which respects summer, and clothed in that which corresponds to winter. Its garment is covered with flowers, like that of Bacchus.

AUTUMNAL Point, is one of the equinocial points; being that from which the sun begins to descend towards the south pole.

AUTUMNAL Equinox, is the time when the sun enters the autumnal point. See Equinox.

AUTUMNAL Flowers. See Flower.

AUTUMNAL Plants, in Gardening, all such as attain perfection in autumn, either in their growth, or in their flowering.

AUTUMNAL Season, that period, which, in regard to the numerous operations to be performed in it, is commonly considered to be, from about the beginning or middle of August to the latter end of November; and in which the different works of sowing, planting, and propagation, &c. are most successfully accomplished; as, for instance, the putting in various sorts of eucalyptus plants to fland the winter for the ensuing spring and summer, such as cabbages, cauliflowers, carrots, lettuces, spinach, onions, &c. in the more early part; and in the latter, beans, peas, coloverts and early cabbage plants; likewise cauliflowers, some to remain under head and bell glasses, others in frames, to stand till spring; also lettuces on warm borders, and in frames, to fland the winter; and celery in shallow trenches, for spring use; and the making and sowing of mushroom-beds, for winter and spring. Different sorts of fibrous-rooted flower-plants are also increased at this season, by dividing or parting their roots; particularly in the months of September, October, and November, when the flower-plants decay; the clipped or divided parts most flowering the following year; and from the middle of September to the middle or end of November, is the time for transplanting from one place to another different kinds of hardy fibrous-rooted perennials, as directed under their proper genera. Most sorts of bulbous flower-roots, that were taken up in summer, are now planted in order to exhibit an early spring and summer bloom, in the following year. The seeds of many sorts of flowers are likewise at this time to be sown, which do not grow so freely when sown at other feasons, as is shown under their proper heads. In the latter part of this season it is necessary to plant cuttings, and make layers, for the propagation of various trees and shrubs of the hardy kind. The seeds of many sorts of hardy trees and shrubs may also be sown. Besides these, many other parts of garden culture are particularly necessary at this season.

AUTUMNAL Signs, are those through which the sun passes during the season of autumn, Libra, Scorpio, and Sagittarius.

AUTUMNALIS, in Ornithology, a species of PITTA, called by Buff. pittacus americanus; crick a tête bleue by Buff.; lefjer green parrot by Edwards, Av. and autumnal parrot by Latham. It is distinguished by being of a green colour, with the front and spot on the quill feathers scarlet; crown and primary quill feathers blue, Gmelin.

Of this kind there are two distinct varieties; one with the front and chin blue, and the other with the head varied with red and white. The first is var. (b) pittacus fronte fulva carunculus of Gmel; crick a tête bleue by Buff.; blue-faced green parrot of Edwards; and blue-headed creature of Baner, Guian. The latter is called Cocho in Fernand. Hist. Nov. Hist. Inhabit Guiana.

This species is about the size of a pigeon; region of the eyes blue; primary wing-coverts blue, and red at the base; tail feathers green above, and tipped with yellowish, outer one blue at the external edge; beneath yellowish, reddish at the base, with a green spot in the middle.

AUTUMNIS, a species of ANAS or duck, that inhabits South America. It is greyish; wings, tail, and belly black; spot on the wing tawny and white. Jacquin Beyri. This is the red-billed whistling duck of Edwards; anna fuscata;
AUV

Java americana of Briff. ; and Safleur à bec rouge et marais jamiés of Buffon.

This bird is represented to be of a very quarriform disposition, but may be tamed; sits on trees, and measures in length twenty-one inches. The tail is red, black at the tip; crown, back, and expullar chestnut; breast yellowish; legs yellow.

Aulomalis, a species of Tringilla, called by La- than the annual fitch. It inhabits Surinam; is of a greenish colour, with a ferruginous cap, and vent tellaceous. Limnnaeus. The tail is even at the end.

Auleunus, in Entomology, the name given by Am- erial to the moth, or phexana, called by Gmelin P. jigitans; which fex.

Auteun, in Geography, an ancient city of France, and chief place of a district in the department of the Sosne and Loire; and, before the revolution, the capital of a district called Auteunis, with a bishop's fis. It is situated near the river Arroux, at the foot of three mountains, that supply the city with water. The city itself is small, being about 9/10 of a mile in length, and about the fame breadth; it has now few good buildings, but its ruins indicate its former magnificence; and those of its walls in particular, feem, by the firm union of the flones that compose them, as if they had been cut out of the solid rock. Here are the remains of three ancient temples, one dedicated to Janus, and another to Diana; and also of a theatre, and a pyramid, the latl probably having been a tomb. It has also two beautiful antique gates; the field in which it flands is called "the field of urns," because several urns have been dug in it. Auteun was made a Roman colony by Augustus, and after him called "Augustodunum;" and as early as the reign of Claudius, it ventured of itself, and without affinities, to declare allegiance to the legions of Gaul. After a few of seven months, they stormed and plundered this unfortunate city, already walled by famine; nor was it restored till the time of Diocletian. The country from Chalon to Auteun is very rich in vineyards and cornfields, and prefects, by its lofty hills and swelling outline, a pictur- cque scene. The approach to it is by a road which winds over hills, that is covered with an underwood of broom, and crowned with a forest of birch and fir-trees. The cathedral is a handsome building. The place contains 91,760 and the canton 15,016 inhabitants; the territory includes 26,253 kilo- metres and 16 communes. N. lat 46° 56' 48". E. long. 4° 17' 42".

Auteura, in Ancient Geography, a river of Gallia Celtica, now the Euros, which falls into the Seine on the south side.

Auten, in Geography, a town of the duchy of Cour- land, thirty-six miles S. E. of Goldingen.

Auve, a town of France, in the department of the Maure, and chief place of a canton in the district of St. Monlhould, thirteen miles E. N. E. of Chalon.

Auvergne, a province of France, before the revolution, but now forming the two departments of Puy de Dôme, and Cantal, bounded on the east by Forez, on the north by Bourbonnois, on the west by Limousin, Quercy, and La Manche, on the south by Rouergue, and the Cé- vennes. Its extent from south to north is about forty French leagues, and from west to east thirty. It is divided into Upper and Lower Auvergne. The former is cold and mountainous, and yet has excellent pastures, and supplies many large cattle; the latter, to which belongs the valley of Limagne, and by which appellation it has sometimes been distinguished, is a fertile and pleasant country, abounding in wine, grain, fruit, and hemp. Auvergne supplies Lyons and Paris with fat cattle; a large quantity of cheese is made in this province; and it has several manufactories. It has mines of silver, iron, lead, and coal. Its principal rivers are the Allier, the Dordogne, and the Alagnon; which fee. The capital of the whole province is Clermont. The basaltic mountains of this ancient province are famous; and have been ascribed by some eminent naturalists to volcanoes; but as they consist chiefly of basaltic columns and elevations, others, among whom may be reckoned the best judges, allege that they have no claim to a volcanic origin. Those of Auvergne are too extensive to have been produced by a single volcano, and it would be too bold a conjecture to attribute them to a chain of volcanoes. "The northern part of the chain is styled the Puy de Dôme, while the southern is called that of Cantal. The Monts d'Or from the centre and are the highest mountains in France. The chief elevation is that of the Puy de Saâës, which rises about 6,350 feet above the level of the sea, while the Puy de Dôme is about 5,500, and the Pomb d Canta, the highest of that part, is about 6,200 feet. Near the Puy de Saâës is the Ango, that gigantic mountain, and Borchade, a shattered and wrecked elevation. The Pomb d Canta is also accompanied by bold rivals, as the Puy de Grion, le Col-de-Cabre, the Puy Mari, and the Violent. This enormous assemblage of rocks covers an extent of about 120 miles, and according to the French authors, is chiefly basaltic. The Puy de Saâës is capped with almost perpetual snow, followed in the descent by naked rocks and ancient pines; from its sides issue, from two sources, the river Dordogne, and many picture-que cascades devolve amidst basaltic columns. On the 23rd of June, 1727, Prades, a village on the slope of one of these mountains, was totally overwhelmed by its fall; the whole mountain with its basaltic columns rolling into the valley. The inhabitants were fortunately engaged in the celebration of Midsummer eve, round a bonfire at some distance. These mountains are in winter exposed to dreary and foamy hurricanes, called Mists, which in a few hours oblate the ravines, and even the precipices, and descending to the paths and streets, confine the inhabitants to their dwellings, till a communication can be opened with their neighbours, sometimes in the form of an arch under the rafters of snow. Wretched the traveller who is thus overtaken; his path disappears, the precipice cannot be distinguished from the level; if he fland he is chilled; and buried if he proceed; his eye-fight fails amidst the foamy darknes; his respiration is impeded; his head becomes giddy; he falls and perishes. In summer, thunder storms are frequent and terrible, and accompanied with torrents of large hail, which destroy the fruits and flocks, which for six months paffm on the mountains, guarded by shepherds, who have temporary cabins of turf and reed, flyed buonii." Pinkerton's Mod. Geog. vol. i. p. 274.

Auvergne, in the revolutions of France, formerly main- tained a full pre-eminence among the independent states and cities of Gaul. The brave and numerous inhab- iants displayed a singular trophy, which was the sword of Cæsar himself, which he had lost when he was repulsed before the walls of Gerovia. As the common offspring of Troy, they maintained a paternal alliance with the Romans; and if each province had imitated the courage and loyalty of Auvergne, the fall of the western empire might have been prevented or delayed. They firmly main- tained the fidelity which they had reluctantly sworn to the Visigoths; but when their bravest nobles had fallen in the battle of Poiétiers, they accepted, without reluctance, a victorious and catholic sovereignty. This easy and valuable connexi was achieved, and possified by Theodore, the eldest son of Clovis. At length, however, Childerict, the king of Paris was tempted by the neighbourhood and beauty
of Auvergne; and on the fall report that their lawful sovereign was slain in Germany, the city and diocese were betrayed by the grandson of Sidonius Apollinarius. Childeric I. beheld the splendid victory. Theodoric having promised to the Franks of Austrasia the possession of this rich and productive country, forfeited the allegiance of the inhabitants, and devoted them to destruction. His troops, reinforced by the fiercest barbarians of Germany, spread devastation over the fruitful face of Auvergne, and in two places only, the strong castle of Merloca, and the holy shrine of St. Julian at Briouze or Brioude, were saved or redeemed from their licentious fury. Before the Austrasian army retreated from Auvergne, Theodoric exacted some pledges of the future loyalty of a people, whose just hatred could only be restrained by their fear. A select band of noble youths, the sons of the principal senatorians, were delivered to the conqueror, as the hostages of the faith of Childebert and of their countrymen; and, on the first rumour of war, or conspiracy, these guillotined youths were reduced to a state of servitude; and one of them only, whose name was Attalus, escaped by a singular adventure. See Gibbon's Hist. vol. vi. p. 362—369.

AUVERGNE, a town of Switzerland, one league south of Neuchatel.

AUVERNAS, a very deep-coloured handsome wine, made of black raisins so called, which comes from Orleans. It is not fit to drink before it is above a year old; but if kept two or three years, it becomes excellent.

AUVIGNY, N. Castres d', in Biography, a French historian, was born at Hainault in 1712, and in his youth resided at La Fontaine. But engaging in the military profession, he entered into a company of life-guards, and was killed in the battle of Dettingen, in 1743. In the province of literature, he distinguished himself by several works, the principal of which was "The Lives of Illustrious Men of France, from the commencement of the Monarchy to the present time." Of this work, 8 volumes in 12mo. appeared in the author's life-time; two posthumous volumes were published by his brother; and the publication has been continued by the abbé Perauc and M. Turpin. The biographical sketches of Auvigny are written with animation and elegance, but they approach so much to fiction that they cannot be implicitly relied on as historical truth. An abridged history, written by Auvigny, and published in two vols. 12mo. is entitled "An Abridgment of the History of France, and of the Roman History, in quodlibet and answer." In 1735, he published, in five volumes 12mo. "An History of the City of Paris," but part of the fourth and the whole of the fifth, were written by M. de la Barre. The principal of Auvigny's works of imagination is "Memoirs of Madame de Berneveld." Nouv. Dict. Hist.

AUVILLARD, in Geography, a town of France, in the department of the lot and Garonne, and chief place of a canton, in the district of Agen; 13 miles south-east of Agen, and two south of Valence. The place contains 2,057, and the canton 8,767 inhabitants: the territory includes 1224 square miles and 11 communes. N. lat. 42° 3'. E. long. 0° 41'.

AUVILLERS-LES-FORGES, a town of France, in the department of the Ardennes, and chief place of a canton in the district of Rocroi, ten miles W. N. W. of Mazeres.

AVUS, in Ancient Geography, a river of Spain, in the territory of the Callics, whose course lay from east to west, and which discharged itself into the sea towards the north.

AUW, in Geography, a town of Germany, in the arch-
A U Z

The verbs have, be, will, and do, when they are uncon-

nected with a principal verb, expressed or understood, are

not auxiliaries, but principal verbs; as, we have enough;

I am grateful; he wills it to be so; they do as they please;

and in this view, they also have their auxiliaries; as, I shall

have enough; I will be grateful, &c. Murray's Eng.

Cram, p. 76.

AUXILIUM, in Law. See Aid.

AUXILIUM curis signifies an order of court, for the

suing out of one party at the suit of another.

A XILIIUS of Xilium ilium iliius, of the Xilium maritato-

num, was a wet directed to the sheriff of every county,

where the king or other lord had tenants, to levy of

them reasonable aid, towards the repair of his eldest

son, or the marriage of his eldest daughter.

AUXIMA, in Ancient Geography, a town of Spain,

mentioned by Florus.

AUXIMES, a town of Africa, in Mauritanias Cartariensis.

Ptolemy.

AUXIMUM, or AUXUMUM, OSMO, a town of Italy, in

the Picenum, south of Ancona. It was a Roman colony.

AUXO, in Mythology, the name of one of two graces

worshipped by the Athenians. See HEGEMONE.

AUXORS, in Geography, a name given before the late

division, to a territory of France, of which Semuren-Auxois

was the capital.

AUXON, a town of France, in the department of the

Aube, and chief of a canton in the district of Ervy; 44

leagues south of Troyes, and 14 north of Ervy.

AUXONNE, a town of France, in the department of

the Côte d'Or, and chief place of a canton, and seat of a

tribunal, in the district of Dijon, feated in a plain near the

east side of the Saône. It is surrounded by a double wall

built in the 17th century, and has a bridge of 23 arches

over the Saône, forming for the passage of the water when

the river overflows; and at the end of the bridge is a cause-

way of 2250 paces in length; 55 leagues E. S. E. of Dijon.

The place contains 5282, and the canton 11,356 inhabi-

tants; the territory includes 185 kilometres and 17

communes. N. lat. 47° 11' 24". E. long. 5° 23' 35".

AUXY-I-A-REUNION, a town of France, in the

department of the departments of Calais, and chief place of

a canton, in the district of St. Pol, three leagues S. S. E.

of Hédin. The place contains 2469 and the canton 13,875

inhabitants; the territory includes 185 kilometres and

28 communes.

AUXY, in the French Manufactures; a name given to that

fort of wool which is spun in the neighbourhood of Abbe-

ville, by those workmen who are called bouchers. It is a

very fine and beautiful wool, which is commonly used to

make the finest flaxen cloths.

A U ZAGUREL, or AUSSAGUREL, in Geography,

a town of Africa, in the kingdom of Adel, reckoned by

some the capital, and situated on an eminence near the

Hauran. See Adel.

A U ZANCES, a town of France, in the department of

the Creuse, and chief place of a canton, in the district of

Anbouf, feated on a hill, surrounded with ponds; 25

miles E. S. E. of Gueret, and nine south of Evaux. The

place contains 1230 and the canton 8249 inhabitants; the

territory comprehends 165 kilometres and 12 communes.

A U ZARA, OSARA, in Ancient Geography, a town of

Africa, in Syria; or according to Ptolemy, in Arabia.

Defta, S. S. E. of Cireium; situated on the western bank of

the Euphrates.

A U ZATA, AUZA, or AUZA, a town of Libya, built

according to Ptolemy, in his "Antiquities," by Ithobad,

king of the Tyrrans; situat d, according to Ptolemy, in

the interior of Mauritanias Cartharia, to the east of a lake

from which flowed the new Chindar. It was the capital

of the Aueus, who were situated to the west of the river

Triton. Titius informs us, that it was built in a small

plain, surrounded on all sides with barren forests of immense

extent. The ruins of this city were called by the neigh-

bouring Arabs "Sour Gerbal," or "the walls of the Ante-

lope:" a great part of which, flanked at proper distances

with little square towers, is still remaining.

A U ZILS, in Geography, a town of France, in the de-

partment of the Avaron, and chief place of a canton in the

district of Albin; 15 miles north-west of Rhod.z.

A U ZOIR-LE-MARCHÉ, a town of France, in the

department of the Loir and Cher, and chief place of a

canton in the district of Blois. The place contains 950 and

the canton 7150 inhabitants; the territory includes 315

kilometres and 14 communes.

A U ZON, a town of France, in the department of the

Upper Loire, and chief place of a canton, in the district

of Brioude, on the Allier, six miles north of Brioude. The

place contains 1256 and the canton 9882 inhabitants; the

territory includes 155 kilometres and 13 communes.

A U Z O U T, ADRIAN, in Biography, a French mathe-

matician of the 17th century, and one of the first members

of the Academy of Sciences at Paris, who was born at

Rouen, and died in 1693. Some have ascribed to him the

honour of having invented the Micrometer; but he is more

justly entitled to the praise of having contributed to the

improvement of it, in pursuance of the ideas suggested by M.

Huygens, and the marquis of Malvolia. (See Microme-

ter.) Auzout's treatise on this subject was published in

1677, and may be found in the Memoirs of the Academy

for 1675, tom. vii. Auzout was also concerned with M.

Picard in the important discovery of the method of applying

the telecope to the quadrant, which has been highly

useful to astronomers. It has been said, particularly by M.

de la Hire, that M. Auzout had a principal part in this

discovery; but from the description given of it by M. Picard,

in his "Figure de la Terre," the reader cannot hesitate in

pronouncing M. Picard himself to have been the original

and sole author. It appears, however, from several fragments

of letters in correspondence between our ingenious but

unfortunate countryman Mr. Caeoigae, who was killed in

the battle of Marlou-Moore, and Melr. Horrox and Crab-

tree, and which are recorded by Derham, in the Phil.

Trans. for 1723 (vol. 43, p. 190), that the method of con-
AWN, A R I S T A.

AW, a river of Scotland, in the Highlands. See Loch-Awe.

A-WEIGH, in Sea-Language, the same as A-trip, when applied to the anchor.

AWENYDHION, in British Antiquity, a name that was given to certain person in Wales, and derived from Awen, was, of course, expressive of poetical raptures. These person, when consulted about any thing doubtful, appeared to be inflamed with a high degree of enthusiasm, and even to be possessed by an invisible spirit. They were neither halting, nor very direct and explicit in their answers, or in the solution of the difficulties that were propounded to them; but in the course of a long and wild circulocution, they required and sordidly listened for the word which the latter utterers incited the words which they had uttered during their excitation. If they were, therefore, again consulted about the same subject, they would express themselves in very different words. The gift, which they possessed, was conferred upon them, as they imagined, in their sleep, and the mode of communication seemed, says Giraldus, as if new milk or honey was poured into their mouths; and others, as if a written scroll had been put into their mouths; and when they awoke, they knew and declared that they had been endowed with this extraordinary gift of divination. Some gift, referring that to which the Awen of Wales pretended, has been long known in Scotland, under the denomination of Second Sight. Warrington's Hist. Wales. p. 102, &c.

AWERRI, in Geography, a town of Africa, and capital of a kingdom of the same name, about 20 leagues from Benin to the south.

AWIN-EA, a river of Ireland, which rises in lake Ea, in the province of Donegal, and runs into the sea, seven miles north of Ballybegs.

AWK. See Aux.

AWL, or Awl, a shoemaker's implement, wherewith holes are bored in leather, to facilitate the stitching or sewing the same. The blade of the awl is usually a little flat, and bending; and the point ground to an acute angle.

AWME, or Aume, a Dutch measure of capacity for liquids, containing eight gills, or twenty seveners, or seven litres. Answering to what in England is called a trecce, or one-sixth of a ton of France, or one-seventh of an English ton. Arbuth. Tab. 33.

AWN, Arist, in Botany, the needle-like bristles which form boards of different sorts of grass or grain, as wheat, barley, &c. The word is, in some districts, pronounced Alt. It is sometimes used to signify a sharp point terminating a leaf. See Arist.

AWNING, on board a ship, is, when a full, a tarpaulin or the like, hanging over any part of the ship, above the decks, to keep off the sun, rain, or wind. The length of the main deck awning is from the centre of the fore-mast to the centre of the main-mast; the width corresponds to the breadths of the ship, taken at the main-mast, fore-mast, and at the midway between. The length of the quarter deck awning is from the centre of the main-mast to the centre of the mizen-mast; and the width answers to the breadths of the ship, at the main-mast, mizen-mast, and at the midway between. The length of the poop, or after-awning, is from the centre of the mizen-mast to the ensign-staff, about seven feet above the deck; and the width is formed agreeably to the breadths of the ship, taken at the mizen-mast, the taffarel, and at the midway between. The canvas is cut to the given breadths of the awning, allowing about nine inches to hang down on each side, which is sometimes fagolled and bound with green baaie, and is sewed together with an inch seam, and tabled all round with a two or three inch tacking. Half the diameter of the masts is cut out in the middle at each end, and lacing-holes are made across the ends to connect one awning to another. On the upper part, along the middle and sides, is sewed a one inch and half or two inch rope, to which the trucks are sewed at about three quarters of a yard distance. A thimble is spliced in each end of the rope. Sometimes curtains are made to hang to the sides of the awnings, of the same length as the awnings. Their depth is taken from the sides of the awning to the gun-wale, supposing the awning to be in its place. The faggots and tablings are the same as those of the awnings, and lacing-holes are made along the upper tabling of the curtain, and the side tabling of the awning. Clarke's Elem. and Practice of Rigging, vol. I. p. 140. 230.

In the long-boat they make an awning, by bringing the fall over the yard and flay, and booming it out with the boat-hook.

AX, a carpenter's instrument, serving to Hew wood.—The ax differs from the joiner's hatchet, in that it is much larger, and heavier, being served to hew large flue; and its edge tapering into the middle of its blade. It is furnished with a long handle or helve, as being to be used with both hands.

AX, in Geography, a town of France, in the department of the Arriére, and chief place of a canton in the district of Foix, on the Arriére; 9 leagues west of Prades, and 44 S. E. of Tarancon. The place contains 1500 and the canton 750 inhabitants; the territory includes 390 kilometers and 14 communes.

AX. See Axbridge, and Axminster.

AX. Battle. See Celt.

AXAMENTA, in Antiquity, a denomination given to the verbs, or songs, of the suli, which they sung in honour of all men.

The word is formed according to tone, from awaue q. d. nemWare. Others will have the cernina cularia to have been denominated axamenta, on account of their being written in axihus, or on wooden tablets. The axamenta were not composed, as some have asserted, but only sung by the suli. The author of them was Numa Pompius; and, as the style might not be altered, they grew in time to so obscure, that the suli themselves did not understand them. Varro says they were seven hundred years old. Quint. Infl. Or. lib. i. c. 11.

AXAMENTA,
AXE

AVANTIA, or Assenta, in Ancient Music, hymns or songs performed wholly with human voices.

AXAS, in Geography, a town of America, in the interior part of New Allion. N. lat. 39° 5', W. long. 114° 30'.

AXAT, or Axat, a town of France, in the department of the Aude, and chief place of a canton, in the district of Quillan, on the Aude; twenty-five miles south of Carcassonne, and five S. E. of Quillan.

AXEBERG, a town of Sweden, in the province of Nericia.

AXBRIDGE, a town of England, in the county of Somerset, about eight miles north of Wells, and 131 miles from London. The river Axe divides the bridge from Over-Weare, and gives the place its appellation. This town is pleasantly situated at the south-western foot of the dark Mendip hills. It has a corporation consisting of a mayor, bailiff, eight capital burgesses, and twenty-two common councilmen; and sent members to parliament, till excused at the request of the inhabitants, in the reign of Edward the third. Its market for corn, sheep, pigs, &c. is on Saturday, and two fairs are held here annually for the sale of cattle and cheese. Its only manufacture is knit-hose, in which a great number of families is employed. The church is particularly noted for its beautiful and uniform architecture, and for the lately monuments which it contains. Most of them are erected to the memory of the Prowse family, many of whom were interred within the walls. This town contains 190 houses, and 1000 inhabitants. About two miles east of Axbridge is the village of Cheddar which is celebrated for its fine cheddar, and extraordinary rocks or cliffs. The village is situated under Mendip hills, having the flat moors which extend to Glastonbury on the fourth side, and a high ridge of hills on the north. The Cheddar cliffs seem to have been the effect of some great convulsion of nature, which rent the hill asunder and formed an opening or chasm completely through it. This chasm is now appropriated to a road, which leads from the bottom to the top of the hill, having its sides formed by the high craggy rocks. The length of this gap is nearly two miles, in a winding direction. In many parts the cliffs rise to the height of full 300 feet, quite perpendicularly, some terminating in bold pinnacles, others in irregular fragments like shattered battlements, and others impeding over head in an awful manner. Yews project out of several of the fissures, forming lofty canopies, and many of the rocks wear long mantles of ivy, which produce a picturesque appearance, and form a pleasing contrast to the craggy nakedness of others. The romantic and grand appearance of these rocks attracts the notice of many travellers. Mendip hills, which are often called the alps of Somersetshire, abound with head and calamine, and like the similar hills of Derbyshire, contain many vault caverns and subterraneous vaults. Various colloidal relics are found in this limestone. Several curious plants are also obtained here, among which the following are the most rare: dianthus cefus (Cheddar Pink) d. arcoracis, and thalidium minus. Maton's Observations on the Western Counties, and Collinson's History of Somersetshire.

AXEL, a strongly fortified town of Flanders; it was taken from the Spaniards by Maurice, prince of Nassau, in 1566; nine leagues W. of Antwerp. It is now a town of France, in the department of Elcuit, and chief place of a canton in the district of L'Èchefe. The place was 1843 and the canton 9508 inhabitants; the territory includes 1874 kilometres and 10 communes. N. lat. 51° 15'. E. long. 3° 45'.

AXENS, a town of Germany, in the county of Tyrol; nine miles S. W. of Innsbruck.

AXHOLM, an island of England, in the N.W, part of Lincolnshire, formed by the rivers Trent, Idle and Dan, about ten miles long and five broad; the lower part is marshy; the middle part fertile, and produces flax in abundance. The chief town, or rather village, thinly inhabited, is called Axey.

AXIA, in Ancient Geography, a town of Greece, in the country of the Lucian Oezakans.—Also, a town of Italy, in Etruria; and the inhabitants were called Axites.

AXICA, a town of Sarmatia, at the left of the river Sagaris, and north of Odbeans (Oezakows).

AXIENCES, a river of European Sarmatia, a little above Dacia; and the people who inhabited the district to the right of this river were called Axites.

AXICA, or Azica, an ancient town of India, on this side of the Ganges. Ptolomy.

AXILLA, in Anatomy, or Axa, the cavity under the upper-part of the arm; commonly called the ax-pit.

The word is a diminutive of axis, q. d. little axis

Achesea in the axilla are usually dangerous on account of the many blood-veils, lymphatics, nerves, &c. thereabout, which form several large plexus. By the ancient laws, criminals were to be hanged by the axilla if they were under the age of puberty.

AXILLA, in Botany, is the space comprehended between the stems of plants and their leaves.

Hence we say, those flowers grow in the axilla of the leaves; i.e. at the base of the leaves or jut within the angles of their pedicles.

AXILLARY, in Anatomy, something that belongs to the axilla, or lies near them.

AXILLARY Artery, a certain portion of the great artery which supplies the upper part of the trunk, and upper extremity. See Artery, Distribution of these Vessels.

AXILLARY Vein, a certain extent of the vein corresponding to the above-mentioned artery. See the account of the Distribution of the Veins.

AXILLARY Nerves, are branches of the four lower cervical and first dorsal, which form a plexus in the axilla. See Nerve, Distribution of.

AXILLARY Glands, the glands belonging to the absorbing veils which are situated in the axilla. See Absorbing Vessels, Distribution of.

AXILLARY Leaves, in Botany. See Leaf.

AXIM, in Geography, a small district or canton of Africa, on the Gold Coast, between Cape Apollonia, and Tres Punta. The climate is unhealthy, being so moist, that, according to the proverb of the country, it rains eleven months and twenty-nine days in the year. The noise, on account of the humidity of the soil, is neither plentiful nor excellent; but it produces a great quantity of rice, which is exported to all the kingdoms of the Coast, in exchange for millet, yams, potatoes, and palm-oil; and it yields also water-melons, ananas, bananas, cocoas, oranges, two kinds of lemons, and all sorts of fruits and vegetables. Axim also produces great numbers of black cattle, sheep, goats, and tame pigeons, as well as other fowls. The whole country is filled with populous villages; fone on the sea-side, others farther up the country; and all of them rich and beautiful. The intermediate lands are well cultivated, and the soil is so fertile as richly to compensate the labour of the husbandman: besides which the natives are wealthy, from a constant traffic they maintain in gold with the Europeans. The capital of this district is Axim, or Achombene, flanding under a Dutch fort, and screened behind by a thick wood, that covers the whole declivity of a neighbouring hill. The river Axim runs through the town, and the coall is defended by
by a number of small pointed rocks, which project from the shore, and render access to it dangerous. The European settlements are, 1. The Dutch fort of St. Anthony, standing on a high rock, which projects into the sea in the form of a peninsula, and so envioled by dangerous flocks and unperceived rocks, as to be inaccessible to an enemy except by land, on which site it is fortified by a parapet, draw-bridge, and battery of heavy cannon. The Portuguese were the first founders of this settlement; but they were driven from it by the Dutch, in 1642. Its form is triangular; and it has three batteries; one towards the sea, and two towards the land. The situation of the fort is eft of the river Axim, called by the Portuguese Rio Manco, which is navigable only by canoes; but it is rich in gold dust, washed down by the streams from the inland counties.

2. Mount Manfore, three leagues distant from fort St. Anthony; near which is the large and populous town of Pocohio. Mount Manfire is well fitted around for a fort, being the first point of cape Trez Puntas. Here the Brandenburgers or Prussians had one principal factory, called Fredericesburgh; but it was taken by the Dutch, and remained in their possession. 3. Cape Trez Puntas, so called from its being composed of three points or eminences, projecting into the sea; on which are the three villages, Akora, Akron, and De Jufianne or Dickepole. See the several articles.

The government of Axim is composed of two bodies of the natives: the caberesoes, or chief men; and the maccereoes, or young men. To the former belongs the cognizance of civil affairs; but whatever is of general concern, and may properly be called national, appertains equally to both members of the state. The caberesoe is wealthy in gold and slaves, and of course less regarded by the people, and they are often impeached before the bar of the maccereoe; whereas no maccereoe can be tried for crimes of a public nature, but by his own assembly. In the distribution of justice, there is a great degree of partiality and corruption; presents of gold or brandy, conveyed to the caberesoes, enforce a favourable verdict; and justice is frequently delayed as well as perverted by the influence of bribes. The defendant, in defect of sufficient testimony on either side, by witnefls or probable circumstances, clears himself by oath: and the oath of purgation is always preferred to that of accusation. As to penalties in criminal cases, murder is punished either by death or a pecuniary mulct. However, the fine for murdering a slave is very trifling in comparison to that exacted for the life of a free man: and execution seldom takes place, unless the criminal be poor, and unable to answer the demands of his judge. The only punishment for thefts is restitution, or a fine proportioned to the property of the offender: and the creditor may seize on the property of the debtor to the amount of twice the value of what is due to him: but the usual method is to settle the account by arbitration, or restitution of the goods and chattels bought.

AXIUM, in Ancient Geography, a town of Asia, in Persia Proper, or Persia.—Allo, a town of Italy, in the Alps, belonging to the Ilarians. Prodome.

AXINAE,AXINAS, in Natural History, a genus of the Mollusca tribe (U. fera), established by Poli, in his history of the shells of the two Sicilies. The character is taken from the form of the animal; the shell it inhabits belongs in the Laminia arrangement to the Asca genus.

AXINES, in Ancient Geography, the Bay of Aligia, a large river which traversed Sarmatia, separated the Caliphides Axioe, to whom it gave name, and discharged itself into the Borythenes.

AXINA, the ancient name of a mountain of Peloponnesus, in Arcadia.

AXIUMIUM, the name given by Appian to an ancient city of Spain.

AXINOMANCY. 1. AXINOMANTIA, from καινο, secures, and μάντει, diviners, an ancient species of divination, or a method of foretelling future events by means of an ax or hatchet. This art was in considerable repute among the ancients; and was performed, according to Some, by laying an axe-head on a reed, that hatchet; and also by fixing a hatchet on a round stone, so as to be exactly poised: then certain formules of invocation were pronounced, and the names of suspected persons were repeated, and he at whose name the hatchet moved was pronounced guilty.

AXIOM, AXIOMA, from αξιω, I confess, a self-evident truth, or a proposition whose truth every person receives at first sight; and to which the term dignity is applied, on account of its importance in a process of reasoning. These axioms are self-evident truths that are necessary, and not limited to time and place, but must be true at all times and in all places.

Thus, that the whole is greater than a part; that a thing cannot be and not at the same time; and that from nothing, nothing can arise, are axioms. So, by axioms, called also maxims, are understood all common notions of the mind, whose evidence is so clear and forcible, that a man cannot deny them without renouncing common sense and natural reason.

Self-evident propositions furnish the first principles of reasoning; and it is certain, that if in our researches we merely employ such principles as theft, and apply them properly, we shall be in no danger in advancing from one discovery to another. For this we may appeal to the writings of mathematicians, which being conducted agreeably to this standard, incontestibly prove the flability of human knowledge, when it is made to rest on so firm a foundation. The propositions of this kind of science have not only flooded the field of ages, but they are found to be attended with that invincible evidence, which confines the affent of all who consider the proofs by means of which they are established.

Lord Bacon propounds a new science, to confound of general axioms, under the denomination of philosoplia prima. For an account of the origin and evidence of those truths called axioms, as well as of their importance and utility in the pursuit of knowledge and truth, see Intuition, Principles, and Common Sense.

Axiom is also an established principle in form of or science. Thus, it is an axiom in Physics, that nature does nothing in vain; that effects are proportional to their causes, &c. So it is an axiom in Geometry, that things equal to the same thing are also equal to one another; that if to equal things you add equals, the sums will be equal, &c. It is an axiom in Optics, that the angle of incidence is equal to the angle of reflection, &c. In this sense the general laws of motion are called axioms; as that all motion is rectilinear, that action and reaction are equal, &c. See Laws of Motion.

These particular axioms, it may be observed, do not immediately arise from any first notions or ideas, but are deduced from certain hypotheses; this is particularly observable in physical matters, wherein, as several experiments contribute to make one hypothesis, so several hypotheses contribute to one axiom.

The axioms of Euclid are very general propositions, and we are the axioms of the Newtonian philosophy; but these two kinds of axioms have very different origins. The former appear true upon a bare contemplation of our ideas; whereas the latter are the result of the most laborious induction.
Lord Bacon, therefore, strenuously contends, that they should never be admitted upon any account, or even upon the authority of the learned; but all, as they are the general principles and grounds of all learning, should be considered and examined with the most liberal attention, "ut acrus acturus conscribat iniquitas, quandam in exemplis audacia indefinitionem datur.

De Aug. sect. 1, c. 2.

"Atque illa a sopatia principia et axioms secundas compulerem decretivas, quoniam plane contraria." Diocres. Opus.

A writer (see Thothams's Chart and Scale of Truth) distinguishes between Connotation and Suggestion. The former he says, passes through the fall of knowledge, and is direct; the latter, which is conceived on the minds of external objects do on the senses, are called; in the formation of the latter, each judge by single comprehension, without the aid of a third idea or middle term; so that they have their evidence in themselves, and though hypothetically framed, they cannot be logically proved. If we admit this distinction, and its reasonable limits must be allowed, the character of intuitive axioms will be referred to particular truths. See Induction, Reasoning, and Syllogism.

AXION, in Rhetoric, is used by Hermogenes to denote grandeur, dignity, and sublimity of style. AXIOPOILIS, in Ancient Geography, is a town of Lower Moors, according to Ptolemy, situated near the part where the Danube assembled the name of Tiber, north-east of Dacia.

It is now a town of European Turkey, in Bulgaria, called Alexopolis, on the right bank of the Danube. N.B. 45° 45'. E long. 34°.

AXIOM, a form of acclamation, anciently used by the people in the election of bishops. When they were all unanimous, they cried out: 

"Axiom a timere, he is worthy, or axi, worthy by.

AXIOM, in Rhetoric, denotes a third part of an exordium; sometimes also called axi, and containing some new proposition more nearly relating to the matter in hand, than the axi.

Thus, in Cicero's oration pro Milone, the problem is:

"Non possum non timere, judices, vili habeas novitiam formas," the auth. says, "Nec enim ex corona confidet vel verus cuivis quae folletur," the auth. says, "Sed me necet Pompeius, cuius furor nos fecavit, quem instanti judicium tradidit, teh mihi reformat," the auth. says, "Quam obrem addes animo, judices, & timorem, si quern habebis, depositum,"

AXIOTEIA, in Biographia, a female philosopher of Greece, who lived in the time of Plato. Such was her thirst for knowledge, that she disguised herself in men's clothes, in order to attend the Lectures of that philosopher. She is in Diog. Laert. i. iii. c. 48.

AXIS properly signifies a line, or long piece of iron or wood passing through the centre of a sphere, which is moveable upon the same. In this sense we say, the axis of a sphere or globe; the axis, or axle-tree of a wheel, &c.

AXIS, in Anatomy, is the second vertebra of the neck, reckoning from the skull. It is thus called, because the first vertebra, with the head, move therein, as an axis. See Skeleton.

Axis, Spiral, in Architecture, is the axis of a twisted column drawn spirally, in order to trace the circumvolutions without. See Column, Twisted.

Axis of the Ionic capital is a line passing perpendicularly through the middle of the eye of the volute.

Axis of the world, in Astronomy, is an imaginary right line, which is conceived to pass through the centre of the earth, and to terminate at each end in the surface of the mundane sphere.

About this line as an axis, the sphere in the Ptolemaic system, is supposed to rotate. This axis is represented by the line PQ, Plate II., fig. 3. The two extreme points in the surface of the sphere, viz. 1 and 0, are called its poles.

Axis of the earth, is a right line upon which the earth performs its diurnal rotation from west to east.

Such is the line PQ, fig. 19. — The two extreme points are also called poles.

The axis of the earth is a part of the axis of the world. — It always remains parallel to itself, and at right angles with the equator. See Angle, Inclination, and Parallelism.

Axis of a planet, is a line drawn through its centre, about which the planet revolves.

The sun, Earth, Moon, Jupiter, Mars, and Venus, are known, by observation, to move about their several axes; and the like motion is easily inferred of Mercury, Saturn, and the Heavenly bodies.

Axis of the horizon, equator, ecliptic, colure, &c. are right lines drawn through the centres of these circles, perpendicular to their planes.

Axis, in Geometry, a taper column placed in the centre of a figure, or any figure, about which the other parts are disposed. It is a perpendicular line.

Thus a sphere is conceived to be formed by the rotation of a hemisphere about its diameter or axis, and a right cone by that of a right angled triangle about its perpendicular leg, which is here its axis.

Axis is yet more generally used for a right line proceeding from the vertex of a figure to the middle of its base.

Axis of a circle or sphere, is a line passing through the centre of the circle or sphere, and terminating at each end in its circumference.

The axis of a circle, &c. is otherwise called its diameter.

Axis of a right or Cylindrical cylinder, is properly that line, which is perpendicular to the axis of the cylinder, about which the rectangular parallelogram turns, by whose revolution the cylinder is formed.

In general, the right line which joins the centres of the opposite bases of cylinders, whether they be right or oblique, is denominated their axis.

Axis of a right cone, is the right line or side upon which the right-angled triangle forming the cone makes its motion. Hence it follows, that only a right cone can properly have an axis; because an oblique cone cannot be generated by any motion of a plane figure about a right line at right, but because the axis of a right cone is a right line drawn from the centre of its base to the vertex; the writers of cones, by way of analogy, like, because the like line drawn from the centre of the base of an oblique cone to the vertex, its axis.

Axis of a conic section, is a right line passing through the middle of the figure, and bisecting all the ordinates at right angles.

Thus if AP (Plate, Conics, fig. 31.) be drawn perpendicularly to FF, so as to divide the section into two equal parts, it is called the axis of the section.

Or, the axis of a conic section is a line drawn from the principal vertex, or vertices, perpendicular to the tangent at that point.

Axis, transverse, called also the first or principal axis of an ellipse,
ellipse, is the axis AP, last defined; being thus called in contradiction to the *conjugate* or *focal axis*.

Or, in the ellipse and hyperbola, it is the diameter that passes through the two foci, and the two principal vertices of the figure.

The transverse axis in the ellipse is the longest; and in the hyperbola it cuts the curve in the points A and P (fig. 32.) and is the shortest diameter.

**Axis, conjugate, or focal axis**, of the ellipse and hyperbola, is the diameter passing through the centre and perpendicular to the transverse axis. Such is the line FE (fig. 31.) drawn through the centre of the ellipse C, parallel to the ordinate MN, and perpendicular to the transverse axis AP; being terminated at each extreme by the curve. And, in the hyperbola, it is the right line FE (fig. 32.) drawn through the centre parallel to the ordinates MN, MN, perpendicularly to the transverse axis AP. In the ellipse and hyperbola, the conjugate axis is the shortest of all the conjugate diameters. The axis of a parabola is of an indeterminate length; that is, it is infinite. The axis of the ellipse is determinate. The parabola has only one axis; the ellipse and hyperbola have two.

**Axis of a Curve Line**, in general, denotes that diameter which has its ordinates at right angles thereto, when that is possible. For, as in the conic sections, any diameter divides all its parallel ordinates, making the two parts of them on both sides of it equal, and the diameter which is perpendicular to such ordinates is an axis; and in curves of the second order, if any two parallel lines meet with the curve in three points, the right line which cuts these two parallels so that the sum of the two parts on one side of the intersecting line, between it and the curve, is equal to the third part terminated by the curve on the other side, then the said line will in like manner cut all other parallels to the former two lines, so that with respect to every one of them, the sum of the two parts, or ordinates, on one side, will be equal to the third part, or ordinates, on the other side. Such intersecting line is then a diameter; and that diameter, whose parallel ordinates are at right angles to it, when that is possible, is an axis. The centre is the same with regard to other curves of still higher orders. Newton, Enumeratio Linearum Tertii Ordinis, § 2, art. 1.

**Axis of a Magnet, or Magnetical Axis**, is a line passing through the middle of a magnet lengthwise; in such manner, as that however the magnet be divided, provided the division be made according to a plane, in which such line is found, the magnet will be cut or separated into two half-magnets; and the extremities of such lines are called the poles of the line. See MAGNET.

**Axis, in Mechanics.** The axis of a balance is the line upon which it moves or turns. See BALANCE.

**Axis of Oscillation.** is a right line parallel to the horizon, passing through the centre, about which a pendulum vibrates; and perpendicular to the plane in which it oscillates. See OSCILLATION, and PENDULUM.

**Axis in Peritrochosis, or Wheel and Axis.** is one of the five mechanical powers, or simple machines, contrived chiefly for the raising of weights to a considerable height. It consists of a circle, represented AB (Plate 1, Mechanics, fig. 5.) concentric with the base of a cylinder, and moveable together with it, about its axis EE. This cylinder is called the axis; and the circle, the *peritrochoid*; and the radii, or spokes, which are sometimes fitted immediately into the cylinder, without any circle, the *rotula*. Round the axis winds a rope, or chain, by means of which the weights, &c. are to be raised, upon turning the wheel.

The axis in peritrochosis takes place in the motion of every machine, where a circle may be conceived as described about a fixed axis, concentric to the plane of a cylinder, about which it is placed; as in crane-wheels, mill-wheels, capstans, &c.; a gambrel and an ancre to bore with may also be referred to the wheel and axis.

**Axis in Peritrochosis, properties of the.**

1. If the power applied to the axis peritrochosis, in the direction AL (fig. 6.), being a tangent to the periphery of the wheel, or perpendicular to the level or spoke, be to a weight W, as the radius of the axis CE is to the radius of the wheel CA, or the length of the spoke; the power will just sustain the weight, W; the weight and the power will be in equilibrium.

2. If the power applied to the axis peritrochosis, be to a weight W, as the radius of the axis CE is to the radius of the wheel CA, or the length of the spoke; and the power be the same as the weight; then there will be an equilibrium, when P : W :: W's distance from the centre of motion, or radius of the axis ; radius of the wheel. Or, since the directions of P and W are perpendicular to their respective distances from their centre of motion, they are wholly efficient; and P's velocity is to W's velocity, as the periphery of the wheel to the periphery of the axis; and consequently, when there is an equilibrium, P : W :: periphery of the axis : periphery of the wheel :: radius of the axis : radius of the wheel.

3. The thickness of the rope, to which W is appended, be not inconsiderable, it ought not to be neglected; for when one or more coils or spares of the rope are folded about the axis, the distance of W's direction from the centre of motion is increased, and becomes equal to the sum of the semi-diameters of the axis and ropes; and there is an equilibrium when P : W :: the whole distance of W's direction from the centre of motion : radius of the wheel.

4. A power applied in F, pull down the wheel according to the line of direction FD, which is oblique to the radius of the wheel, though parallel to the perpendicular direction; it will have the same proportion to a power which acts according to the perpendicular direction AL, to which the whole line has to the line of the angle of direction DFC. For, since FD is perpendicular to AC, DC will be the distance of the power applied at F from the centre of motion; consequently the power at F : W :: EC : CD; and the power at A : W :: EC : CA; consequently the power at F : power at A :: CA : CD: But if CA or FC be taken for the whole fine or radius, CD will be the line of the angle DFC; and the power at F will be to the power at A :: the whole fine is to the fine of the angle of the direction DFC, in case of an equilibrium between the power and weight.

Hence, since the distance of the power in A is the radius CA, the angle of direction DFC being given, the distance DC is easily found.

5. Powers applied to the wheel in several points, F and K, according to the directions FD and Kl, parallel to the perpendicular one AL, are to each other as the distances from the centre of motion CD and CI, reciprocally. For the power at F : W :: EC : CD; and the power at K : W :: EC : IC; consequently the power at F : power at K :: IC : CD.

Hence, as the distance from the centre of motion increases, the power decreases, and vice versa, the weight being the same. Hence also, since the radius AC is the greatest distance, and corresponds to the power acting according to the line of direction; the perpendicular power will
will be the smallest of all those able to sustain the weight W, according to the several parallel lines of direction.

4. If a power acting according to the perpendicular AL, raise the weight W, the space passed through by the power will be to the space passed through by the weight, as the weight to the power which is able to sustain it.

For in each revolution of the wheel, the power passes through its whole periphery; and in the same time the weight is raised through an interval equal to the periphery of the axis; the space of the power therefore is to the space of the weight, as the periphery of the wheel to that of the axis; but the power is to the weight, as the radius of the axis to that of the wheel. Therefore, &c.

5. A power and a weight being given, to construct an axis in rectrochisis, by which the weight shall be sustained and raised by the given power. Let the axis be large enough to support the weight without breaking. Then, as the weight is to the power, so make the radius of the wheel, or the length of the spoke, to the radius of the axis.

Hence, if the power be but a small part of the weight, the radius of the wheel must be vastly great. — Ex. gr. Suppose the weight 4950 and the power 50, the radius of the wheel will be to that of the axis as 81 to 1. But such a machine would be of an inconvenient size; and it may therefore be provided against by increasing the number of the wheels and axes; and making one to turn round another by means of teeth or pinsions.

To find the effect of a number of wheels and axes, thus turning one another, multiply together all the radii of the axes, and all the radii of the wheels, and then it will be, as the product of the former is to the product of the latter, so is the power to the weight. Thus, if there be four wheels and axes, the radius of each axis being one foot, and the radius of each wheel being three feet; then the continual product of all the radii of the wheels is 3\times3\times3\times3, or 81 feet; and that of the radii of the axis only is; consequently the effect is as 81 to 1, or the weight may be 81 times the power. On the contrary, if it be required to find the diameter of each of four equal wheels, by which a weight of 4950 lb. shall be balanced by a power of 50 lb. the diameter of each axis being one foot; divide 4950 by 50, and the quotient is 81; extract the fourth root of 81, or twice the square root, and it will be 3, for the diameter of each of the four wheels sought. See WHEELS. See also MECHANICAL POWER.

6. If P and W act in the same plane, and in the directions PD and WD (fig. 7 and 8.), meeting in D, and be in equilibrium, they are equivalent to a third force, or prejine upon the axis at A, whose direction meets PD and WD in D (see Motion); and producing PD, WD, these three forces are to each other, as the sides DF, DE, and diagonal DG, of the parallelogram EF; consequently P : W :: DF : DE, or drawing AN, AM, perpendicular to WD and DP, respectively, P : W :: AN : AM. See LEVER.

7. The prejine upon the axis at A (i. e. Pr.) : P :: DG : DF :: sin. \angle DGF or PDW : sin. \angle FGD or ADW : Pr. : W :: DG : DE :: sin. \angle DEG or PDW : sin. \angle DGE or ADP, and P : W :: sin. \angle ADW : sin. \angle ADP.

Axis of a Vessel, is that quiescent right line passing through the middle thereof, perpendicularly to its base, and equally distant from its sides.

Axis, in Optics. Optic axis, or visual axis, is a ray passing through the centre of the eye; or it is that ray, which, proceeding through the middle of the luminous cone, falls perpendicularly on the crystalline humour, and consequently passes through the centre of the eye.

Axis, Common, or Mean, is a right line drawn from the point of concourse of the two optic nerves, through the middle of the right line which joins the extremity of the same optic nerves.

Axis of a Lens, or Glafs, is a right line passing along the axis of that solid, of which the lens is a segment.

Thus, a spherical convex lens being a segment of some sphere, the axis of the lens is the same with the axis of the sphere; or it is a right line passing through the centre thereof. Or, the axis of a glafs is a right line joining the middle points of the two opposite surfaces of the glafs. See LENS.

Axis of Incidence, in Dioptrics, is a right line drawn through the point of incidence, perpendicularly to the refracting surface. See INCIDENCE.

Axis of Refraction, is a right line continued from the point of incidence or refraction perpendicularly to the refracting surface, along the farther medium. Or, it is that made by the incident ray, perpendicularly prolonged on the side of the second medium. See REFRACTION.

Axis, in Zoology, a species of the Cervus, or Stag genus, with branched, round, erect horns, that are biisp at the summit; and the body spotted with white. Erxleb. Mamm. p. 312. Schweber, &c.

The axis, according to Sonini and others, is an animal almost peculiar to the colder parts of Asia; it inhabits the wooded mountains of the Celebes, Java, and Ceylon, in great numbers, but it is still more abundant on the banks of the river Ganges, and for that reason is not unfrequently called the Ganges flag. The axis multiplies fall in the parks and menageries of England, France, and other parts of Europe; and being a most graceful animal, is no small ornament to the grounds of the nobility and gentry. It is said to propagate with the female of the common flag; and it is equally probable, that the female axis would produce with the male of the other kind.

This animal was known to the ancients by the name of axis. Pliny speaks of it as a native of India, and informs us likewise that it was consecrated to Bacchus. Its size is nearly that of the fallow deer; colour above pale rufous brown, elegantly spotted with white, beneath white; tail like that of the fallow deer, and rufous above, and white beneath. The axis is easily tamed; its smell is exquisite; and flesh very good when salted.

Gmelin, on the authority of Pennant, speaks of two varieties of this creature: the first, with a body uniformly of one colour, with the extremity of the horns trifurcated; and the other with horns that are also trifurcated, but larger, and whiter. These are the middle axis and spotted axis of Dr. Shaw; and are thus noticed in the Gen. Zool. of that author — "Middle axis. Whether this be a variety of the former (spotted axis), or specifically distinct, does not appear perfectly clear. It is, according to Mr. Pennant, of a middle size between the spotted axis and the great axis or following kind. In the colour of its hair, it resembles the first sort; but is never spotted. It, however, is liable to vary into white, in which state it is considered as a great rarity. It inhabits dry hilly forests in Ceylon, Borneo, Celebes, and Java, where it is found in very numerous herds. Its flesh is much esteemed by the natives, and is dried and salted for use."—"Great axis. The existence of this species, or variety, is ascertained from a pair of horns in the British Museum, resembling the former kinds in shape, but of a larger size;
they measure two feet nine inches in length, are of a white
ish colour, and are very strong, thick, and rugged. Mr.
Pennant conjectures that they were brought from Ceylon
Borneo, having been informed by Mr. Lenten, who had
long resided in the former of these islands, that a very large
kind of flag, as tall as a horse, of a reddish colour, and
with trifurcated horns, existed there as well as at Borneo.
In Borneo, they are bred to frequent low marshy places, and
to be called by the name of water flags."

AXUS, now VARNA, in Ancient Geography, the larg-
est river in Macedonia, springing from two fountains in the
Scardian mountains, and after a course of eighty miles,
spreads itself into an extensive lake below the city of Eud refusal.
There receiving the Erêna, it falls into the bay of Thrus-
lonica, almost opposite to that city. — Also, a river of Syria,
which passed Apamaea.

AXLE-Tree. See Axis.

AXMINSTER, spelt in old writings AXMISTER, in
Geography, is the name of a market town in Devonshire,
situated on the great leading road from London to the
West of England. It is said to derive its name from the river
Ax, on which it is situated, and a minster, founded here by
king Athelstan, for seven priests, who were appointed to pray
for the souls of some of his army that were slain in a dread-
ful conflict with the Danes. A place in the neighbourhood
is still called King's-bells, and another place bears the name
of Kirkington, from Kilmenster. A castle was formerly
standing in the town; and the market, held on Saturday,
is kept in a place still bearing that name. Whatever fice or
character the minster might originally possess, it has been
nearly destroyed; and the parish church, though large, has
fearfully any appearance of antiquity. A small Saxen arch,
with zigzag mouldings and appropriate capitals, is preserved
in the east end of the south aisle. Axminster is a healthy,
clean town, pleasantly situated on rising ground, which
shades on the western side to the river. A considerable ma-
ufactory of carpets is carried on here, the peculiar make
and character of which have obtained them the name of
Axminster carpets. They are woven in one entire piece,
and several persons are employed at the same time in work-
ing the coloured patterns. The manufacture was first es-
blished here in 1755, by the grandfather of the present pro-
pietor. Since that time the trade has much increased, and
now above one hundred hands are constantly employed in
the different processes of making a carpet. (See Carpet.) Be-
side the perfections engaged in this manufacture, Axminster
is inhabited by several others, who carry on the making of broad
and narrow cloths, cotton tapes, druggets, leather breeches,
and gloves. Here are two meeting houses, one for Independ-
ents, and the other for Methodists; also a Roman Catholic
chapel. Axminster has the advantage of a Sunday school,
and also a free school. The neighbourhood is adorned with
several respectable and handsome manor-houses, of which Stute
House and Ford Abbey are the most considerable. The first
belongs to the De La Poole family, and the second to Fran-
cis Gwynn, esq. This is a large respectable structure, many
parts of which are the same as originally belonged to the
p. 258; and Beauties of England and Wales, vol. iv.

AXOLOTI, in Ichthyology, a singular fish found in
the lake of Mexico. It has four feet like the lizard, no scales,
a mouth like a woman, and the menstral flux. It has the
taste of an eel.

AXON, in Ancient Geography, a river of Asia Minor, in
Caria, formed by the reunion of two small streams, and
running south from the town of Calyda, discharged itself
into the north-west part of the gulf of Glauceus, to the
north-west of the monastery of Pedailum.

AXONA, a river of Belgic Gaul, now the Aisne.
AXUM, in Geography, once the large and populous
capital of Abyssinia, in the province of Tigre, existed in
a flourishing state for a long time, at the beginning of the 6th
century, but was ruined in that century by the Turkish
invader. It is now a village, or at least an inn, inhabi-
ted town, exhibiting in its ruins traces of its ancient magni-
tude and importance. The ancient city of Axum was
built, according to Mr. Bruce, by a colony of Cushites,
and he cites an Abyssinian tradition, which says, that it was
built by them early in the days of Abraham. See AY-
sinia. As the Abyssinians never built any city, and no
ruins of any exist at this day in the whole country, this
traveller conceives, that Axum was the magnificent metrop-
olis of the trading people, or Troglodyte Ethiopians,
called Cushites, who constructed, in many places, buildings
of great strength, magnitude, and expense, especially at
Axin, suitable to the magnificence and riches of a state,
which was from the first ages the emporium of the
Indian and African trade. As Axum is situated about
midway between Abyz and Meroe, it points out the road
taken by the caravans that passed between the Ganges and the
Mediterranean. The ruins of Axum are very extensive; but like those of the cities of
ancient times, they consist altogether of public buildings.
In one square, supposed by Mr. Bruce to have been the
centre of the town, there are forty obelisks, none of which
have any hieroglyphics upon them. One of these, which is
still standing, is larger than the rest; and there are two
of a larger size that are fallen. They consist in one piece
of granite; and on the top of that which is standing,
there is a patera exceedingly well carved in the Greek taste.
The structure of this obelisk, and of the two larger that are
fallen, is ascribed by Mr. Bruce to Ptolemy Euergetes.
Upon the face of the obelisk, there is a great deal of carv-
ing in the Gothic taste, somewhat like metopes, triglyphs,
and guttae, disposed rudely and without order; but there
are no characters, or figures. The face of this pyramid, of
which Mr. Bruce has given a geometrical elevation, looks
deepest; it has been placed with great exactness, and
has preserved its perpendicular position to the present
time. On the face, forting the south, is the representation
of a door, with a lock and bolt, such as are used at this day
in Egypt and Palestine. This obelisk is supposed to have
been erected by Ptolemy Euergetes, who conquered this
city and the neighbouring kingdom, and who was the pa-
tron of Eratosthenes, for the use of this astronomer in
ascertaining the latitude. It was first cut into a nar-
row mass, then spread out like a fan in a semicircular form,
with a pavement curiously levelled to receive the flake,
and to mark the separation of the true shadow from the
penumbra as distinctly as possible. The edifice, thus con-
structed, was probably intended for verifying the ex-
periments of Eratosthenes with a larger radius, and not for
observing the obliquity of the ecliptic at Axum. For
though Axum, by its situation, was a very proper place,
the path lying over that city and obelisk twice a year;
but he could not make use of the sun's being twice vertical
to this city, because it is vertical about the 25th of April and
about the 25th of August; but at those times, the
heavens are so overcast with clouds, and the air so con-
tinual, especially at noon, that it must have been very ex-
traordinary if Ptolemy had once seen the sun during the
months of his residence in this place. Beyond the convent
of Abba Pantaleon, and a small obelisk erected on a rock,
above
above, there is to the south a road cut in a mountain of red marble, having on the left a parapet wall about five feet high, solid, and of the same materials. In this wall, at equal distances, are heavy solid pedestals, bearing on their tops the marks where stood the colossal statues of Sirius, the Harroun abu, or dog-star. Of these pedestals, with the marks of the statues put mentioned, there are 133 hill in their places; but there remained only figures of the dogs, which were much mutilated, and evidently in the Egyptian taste. These are composed of granite; but none of them appeared to Mr. Bruce to have been metal. There are also pedestals, on which the figures of the fabius have been placed. Two magnificent flights of steps several hundred feet long, all of granite, exceedingly well fashioned, and hill in their places, are the only remains of a magnificent temple. In the angle of this platform, where the temple stood, is the present small church of Axum, sublimated for one destroyed by Mahomet Gracq in the reign of king David III., and which was probably the remains of a temple built by Publey Emergetes, if not the work of more remote times. The church is a mean, small building, and very negligently kept. Mr. Bruce apprehends, that some ancient copy of the O. T. was deposited here, probably that from which the first version was made; but whatever it might be, it was destroyed, together with the church itself, by Mahomet Gracq; though the superstitious people have a tradition that it still subsists there. Another relic, preserved in this place, is a picture of Christ's head crowned with thorns, laid to have been painted by St. Luke, which, upon occasions of singular importance, is brought out and carried with the army, especially in a war with Mahometans and Pagans. Within the outer gate of the church are three small square inclosures, all of granite, with small octagon pillars in the angles, apparently Egyptian; on the top of which were formerly small images of the dog-star, probably of metal. Upon a rose, in the middle of one of these, the king sits and is crowned, and this ceremony has always subsisted since the days of Paganism; and below it, where he places his feet, is a large oblong slab of free stone; bearing the following inscription, much defaced,

"ITTOHEMATOF ETMETOT BAXAEON."

Adjoining to Axum is a road, formed by large stones. Rounding edgeways, or heaped upon one another, which is apparently the remains of an old causeway, part of the magnificent works about this city.

The present town of Axum stands at the foot of a hill, and contains about 600 houses. It is watered by a small stream, which flows constantly from a fountain in the narrow valley, where the rows of obelisks stand. The spring is received into a magnificent basin, 150 feet square, and thence it is carried, at pleasure, to water the neighbouring gardens, where there is little fruit, except pomegranates, which are not very excellent. In the town are several manufactures of coarse cotton cloth; and here also the best parchment is made of goats' skins, which is the ordinary employment of the monks. Every kind of vegetation seems later at Axum, and its vicinity, than at Adowa. N. lat. 14° 6' 30". E. long. 38° 39'. Bruce's Travels, vol. III. p. 128, &c.

AXUNGLIA, a kind of fat, the hardest and driest of any in the bodies of animals. The word is supposed to be formed of one root word geunun+, from its being used as the grease of wheels. The Latins distingued it into plagaeat, and adpe+, or fexus; which last, when old, is particularly called axun-gis; but many of our modern writers confound them. Physicists make use of the axungla of the goats, the dog, the viper, and some others, which is held by some to be of extraordinary service in the drawing and ripening of tumours, &c.

AXUNGLA of Glufs, called also the gall, and salt of glufs, is a salm taken from the top of the matter of glufs before it be thoroughly vitrified. It is used in cleansing the teeth, and by barbers for clearing the eyes of horses.

AYXLOX, in Ancient Geography, a country of Asia, toward Syria and Carthage. 

Species, 1. A. ammonite, simple spiked axyris. Gmel. h. 3. 21. t. 2. f. 2. and t. 3. "Leaves ovate, stem erect, spikes simple." Leaves rough, with foliaceous hairs: fruit-bearing branches, naked at the base; spike very small, subculiform, quite simple, terminal. It is observed by Gmelina, that the small axyris flower is two or three-leaved. Cultivated by Miller in 1758. 2. A. hybridus. Gmel. i. c. "Leaves ovate; stem erect; spikes conglomorate." This differs from the first, in the spike of flowers being on long peduncles, conglomerate, or directed the same way, twisted, with the fruit-bearing branches crowded close to the stem, and the leaves more rough. Pallis suffusostis is to be only a variety of the former plant. According to Gmelina, the calyx is three-leaved, and there is but one leaf in the female flower.

3. A. pyriformis. Gmel. i. c. "Leaves obovate; stem sub-divided; flowers headed." Stem much branched, fix or seven inches high; leaves on stalks; flowers at the ends of the branches, conglomerate, with numerous leaves among them. The female calyx as also three leaves according to Gmelina. All these are annual plants, and natives of Siberia.

AXYRIS Ceratinoides now constitutes a new genus, under the name Doit., which see.

AYY, in Geography, a town of France, in the department of Marne, and chief place of a canton in the district of Rheims, seated on the Marne; famous for its good wines; four leagues south of Rheims, and one N.E. of Epernay. The place contains 2583 and the canton 11550 inhabitants; the territory includes 180 kilometres and 22 communes. N. lat. 49° 1'. E. long. 2° 15'.

AYY, Pulo, one of the Bandar islands, in the Indian sea, about three leagues in circumference, where the Dutch have erected a fort.

AYAG, or Kayachu, one of the Andracosfie islands, in the Eastern or Pacific Ocean, about 150 versts in circumference, and consisting of several high and rocky mountains, the intervals of which are bare heath and poor ground; but in the whole island, there is not one forest tree. The vegetables resemble those of Kameretah. It furnishes small quantities of crow or crake-berries, and the larger sort of bilberries; but of the roots of beet and all kind of indueed, such abundance as to afford, CAFE of necessity, a plentiful provision for the inhabitants. There is one main rivulet; and there are many good bays and anchoring places. The population cannot be precisely ascertained, as they are continually emigrating from island to island in their baidars.

AYAMONTE,
AYAMONTE, a sea-port town of Spain, situate at the mouth of the Guadiana, on the frontiers of Portugal, with a good haven in the gulf of Cadiz; small, but well fortified, and defended by a castle on a rock; 53 miles W. S. W. of Seville. The adjacent vineyards are fruitful, and the wine excellent. N. lat. 37° 13'. W. long. 8° 5'. See Aimaonte.

AYAMS, derived from an Arabic word which signifies eyes, a name given to a class of officers in the provinces of the Ottoman empire, whose business it is to watch over the safety and the fortune of individuals, and also over the good order and defence of a town; to refrain the unjust enterprises of the pachas, and the exactions of the military, and to concour in the just affluence of the taxes.—Appointed by the people, those who undertake this honourable function, are generally men reputed the most virtuous; there are several of them in the great towns, and a single person superintends several villages in the plains. They receive no other recompense for their trouble and zeal, than the respect with which they are treated, and the satisfaction of being useful. The Ayams call to their divan the notables of the town and the lawyers, in order to discharge the most important subjects, to digest the remonstrances that are proper to be made to the pachas, and to establish the grounds of those complaints which they judge necessary to be presented against him to the Porte. Olivier's Travels in the East, p. 200.

AYBAR, in Geography, a town of Spain, in Navarre, on the river Aragon; one league from Sangües. See Aybed.

AYBED, a place of Egypt, on the coast of the Red Sea, where the merchandises of Africa were landed.

AYBLING, a town of Germany, in Upper Bavaria, twenty six miles S. E. of Munich.

AYCHA, a town of Bohemia, in the circle of Bohma; fifteen miles north of Jurgenthal.

AYDHAB, a place of Africa, in Egypt, on the coast of the Red Sea. N. lat. 21° 53'. E. long. 36° 25'. See Andrab.

AYE, a town of Norway, in the island of Shetney.

AYE-AyE, in Zoology, a singular quadruped discovered by Sonnerat, in the island of Madagascar; and described in his voyage to the East Indies (tom. ii. p. 137). The name appears to have no precise meaning; it is an exclamation of the people of Madagascar, and which M. Sonnerat applied to this animal. It is found chiefly, if not exclusively, on the western side of the island.

In size the creature is equal to a rabbit, measuring in a right line from the muzzle to the origin of the tail, fourteen or fifteen inches, and the tail being rather longer than the body. The head is formed like that of a squirrel; the incisive teeth are very contiguous, and so placed as to resemble in some manner, the back of a parrot; but the two in the lower jaw are much stronger than those in the upper one. The ears are naked, large, and rounded at the tip, as in several of the bat tribe. The toes on each foot are five in number; and the first or innermost one, which serves as a thumb to the hind feet, has a large and flat nail as in the maitoe tribe (maceo, or lenur). A very distinguished character of this animal is the length of the toes on the forefeet; the twoJoint points of the middle toe above all are very long, slender and delicate of hair, and the nails are hooked.

The fur is as coarse as horse-hair; and is of a purplish, or mahogany-brown colour, intermixed with black and grizzled ash, upon the head, and back, about the eyes, legs, and thighs, is a deep mottled-colour; on the eyelids, and several parts of the body and limbs, black however predominates, and the tail is of this latter colour; that of the face, throat, and belly is greyish white, or slightly tinged with rufous in some places; it does not carry the tail elevated like a squirrel. The female has two teats on the lower part of the belly.

M. Sonnerat, who saw both the male and female, speaks of them as being very florish and gentle animals; and which, like the owls, are scarcely able to discern objects in the day time. They live chiefly under ground, feeding on worms and insects which they find in the earth, or in crevices in the trunks of trees, from whence they extract them with the greatest facility, by means of their long slender toes before mentioned. Tho' which Sonnerat kept alive, were served with rice, and he observed that they fed themselves with the two long toes of their forefeet, in the same manner as the Chinese do with their chop-sticks when eating rice at their meals.

Sonmini forms a new genus of this animal, under the name of Chironyx (or rat a main), observing that it is the only species of its genus known. The generic character, according to this author, consists in the toes being very long, and the thumb of the hinder pair being bent aside, or turning rather backwards. He confers Mnihius for calling it feirinu Madagascarius or Madagascar squirrel, because a quadruped of that genus really exists in Madagascar. —Mnihius thus specifically describes his S. Madagascaricus; middle toe of the fore-feet naked, and very long; thumb nail of the hind-pair rounded.

AYE-L., Fr. or Ayve, in Law, a writ which lies where the grandfather was seise in his demesne on the day he died, a stranger enters the same day and dispossesses the heir. See Assise de Mort, &c.

AYEN, in Geography, a town of France, in the department of the Corrèze, and chief place of a canton in the district of Brive; fourteen miles N.S.W. of Uzerche. The place contains 935 and the canton 8592 inhabitants; the territory includes 1372 square kilometres and 12 communes.

AYEÑA, in Botany, (named in honour of the duke D'Ayen, duke and marquis de Nueilles). Linn. p. 1520. Schreb. 357. Gartn. 79. Jaff. 258. Claffs, gynandria pentandra; or, according to Schreber, pentandra monogynia. Nat. Order of communes.—Malvañae, Jaff. Gen. Char. Cal. perianth one-leafed, five parted; parts ovate, oblong, acute, coloured in the middle, reflex, withering. Cor. five-leaved, united at the top to the nectary into a flat flar; claws of the petals capillary, very long, bowed outwardly; borders obsolete, reflexuate, with clubbed tips turned upward; nectary bell-shaped, fitting on a cylindrical, erect column, shorter than the calyx; border five-lobed, lobes elevated; above flattish, with a longitudinal furrow, excentric underneather, shafpy. Stem. filaments five, very short, inserted into the margin of the nectary, on the top of the ribs, between the divisions of the border, each bent downwards through a notch at the end of each petal; anthers roundish, under the borders of the petals. Per. germ roundish, five-corned, at the bottom of the nectary; flake cylindrical; ligula obtuse, five-lobed. Per. capsule five-ribbed, roundish, mucratic, five-celled, ten-valved, clafhich. Seeds follicular, rather oblong, gibbous on one side, angular on the other.

Species, 1. A. pulzla; smooth ayenia. Mill. Dict. fig. 1. 18. "Leaves cordate, smooth." Stem weak, woody, from nine inches to a foot high; leaves alternate, indented, pointed, flaked; flowers at the base of the pistils, two, three, or four, from the same point, on separate peduncles; corolla purple, tubulous, spreading at the top into five segments, each terminated by a slender tail. A native of Peru. Cultivated by Miller, in 1756. Its flowers appear in succession from July till winter. 2. A. tenomenta. "Leaves ovate,
AYE

AYL

owate, roundish, tomentose." Leaves of the caydia lanceolate, acute, permanent; corolla without petals, but composed of a one-seed bell-shaped nectarary, with a five-leaf margin; itamea on the outside of the nectarary, longer than the caydia, bowed, bent in, and fixed by a broad membranous tip, to the edge of the nectarary; anthers three. A native of South America. 3. A. mucronata. Jacq. Amer. Pict. p. 112. "Leaves corymbous pendent; germ of the flowers feblate." An upright shrub five feet high; leaves acuminate, serrate, alternate, tomentose; flowers short, axillary, mostly in four; three-flowered; flowers small, herbaceous, not gynandrous. A native of Carthagena and other places of South America. 4. A. lineata. Swartz. Prod. 97. "Leaves ovate, entire, very smooth, germ pedicellate, nectarary ten-leaf, radiate." A native of Jamaica.

Propagation and Culture. These plants are to be propagated by seeds sown on a temperate hot-bed, early in the spring; and when they have four leaves, they should be transplanted in another hot-bed to bring them forward, or in pots, and plunged into a hot-bed of tanner's bark. They must be flaked till they have taken root, and afterwards have free air admitted to them every day in proportion to the warmth of the season; they also require frequent watering. In winter they may be preferred in a moderate fire, but as they perfect their first year, it is not necessary to continue the old plants. See Martyn's Miller's Diet.

AYENNIS, in Geography, the name of an Indian tribe of America, in Florida.

AYERBA, a town of Spain, in Arragon, on the Gallego, between Saragossa and Jaca.

AYERBENGAI, a town of the island of Sumatra.

AYERSTOWN. See AYERTOWN.

AYERSTOWN, in Geography, the favourite wife of Mahomet, was the daughter of Abubeker, and the only one of Mahomet's numerous wives who was a virgin when she came to his bed. With this view, he married her at seven years of age, and cohabited with her at nine. He had no children by her; but so affectionate and constant was his attachment to her, that in his last illness he was conveyed to her house, and expired in her arms. Her enemies charged her with adultery on a particular occasion; and though the prophet had suspicions of her infidelity, he thought it most prudent, for preserving the dignity of his own character, to produce a fea-lonable revelation from heaven, attesting her innocence; and he punished her accusers as calumniators. After the death of Mahomet, Ayenina was held in great veneration by the Mussulmans, denominated "the mother of the faithful," and confounded on important occasions. Against the caliph Othman she conceived, for some reason that is not known, an invincible prejudice, and formed a plot for de-throning him. When Othman was assassinated by another enemy, she vigorously opposed the succession of Ali, because he had concurred in the accusation of her infidelity. Unit-ing with her favourites Telha and Zobeir at Mecca, and under a pretence of avenging the murder of Othman, she marched in a litter borne by a very strong camel, at the head of an army, towards Bassora, and on approaching the town, after force ineffectual resistance on the part of the in-habitants, she was met by a delegation sent to know her intentions, whom she harangued with great passion, and in a loud shrill voice, in a long speech. To her speech one of the Arabs replied, "O mother of the faithful, the murder of Othman was a circumstance of less moment than thy leaving home upon this cursed camel. God has bestowed on thee a veil and a protection; but thou hast rent the veil, and set at nought the protection." After some contfl, the troops of Ayenina gained possession of Bassora. But Ali advanced, and as Ayenina obstinately rejected all pacific counsels, a fierce battle ensued at a place called Horabbs, in which both Tellah and Zobeir were slain. The combat closed with harnftring the camel on which Ayenina was carried, and taking her prisoner. After some mutual reproaches between her and Ali, she was civilly dismissed, and went to Medina with an injunction to live peaceably at home, and to confine herself no more in affairs of state. This re-striction she afterwards rejected by refusing to suffer Hafan, the son of Ali, to be buried near the tomb of the prophet, which was her property. Having regained some degree of influence in the reign of the caliph Moawiya, she was con-firmed in the possession of her son Yezid. Soon after, she died, in the 58th year of the Hegira, A.D. 677, at the age of 67 years. Mod. Un. Hist. vol i. Her-dlot Bib. Or. p. 75.

AYGULA, in Zoology, a species of Simia, characterized by Linnaeus as the long-tailed, beardless, grey monkey, with a riling longitudinal tuft on the crown; the simia nigra magnitudinis medicei of Edwards; sigretta of Buff-ton; and egret monkey of Pennant. Linnaeus mentions an animal, apprehended to be a variety, with a roundish head, the face dark black, and the colour of the body less ferruginous. Mr. Pennant describes the egret as having a long face, and an upright pointed tuft of hair on the top of the head, hair on the forehead black; colour of the upper part of the body olivaceous; of the lower, chestrous; eyebrows large; beard very small; size of a small cat. It is said to inhabit India, and particularly the island of Java, and to be a very sportive and lively species; gamboling on the trees, and making a continual noise during the night. M. Cepede furnishes, that the ferrugineous monkey may perhaps be a variety of this species. Slav.

AYGULUS, in Entomology, a species of Scarabaeus, that inhabits India. Thorax with four dots; head tubercu-lated; wing-cases telfaceous; and no fore-tarsi. Fabricius.

AYLAH. See AILAM.

AYLESBURY, in Geography, is a large market and borough town in Buckinghamshire, in England; and may be considered the most considerable town in the county. It consists of several streets and lanes, which are irregularly disposed over an extensive surface of ground that rises in the midst of the rich vale of Aylesbury. Linnaeus describes the town as being principally built with timber when he visited it, but since that time it has been considerably enlarged and improved, and most of the houses constructed with brick. The improvements originated with Sir John Baldwin, who erected some considerable buildings, and raised a casemate three miles in length to facilitate the approach to the town through a road that was often miry and dangerous. This gentleman, in the time of Henry the eighth, also procured the affixes to be held here which had been before kept at Buckingham. In consequence of this, a county gaol, and also a handsome county hall, were erected. About the year 1600, Aylesbury became famous as the burial place of St. Olyth, who was born at Querendon in this neighbourhood, and beheaded in Essex by the Pagans. The burial place of a saint, in the dark ages of superstition, caused it to be much more frequented by sanctified enthusiasts, and Aylesbury became highly celebrated from this circumstance. Besides, the sisters Editha and Eadburga became palfessed of the manor, which after the conquest was given by the king to some of his favourites. The singular tenure, by which it was now held, serves to explain the customs of the times. This joined the lord of the manor to provide straw for the King's
King's bed and chamber, three cells for his sons in wait; and in summer, straw, rush, and two green geese, the every year of his visit at Stratford to the house. The chamber is a spacious and handsome room, built in the shape of a cross, with a low tower rising at the intersection of the nave and transepts. It contains a few ancient panellings, and on the south side is a room appropriated for a study. The church-yard is large, and divided into several walks, which are planted with double rows of trees. The tower was made a borough by charter, and empowered to send members to parliament on the 19th of January, 1559.

The right of voting is vested in all householders who do not receive ale, and their coopers and carriers. There are six annual fairs, at which the bulk of the trade is transacted; at the latter, great numbers of cloaks and shawls are sold to dealers from London. Many people in this town and its neighborhood derive support from their peculiar skill in breeding and rearing of ducks. To gratify fashionable luxury they contrive to prevent the ducks laying till the month of October and November; when, by heating and stimulating food they are beguiled to drop their eggs; these are scyelled and put under different hens, which are allowed to sit at an unseasonable time, and often made to continue in the nest for two or three broods. By this treatment the poor birds are often exhausted, and dies under her compellative duty. When the young ducks are hatched, they are placed near the fire and detered with particular care. By these methods, many ducklings are sent to the mercies of the vultures at Christmas, and have been known to fall fifteen feet; and a ginea per couple. The parish of Aylesbury, including the hamlet of Walton, occupies a large space of ground, and comprehends 697 houses and about 3051 inhabitants, the lower class of whom are usually employed in making of leather.
removed church. In this situation he continued for several years, attending to his duties as a judge of the peace, and one of the ecclesiastical commissioners, and entering very little into those disputes that would have subjected him to the notice of either of the two parties by whom he was suspected. In 1753, he accumulated the degrees of bachelor and doctor in divinity, in the university of Oxford; and in 1756, he succeeded his intimate friend and fellow exile in the see of London; but he incurred ridicule by comparing, and protecting for some years, a plot against him for dilapidations. Indeed, a prudent attention to his own inte- rest was a distinguishing feature in his character. In his church and episcopal capacity, he was singularly in public preaching, occasionally ranting, as it is said, the un- guid attention of his audience by reciting Hebrew verses from a pocket book; and in his efforts for guarding the church against the attacks both of papists and puritans. Perform of both these desiderations, and particularly the latter, were treated by him with a degree of severity, which was not only unwarrantable in itself, but which incurred occasional admonition from the ruling powers. His virulent abuse of some puritan minist'rs exposed him to the no less acrimonious allay of their facetious writers, so that he became the hero of the celebrated Martin Marprelate. See Fuller's Church History, l. ix. p. 223, 224. He was in- volved in a variety of disputes with respect both to the temporalities of his diocese, and his exercise of its spiritual jurisdiction; so that his life was far from being tranquil, though his spirit was bold and resolute, and enabled him to surmount the difficulties with which he had to encounter. Of his resolution and personal courage the two following influences are recorded: one was his submitting to the ex- traction of a tooth, in order to encourage Queen Elizabeth to undergo the same operation; and the other was his cud- gelling his son-in-law for misconduct towards his wife, who was a favourite daughter. Bishop Aylmer died at Fulham, in 1594, at the age of 73 years, and was buried in St. Paul's cathedral. He left seven sons and two or three daughters, to all of whom he left large legacies, which he was enabled to do by his economy and avoide. The char- acter of Aylmer delicately ranks high with respect to tal- lents and learning, but his temper is irreproachable; he was immediately food both of power and money; and he undoubtedly possessed an arbitrary and perfecting spirit. Biog. Brit. Andrew's Hist. of Brit. vol. i. p. 574.

AYLSHAM, or ALBICAN, in Geography, is a respectable market town in Norfolk, in England, situated in a flat and fertile country on the banks of the river Bure. In 1773, an act of parliament was obtained for making this river navigable hence to Coltishall in its course to Yarmouth, a distance of about nine miles, in which space there are five locks: the undertaking was completed in 1779. This town is the capital of the manor of the duchy of Lan- caster, in consequence of which the dechy court is always held here. The manor was granted by Edward III. to the famous John of Gaunt, duke of Lancaster, who built a handsome church in the town, and dedicated it to St. Mi- chael. A free-school was founded here in 1577 by Ro- bert Junius, who was then mayor of Norwich. Aylsham is about eleven miles from Norwich, and 120 from London. It has two annual fairs, and a weekly market on Tuesday: this was formerly held on Saturdays, but has been altered to the former day. Hilory and Antiquities of Norfolk, 10 vols. 8vo.

AYMARES, a jurisdiction of South America, in the diocese of Culceo, about 40 leagues south-west from Culceo. This territory abounds in sugar, cattle, and grain, and is also in mines of gold and silver, which formerly produced large quantities of these valuable metals; but at present few of them are wrought, the country being too thinly inhabited. AYMARGUES. See Aimargues.

AYMOUTH. See Eymouth.

AYNAC, a town of France, in the department of the Lot, and chief place of a canton in the district of Figeac, twelve miles N. W. of Figeac.

AYQUANTOTOTUL, or Avis Ayquantaototul, in Ornithology, the name under which the Oryctes Xanthornus of Gmelin is described by some old writers. Vide Her. M. x. 56a, &c.

AYSCHEM, in Geography, a small place of Spain, in the province of Valencia, upon the river Xacar, at the foot of a mountain, one league from the frontiers of New Castile; the inhabitants of which are said to speak Castilian in its purity.

AYOTECOS, high mountains of America, in Mexico, in the province of Talceda, towards the coast of the South Sea.

AVRSHIRE, a county in the south-western part of Scotland, bounded on the north by the county of Renfrew, on the east by the firths of Lornark and Dumfries, on the south by Galloway, and on the west by the firth of Clyde.

AYSHIRE, in History, a province in Scotland, on the coast of Clyde, and the greater part of Cambusneak, pre- sent a fine, level, cultivated country, intersected with numerous towns and villages. Its rivers are the Tweed, the Ayr, the Esk, the Annan, the Urr, the Conon, the Doon, and the Lugar. This county includes two royal burghs, the Ayr and Irvine, and several towns, among which are Beith, Ballantrae, Girvan, Kilmarnock, Kilwhilling, Largs, and Saltcoats. Ayshire polishes many valuable teams of coal, also former quarries of freestone, limelime, ironstone, and several rich beds of lead and copper ore. A few curious specimens of agates, porphyries, and calcareous petrifications are often found in the hills of Carrick; and a species of whetstone, known by the name of Ayr-stone, is obtained from this county. The population of it, as returned to the house of commons in 1802, was 8,3506, of which 39,666 were males, and 44,640 females.

AYR, the principal town in the above county, is a royal borough of considerable antiquity, and the seat of a judicary inferior court. It was nominated a royal borough by William the Lion, in 1180, and the privileges by charter then granted are still enjoyed by the town. It is pleasantly seated on a point of land which projects into the sea, between the inlets of the rivers Doon and Ayr, and the principal street is broad and ornamented with a row of good houses on each side. Ayr has been a town of considerable trade, but the rising opulence of Glasgow has attracted the merchants from this place. The inconvenient entrance to the harbour proved detrimental to the commerce of the town, but the inhabi- tants are carrying on extensive works to remove all obstruc- tions at the mouth of the river, and render it more commodious for trading vessels; and two new reflecting light-houses are now erecting near the entrance to the harbour. The salmon fishery of the two rivers furnishes employ for many of the inhabitants, and the sand banks of the coast abound with all kinds of white fish. Its population is 5492, and it has 735 houses.

AYR, New Town of, is the name of another town, seated on the north side of the river Ayr. It has baronial jurisdic- tion, and a distinct magistracy from the other town. This place seems to have arisen under the influence of Robert Bruce, who retired
A Z A

retired here upon being attacked with a leprosy, established a lazaretto, and conferred considerable favours on the town, and the neighbouring village of Priedwich. Its population is 1724.

AYR, a river of Scotland, rises in the parish of Muirkirk, in the above county, and after a course of about eighteen miles due west, falls into the frith of Clyde, at the town just described. Its banks are steep and romantic in some places, but in others it often overflows its shores, and does considerable damage.—Alto, a river of France, which runs into the Aisne near Grandpré.

AYRANCES, a town of France, in the department of the Somme, and chief place of a canton in the district of Amiens, nine miles S. E. of Abbeville.

AYRSTOWN, or AYRSTOWN, a town of America, in Burlington county, New Jersey, situated on the middle branch of Ancoos creek, sixteen miles from the mouth of the creek in the Delaware, and thirteen south-east from Burlington.

AVRY See AERY.

AVSCUE, AVSCOUTH, or ASKSW, Sir George, in Biography, an eminent English admiral of the seventeenth century, was descended from a good family in Lincolnshire; and entering into the sea-service in his youth, acquired the reputation of an able and experienced officer, and obtained the honour of knighthood from King Charles I. Adhering, however, to the parliament in the civil war, he was constituted admiral of the Irish seas, where he is said to have rendered great service to the protestant interest, and to have contributed much to the reduction of the whole island. In 1651, he reduced the islands of Sicilly, and also Barbadoes and Virginia, to the obedience of the parliament; and he afterwards behaved with great honour in the war with the Dutch. In 1666, whilst he was engaged with the Dutch fleet, his ship was driven upon the Galloperfad; and being surrounded with enemies, and desiring help from friends, he was obliged to surrender. After this disaster, he went no more to sea; but spent the remainder of his days in retirement, Bingen, Brit.

AVSYLAMENTA, or AVZIAMENTA. See EASEMENT.

AVSYLINGEN, in Geography, a market town of Germany, in a prefecture of the same name, in the diocese of Augsburg, situate on the Danube.

AVY, a river of Austria, in the Blach quarter, on which is seated the market town of Waldhausen.

AVTON, or AITON, a small town of Greece, in Lolland, five leagues north of the Dardanelles of Lepanto. This is thought to be the ancient town of Etholia, called Calypson Aquilea.

AVYUD, AVID, or HAWD, a province of Hindoostan, containing the most northern countries belonging to the Moguls, such as Kakea, Bankhia, Nagarokat, Siba, and others. It is situated to the north-west of the Ganges, and watered by rivers which fall into it; so that, notwithstanding its mountains, it is exceedingly fertile; and its trade with the countries to the north-east renders it very rich. In this province there are many independent rajahs, and two remarkable pagodas, one at Nagarokat, dedicated to the idol Maha, and the other at Kalamak, which is venerated, because the Indians regard it as miraculous, that the water of the town should be very cold, and yet spring from a rock which continually throws out flames.

AZA, in Ancient Geography, a town of Asia, in Syria, famed on an eminence to the west of one of the branches of the river Chalus, south-west of Chaonia.—Allo, an ancient town of the Lesser Armenia, placed by the Antonine Itinerary in the route from Caesarea to Sangala, 20 miles from the latter place.—Allo, a name given in the time of Steph.

Byz. to the town of Gaza.—Allo, a town of Palestine, in the tribe of Ephraim.

AZAB, USSAB, or SABA, in Geography, a territory on the Abydinnian coast of the Arabian gulf, near the islets of Babemundeb, which has been, from time immemorial, the mart of frankincense, myrrh, and balsam. Behind Saba, upon the Indian ocean, is the "Regio Cinnamonorum," where a considerable quantity of that wild cinnamon grows, which the Italian druggists call "canella." Azab, or Saba, was formerly a principal station of the caravans, which traded to Arabia. It lies in N. lat. 13° 5'. E. long. 43° 5', and though it is not a port, it affords a very tolerable road, where is very safe riding, under the shelter of a low desert island, called "Crab Island," with a few rocks at the end of it. The people, however, says Mr. Bruce, are Ga'lain, the most treacherous and villainous wretches upon the earth. They are "Shepherds," who sometimes reform to the coasts in great numbers, and sometimes traverse the hinder part of the hills that run close along the shore, and occupy miserable villages composed of huts, that run nearly in an easterly and west direction from Azab to Raheta, the largest of all their villages. At Azab may be had plenty of water, sheep, and goats, and also some myrrh and medicate at the proper honzon. But no confidence is to be had in the people. Those of Mocha, who are absolutely necessary to them in their commercial transactions, cannot trust them without surety or hostages. Near Azab there are large ruins, which seem to indicate its former magnitude and importance. There is especially an aqueduct, which, in remote times, furnished a very considerable supply of water from a fountain in the mountains, which must have greatly contributed to the beauty, health, and pleasure of the place. This is constructed with large masses of marble, brought from the neighbouring mountains, placed upon one another without lime or cement, but joined with thick cramps, or bars of brass. There is likewise a number of wells, not six feet wide, composed of pieces of marble hewn to parts of a circle, and joined with similar bars of brass. This circumstance is somewhat surprizing, as we are informed by Agatharcides (p. 60), that the Alileans and Cisflandrins, in the southern parts of Arabia, built opposite to Azab, had among them gold in such plenty, that they would give double the weight of gold for iron, triple its weight for brass, and ten times its weight for silver; and that in digging the earth, pieces of gold were found as big as olive-stones, and some much larger. However this be, the inhabitants of the continent, and of the peninsula of Arabia opposite to it, agree, that this was the royal seat of the queen of Saba, famous in ecclesiastical history for her journey to Jerusalem; that these works belonged to her, and were erected at the place of her residence; and that all the gold, silver, and precious came from her kingdom of Sofala, which was Ophi, and which reached from thence to Azab, upon the borders of the Red Sea, along the coast of the Indian ocean. See AYUM.

The ruins at Azab, as well as those at Axum (See AYUM), appear to be those of public buildings, and not of private dwellings; and from this circumstance it has been inferred, that these were not cities of constant residence, but rather places of resort, where the adventurous traders and their attendants lived, as afloat, in their tents, but where their religious rites were celebrated with the greatest solemnity, and in a manner becoming the dispositions of men, who ventured in expeditious across the deserts, for more difficult and dangerous travel across the Atlantic; whence, we may aly imagine, was derived the great influence, or rather power, of the order of peoples, who perhaps were the only constant inhabitants of these spots, which they
A Z A

A Z A

wished to be considered as the favourite shades of their divinities. It appears, however, from the best authorities, that Merfë, Assam, and Azaab, were places that had a common origin, and were most probably, as we have already observed, the principal stations of the caravans that traded to Arabia, while Thébes and Amonmenon continued the communication toward Carthage. Whether from Azaab there was an intercourse with the Ethiopians of the more southern parts of Africa, toward Cape Carthage, and the present Zanzibar, is a question that deserves particular investigation. On this subject, see professor Herran's "Ideen über die Politik, etc." or "Ideas on the Policy, Intercourse, and Commerce, of the principal Nations of Antiquity." Gottingen, 1793.

Azaab, in the "Military Order of the Turks," signifies a particular body of the hussaries taken in, or added first to the janizaries, but now become a separate body from them. The word, in the Oriental languages, signifies an unmar- ried person, and the original order of these was, that they should be single men.

The azabs in Egypt have been great rivals to the jani-
zaries, and sometimes they have got the better. Their in-
fituation and offices are the same with those of the jani-
zaries; but with this difference, that from odo-baizes they are made fersbajees, and from that office caifes, and come into the divan. On the contrary, among the janizaries, when any one is made a fersbajee, it is laying him aside, and he is no farther advanced. Pococke's Egypt.

AZABEU-KABER, from kabir, Kopelch, and azab, tor-
ment, denotes a temporary punishment, which, as the Ma-
hometans say, the wicked must suffer after death. Their crimes are hereby expiated, and Mahomet opens the gate of paradise to all who believe in him. AZADARICHTA, in Botany. See MELIA.

AZADKAR, in Geography, a large town of Periia, called also 'Teins, and placed by Tavorein in an extensive plain, watered by 400 subterranean canals. AZAGARIUM, in Ancient Geography, a town of the European Sarmatia, in the vicinity of the Borylheenus. Ptolomy.

AZAGRA, in Geography, a town of Spain, in Navarre, on the Ebro; two leagues from Calahorra. AZAIZY, a poor and inconsiderable tribe of Arabs, inhabiting a village of Egypt, called Bir Ambar, between the Nile and the Red Sea, about N. lat. 26°, and E. long. 35°; who fubmit by letting out their cattle for hire to the caravans that go to Coiffer. The village probably derived its name Bir Ambar, or the well of Ipaces, from its having been formerly a station of the caravans from the Red Sea, loaded with this kind of merchandise from India. The habitations of the Azazies are constricted of potters' clay, in one piece, in shape of a bee-hive; the largest not above ten feet high, and the greatest diameter fix. Bruce's Trav. vol. i. p. 170.

sions bent in. Stum. filaments five, filiform, inserted into the receptacle, free; anthers simple. Pf. fijl. germ roundish; stylo filiform, the length of the corolla, permanent; stigma obfofe. Per. capulfle roundish, five-celled, five-valved. Sepals five, roundish. Ofb. In some species the corolla is funnel-shaped. Eib. Gen. Char. Cor. bell-shaped; flamina inserted into the receptacle; capulfle five-celled.

Species. 1. A. pontica, Pontic azalea. "Leaves thinning, hemicrushed, smooth on both sides, racemes terminal." This species much resembles rhododendron ponticum; but its flowers are yellow, its leaves smaller, ovate and ciliate. A native of Pontus. 2. A. indica, Indian Azalea, Thurb. Jap. 84. "Flowers sub-fibulat. calyxes hinged below three feet high, with a rough crimson-brown bark. Branches short, twiltled, irregular. Leaves thus, villaace, clove, ever-green. Flowers cover the whole upper part of the shrub, and are of a beautiful bright red colour. A native of the East Indies. It is much cultivated in Japan for the elegance of its flowers, and variety in their size and colours. 3. A. nudiflora, naked-flowered azalea. The varie-
dle length." A. bicolor, red and white azalea. "Lower of the corolla pale; tube red; calyx small; branchets hairy." A. papilionacea, variegated azalea. "Corolla red, the lowest segment white; calyces leafy." A. papilata, downy azalea. "Corolla pale red, divided to the base into five parts." Sp. Char. "Leaves ovate, corollas hairy, fla-
mens very long." In its native country this shrub exceeds fourteen feet in height, but in England, we never see it half this height. Several stems arise from the root. Leaves oblong, smooth, alternate, flanked. Peduncles ax-
illary, long, naked, supporting a cluster of red flowers, which are tubulous, and swelling at the base, like those of the hyacinth, and contracted at the neck; they are divided at the top into five unequal segments, which spread open. The filaments and styles are much longer than the petals, and fand erect. A native of North America; and intro-
duced here by Peter Collinson, esquire, in 1734. 4. A. ephedro, vivid azalea. "Leaves leafy at the edge; co-
rollas with glaucous hairs." Its varieties are, A. oalata, common white azalea. "Branches diffusel; leaves deep green, finning." A. vitatta, white-striped flowered azalea. "Corolla white, with pale red keels; styles elongated; red at the end; leaves pale, ovate, oblong." A. fijla, narrow-
petalled white azalea. "Corolla divided to the very base; leaves deep green, finning." A. floribunda, cluther-flowered white azalea. "Styles longer than the corolla; leaves glau-
cous underneath." A. glaucas, glaucous azalea. "Corolla white; leaves glaucous on both sides, the younger with scattered hairs on the upper surface." This shrub rides with several stems near four feet high. Leaves spear-shaped, nar-
ow at the base, six-facet at the edges with short rough teeth, and flan clusers at the ends of the shoots. Flowers in clusters at the extremities of the branches, white, with a mixture of dirty yellow on the outside; tube an inch long; the two upper segments at the top reflex; the two fide ones bent inwards; and the lower one turned downwards. These flowers have the appearance of those of honey-duckle, and are as agreeably scented; they appear in July. This is nearly allied to the foregoing; but does not flower till after the leaves are expanded. It is a native of North America, and was introduced here by P. Collinson, esquire. 5. A. lapponica, Lapland azalea. "Leaves with excavated dots sprinkled over them." A shrub six or seven inches high. It is to be distinguished from rhododendron dauricum only by its having five flaminas, whereas that has ten. 6. A. procumbens, trailing azalea. Flor. Lapp. ed. 2. 60. t. 6. Eng. Bot. vol. 13. Hud. 88. With. 239. Lightf. 139. Flor. Pan. 1. 9. "Branches procumbent; diffuse; leaves opposite, revolute, very smooth." Stem woody, much branched; branches leafy, round, smooth; leaves opposite, flanked, spread much, ciliate, obtuse, revolute, entire, smooth; po-

3 F 2

ticks
tides channelled; ciliate; peduncles in pairs, commonly one-flowered, reddish, with bractes at the base; flowers erect, of a deep rose colour, bell-shaped, regular; capsule sub-orbicular, acute, five-celled, margins of the valves indented. It grows upon most of the high mountains of Scotland. 7. A. paniculata, dotted azalea. Lour. Cochinch. 113. "Leaves ragged about the edge; flowers dotted, heaped." Five feet high, erect, branched; leaves lanceolate, entire, smooth, alternate; corolla white; calyx whitish, dotted with red, as are also the corollas, anthers, and germ. A native of the woods of Cochinchina.

Propagation and Culture. 1, 2. The Pontic and Indian species have not yet been cultivated in Europe. 3, 4, 5, 6, 7. grow naturally in shady, and in moist ground; many of the plants have been sent of late years from North America to England, and produced beautiful flowers in this country. They must have a moist soil and shady situation; and can only be propagated by seeds from their roots, or by lifting down their branches, for they do not produce seeds here. When any of them are laid down, it should be only the young shoots of the same year, for the old branches will not put out roots. The best time for this is at Michaelmas, and if they are covered with some old tar, to keep out the frost, it will be of use to them. The autumn is the best time to remove the plants, but the ground about the roots should be covered in winter; a practice necessary for the old plants to preserve them in vigour, and cause them to flower well. 5, 6, are low plants, of little beauty, and will only thrive on boggy ground upon mountains. See Martyn's Miller's Dict.

AZAMA, in Ancient Geography, a town of Africa, placed by Ptolemy fifteen days journey distant from Carthage bay; fourth south of Cirta. It is supposed to be the present Zemara.

AZAMBUJA, in Geography, a small town of Portugal, containing from seven to eight hundred houses, situated in a well-cultivated plain on the banks of the Tagus, not far from Lisbon.

AZAMOGLINS. See AZEMOGLINS.

AZAMOR, in Geography, a small sea-port town of Africa, in the kingdom of Morocco, and province of Daghelia. It is situated on the river Morbaya, at some distance from its mouth. This town is not adapted to maritime commerce, because the entrance of the river is dangerous. It was unsuccessfully besieged by the Portuguese in 1528; but taken in 1533 by the duke of Braganza, and abandoned about the end of the sixteenth century. At a little distance from Azamor, facing a spacious bay, are the ruins of the ancient city of Titus, supposed by Chénon (Preident State, &c. of Morocco, vol. i. p. 37.) to have been one of the cities founded by order of the senate of Carthage. Near the same place are the ruins of Almedina, a town built by the Moors. The cape of Azamor stretches out to the west. See Mazagan. N. lat. 33° 20'. W. long. 8° 20'.

AZAMORA, in Ancient Geography, a strong place of the former Armenia, in Catania, Strabo.

AZANAGHIS, in Geography, a people on the coast of Africa, near cape Blanco. They inhabit the adjacent desert, and not far from the Arab of Hodeis. Their food is dates, barley, and the milk of their camels. They acknowledge no master, but the more wealthy among them are treated with some tokens of respect. Their goods are cached rather in that of being prodigals and improvident, they are poor, and without gold, and live in huts dispersed in several places along the coast.

AZAN, in Ancient Geography, a people of Asia, in Phrygia, to whom they were annexed. Strabo.

AZAN, one of the three grand divisions of Arelvania, according to Strabo. Steph. Byz. says, that it contained seventeen towns.—Also, a port of the maritime coast of Ethiopia. Pliny.

AZANITIS, a country of Asia Minor, in Phrygia, in which was the source of the river Rhynacus. Strabo.

AZAYOTON, or AZASOL, a land of desert, in Africa, Libya, almost destitute of water, and which is traversed by the canals, like the sea.

AZAPES. See ASAPES.

AZAR, in Ancient Geography, a mountain in Egypt. Ptolemy.

AZAR, in Geography, a town of Arabia, seventy-six miles south-east of Amman inidia.

AZARA, in Ancient Geography, a town of Asia, in Armenia Major, placed on the river Araxes. Strabo. — Also, an ancient town of Asia Minor. Ptolemy. — Also, a temple of Ammon, in Abythia, Strabo.

AZARABA, a town of Asia, in Sarmatia. Ptolemy.

AZARECAH, or AZARAKITES, in History, the denomination of a sect of heretical Mussulmans, so called from Nafs Eba al Azarah their founder, who acknowledged no power or government, temporal or spiritual. They consisted of a combination or assemblage of all who rejected and opposed the Mahometan faith; they were sworn enemies of the house of Omeyyad; and committed dreadful ravages in all the Moslem territories through which they passed. In the sixty-eighth year of the Hegira, they made an irruption into Iraq, and carried their barbarous exactions to such a height, that they murdered all persons whom they met with, rigged open women with child, and committed every species of cruelty that could be invented on people of every description, without discrimination. During this period their founder died, and was succeeded by Katt Eba al Fojat, under whose conduct they continued their depredations. Mufab, the governor of Mutful and Misopotamia, sent a body of troops against them, commanded by Omar Eba Abdallah Temini, who completely routed them at Nisibur, in Chorasan, slew many of them, and pursued the rest as far as Isfahan and the province of Kerman. See Mahometans.

AZAREDO, in Geography, a sea-port town of South America, in the bay of Spirito Santo, on the coast of Brazil. This is a famous port for sugar. S. lat. 20° 18'. W. long. 40° 12'.

AZARIAH, or Uzziah, in Biography, one of the kings of Judah, succeeded his father Amaziah in the year 809 before Christ. The early part of his reign, in which he was pious and virtuous, was prosperous and happy; he obtained great advantages over the Philistines, Ammonites, and Arabs. He was devoted to agriculture, though he had a flaxen army of 507,500 men, with large magazines, well furnished with arms both offensive and defensive; he employed many husbandmen in the plains, vine-dressers in the mountains, and shepherds in the valleys. Towards the close of his life, and of his reign, which lasted fifty-two years, he became an idolater, died of a leprosy, and was buried, not in the royal sepulchre, but in an adjacent field. 2 Kings, xx. 2 Chron. xxvi. There are many high-priests and others, mentioned in scripture, and in the Jewish history, who bore the name of Azariah.

AZARIAS, a learned Italian rabbi, lived in the sixteenth century, and published at Mantua, in 1574, a Hebrew treatise, entitled, "Mor en Ajin," or "The Light of the eyes," in which are collected, with considerable learning and knowledge of the Chriftian scriptures, several points of chronology and criticism. The work contains a Hebrew translation of the book of Artaxerxes on the LXX. Nov. Dict. Histor.

AZAROLUS, or AZAROLE, in Botany. See COXAGUS.

AZARUM,
AZARUM, a small, dry, blackish, stringy, medicinal root, much used in France as a specific for the farcy in horses. The azarum, called also nardus fylafaclus, grows in the Levant, Canada, and about Lyons in France. The frilt is reputed the bell. It is given in powder, from the quantity of an ounce to two.

AZATIA, in Ancient Geography, a town of Asia, in Medea, or Armenia.

AZATHA, a town of Asia, in Armenia Major. Ptol.

AZAY LE FERON, in Geography, a town of France, in the department of the Loire, and chief place of a canton in the district of Chatillon, for 19 miles S.S.E. of Chatillon.

AZAY l' Albéau, a town of France, in the department of the Loire and Loire, and chief place of a canton in the district of Chauconin, four leagues south-west of Tours, and four north-east of Chablis. The place contains 1708 and the canton 11,244 inhabitants; the territory includes 275 kilometres and 12 communes.

AZAZEL, in Jewish Antiquity. See SCAP-COAT.

AZED, in the Materia Medica, a name given by the Arabian writers to a kind of campfhor, which they make the third, then placing it after the acarari and arbigr. The first of the ftre was the finest of all the kinds of camphor, and was collected tolerably pure from the tree, as it grew in Cufcar, the place whence it was named. The abriagi was the fame campfhor, rendered yet more pure by sublimation; this was a discovery of one of the kings of that country, and the campfhor was named from him. The third kind, or azed, was the fame with what we now receive from the Indies, under the name of crude or rough campfhor. The word azed signifies only large, and was used to express the campfhor formed into fuch large cakes, as it is also at this time. Arinna fays, this campfhor was grofs, of a dufty colour, and much less bright and pellucid than the other kinds. See CAMPFHOOR.

AZEDARACH, in Botany. See MEIAD.

AZEKAH, or AZECHA, in Ancient Geography, a city of Judah, strong both by situation and its walls; in the tribe of Judah, and feated in the fame north-west corner with Lebanon and Meskedon, in the valley of Terebinth, where David slew Goliah. Jof. xv. 35. 1 Sam. xvii. 1. Eufebius and St. Jerome inform us, that, in their time, there was a city of this name between Jerusalem and Eulphemus.

AZELFOGE, in Astronomy, a fixed star of the second magnitude, in the tail of Cygnus.

AZEM, in Geography. See ASAM, and ASEEM.

AZARAILLES, a town of France, in the department of the Meure, and chief place of a canton in the district of Launville, three leagues south-east of Launville.

AZETENE, sometimes called Ancicnt, in Ancient Geography, a country of Asia, in Armenia Major, between the sources of the Tigris and Eufrates, to the South of Sapharna. Ptolomy.

AZEVEDO, Ignatius, in Biography, a Portuguese Jesuit, was born at Oporto, in 1547, and reining an ample fortune of which he was heir to a younger brother, he devoted himself to religion in the society of the Jesuits at Coimbra. In paccs of time he became a millonary, and was depicted as such to the Indies and Brazil, under the title of procurator-general for those countries. Having given an account of his firft voyage to the general at Rome, he set out on a second miffion with a great number of attendants; but whilst the ship was falling, in 1570, towards the island of Palma, it was taken by corsairs, and all the millionaries were put to death. On this account, Azevedo and his third company have been honoured as martyrs in the church of Rome; and the history of their mission and martyrdom was published by Deauvais, a Jesuit, in 1744. Morev.

AZEYTAO, in Geography, a small town of Portugal, in Elxremadura, containing of 552 houses, and 2342 inhabitants. It has a manufacture of cottons, and carries on a considerable trade in wine and oil, for which its situation, between the two harbours of Lisbon and St. Ulbab, is convenient.

AZILICOLLAR, and AZILA, a town of Spain; the country of Sevilla, eighteen miles north-west of Sevilla.

AZIZINHA, in Ancient Geography, an island of the Mediterranean. Ptg.

AZILAR, in Geography, a town of Asiatic Turkey, in the road between Confla (inimple and Toeet.

AZILLES, a town of France, in the department of the Aude, and chief place of a canton in the district of Carcassome; thirteeen miles N.E. of Carcassome. N. lat. 45° 23'. E. long. 2° 33'.

AZIMGUR, a town of Hindollan, in the country of Alhadel; 108 miles W.N.W. of Patna, and 50 N. of Beares.

AZIMUS, or AZIMUMTUM, in Ancient Geography, a small city of Thrace, on the Illyrian borders. This city, scarcely mentioned by geographers, has been distinguished in the annals of history by the martial spirit of its youth, the drill and reputation of the leader whom they had chosen, and their daring exploits against the innumerable hordes of the northern barbarians. Instead of tamely expecting their approach, the Azimumtines attacked, in frequent and successful sallies, the troops of the Huns, rescued from their hands the spoil of the captives, and recruited their domestic force by the voluntary association of fugitives and defectors. After the treaty of peace between Attila and the eastern empire, A.D. 446, the Barbarian conqueror still menaced the empire with implacable war, unless the Azimumtines were persuaded, or compelled, to comply with the humiliating conditions which their sovereign had accepted. Theodorus, dilating authority over a society of men who had bravely affered their natural independence, the king of the Huns condescended to negotiate an exchange with the citizens of Azimus. They demanded the restitution of some shepherds, who, with their cattle, had been accidentally surprized. After diligent, but fruitless inquiry, the Huns were obliged to swear, that they did not detain any prisoner belonging to the city, before they could recover two surviving countrymen, whom the Azimumtines had detained as pledges for the safety of their host companions. Attila was satisfied, and deceived by their fecken affectionation, that the rest of the captives had been put to the sword; and that it was their conTent practice immediately to difmiss the Romans and the defectors, who had obtained the security of the public faith. If the race of the Azimumtines, whether this diffimulation on their part be excused or condemned by political caufes, had been encouraged and multiplied, the Barbarians would have ceased to trample on the majority of the empire. At a subsequent period, in the war of the emperor Maurice against the Avars, A.D. 595—602, the Azimumtines manifested a considerable degree of the invincible spirit of their ancestors. See Gibbon's Hist. vol. vi. p. 63, &c. vol. vii. p. 201, &c.

AZIMUMUTH, in Astronomy. The azimuth of the sun, or of a star, is an arc of the horizon, comprehended between the meridian of the place, and any vertical circle passing through the sun or star; and it is equal to the angle at the zenith formed by the said meridian and vertical circle, which is measured by the fore-mentioned arc.

The word is pure Arabic, which signifies the same thing. The azimuth is reckoned easterly in the morning, and westward in the afternoon; and it is usually estimated from the north, or from the north, as it is nearer to the one or to the other of those points. Thus if it be found by observation, that the vertical circle which passes through the zenith and a star intersects the horizon just in the midway between the
the east and the south, then the star's azimuth is said to be 45° eastward of the south. It is the complement of the eastern or western amplitude to a quadrant.

The azimuth is found trigonometrically, by this proportion; as radius is to the tangent of the latitude, so is the tangent of the fun's altitude to the cosine of the azimuth from the south at the time of the equinox. Otherwise, suppose the latitude of the place, and the fun's declination to be given, and let it be required to find the fun's altitude and azimuth at 6 o'clock. E. G. Let London be the place in N. lat. 51° 34', and let his declination be 25° 28', as it is on the longest day; then to find his altitude and azimuth at 6 o'clock in the morning and evening, construct a figure in the following manner. Describes the meridian (Plate II. Astroonomy, fig. 20.), draw the horizon HR, and prime vertical ZN; make RP = latitude 51° 32', N; draw the 6 o'clock semicircle PS, the equator EQ, the 23° 28' N. parallel of declination n, intersecting the 6 o'clock semicircle PS in O; and through Z, O, N, describe the azimuth circle Z ON, intersecting the horizon in A; then the triangles Z OP and \( \varphi \delta A \) are supplemental triangles to one another. In the spherical triangle Z OP, rightangled at P, we have

\[
\text{Given the colat. } ZP = 38° 28' \\
\text{The co-altitude } \delta \circ \text{ the azimuth } \varphi \circ ZP.
\]

Or, in the spherical triangle \( \varphi \circ A \), right-angled at \( \lambda \),

\[
\text{Given the lat. } A \gamma \circ = 51° 32' \\
\text{the declin. } \varphi \circ = 23° 28' \\
\text{Required the altitude } A \circ \\
\text{the co-altitude } \varphi \circ A
\]

To find the altitude \( A \circ \).

\[
\begin{align*}
\text{As Radius} & = 10,000,000 \\
\text{To fin. declin.} \delta &= 23° 28' \\
\text{So fin. lat.} &= 51° 32' \\
\text{To fin. alt.} &= 18° 10' \\
& = 9,493,877
\end{align*}
\]

To find the azimuth \( A \circ \).

\[
\begin{align*}
\text{As Radius} & = 10,000,000 \\
\text{To Colat.} &= \gamma = 51° 32' \\
\text{So tang. declin.} &= 23° 28' \\
\text{To co. tang. azimuth} &= 74° 53' \\
& = 9,431,444
\end{align*}
\]

For the arc \( AR \) measures the \( \angle RZA \), the azimuth.

On the shortest day at London the parallel of solstice declination cuts the 6 o'clock hour-circle below the horizon; and as the triangles \( \gamma \circ A \circ \) and \( \varphi \circ A \circ \) are congruous, the depression below the horizon, on the shortest day at 6 o'clock, will be equal to the altitude at the same hour on the longest day; and the azimuth will also be equal, if estimated from the south. Thus, on the 21st of June, the fun will bear N. 74° 53' E. at 6 o'clock in the morning, and N. 74° 53' W. at 6 in the evening; but on the 21st of December, at the same hour, it will bear S. 74° 53' W., and S. 74° 53' W. From this problem, it appears, that as the declination increases, the altitude increases and the azimuth decreases, and the contrary happens while the declination is decreasing; so that on the days of the equinoxes, when the fun has no declination, the altitude at 6 o'clock will be nothing, or the fun will be in the horizon; and the azimuth being then 90°, the fun will be due east in the morning, and west in the evening; that is, on the days of the equinoxes, the fun rises and sets at six, in the east and west points of the horizon.

Again. Given the latitude of a place, the fun's declination and altitude; required the hour from noon, and the fun's azimuth. E. G. In the latitude of 51° 32' N., the fun's altitude was observed to be 46° 20', when his declination was 23° 28' N.; what was the fun's azimuth, and the hour when the observation was made?

Let the primitive circle ZRN (fig. 21.) represent the meridian of London, HR the horizon, and ZN the prime vertical; make RP = 51° 32' the height of the pole at London; draw the axis PS, and the equator EQ; lay off the declination E, QR, 23° 28' N. the altitude HR, RZ, 46° 20'; and describe the parallel of declination n, and the parallel of altitude n, intersecting one another in O; the place of the fun at that time; through Z, O, N, describe an azimuth circle Z ON, and through P, O, S, describe an hour circle P CS; then the angles O ZP, O PZ, being measured, will give the azimuth and hour from noon required; or, they may be computed in the following manner.

In the oblique-angled spherical triangle P Z O,

\[
\text{Given the colat. } ZP = 38° 28' \\
\text{the co-alt. or zenith distance } Z \circ = 43° 49' \\
\text{the co-decl. or polar distance } \circ P = 66° 32'.
\]

Required the azimuth, Z \( \angle \) ZP,

and the hour from noon Z \( \angle \) PZ.

To find the azimuth, or angle Z \( \angle \) PZ.

Here Z \( \circ \) = 43° 49'

ZP = 38° 28'

\[
\begin{align*}
\text{O } Z & \text{- } Z P = 5° 12' = D. \\
\circ P & = 66° 32'.
\end{align*}
\]

Then co-arith. fin. co-lat. = 38° 28' - 0.25917

cos-lat. fin. co-lat. = 43° 49' - 0.16286

fin. \( \frac{1}{2} \) fun. co-decl. and D = 35° 52' - 9.79782

fin. \( \frac{1}{2} \) diff. co-decl. and D = 30° 49' - 9.79761

The sum of the four logs -

-19.84246

The \( \frac{1}{2} \) fun gives 36° 31\( \frac{1}{2} \)°

And 59° 31\( \frac{1}{2} \)° doubled gives 115° 3° for the azimuth sought, reckoning from the north.

To find the hour from noon, or Z \( \angle \) PZ.

Here P \( \circ \) = 66° 32'
PZ = 38° 28'

\[
\begin{align*}
P Z & \text{- } P Z = 28° 4' = D . \\
O C & = 43° 49'
\end{align*}
\]

Then co-arith. fin. co-decl. = 66° 32' - 0.03749

cos-lat. fin. co-lat. = 38° 28' - 0.20617

fin. \( \frac{1}{2} \) fun. co-alt. and D = 35° 52' - 1.76782

fin. \( \frac{1}{2} \) diff. co-alt. and D = 7° 48' - 9.31203

The sum of the four logs -

-19.14411

The \( \frac{1}{2} \) fun gives 21° 55'

And 21° 55° doubled gives 43° 50° for the measure of the hour from noon, which is 21° 55° 20'.

Hence it appears that the observation was made either at 9° 4°.
AZO

9° 4' 40" in the morning, or at 2° 55' 20" in the afternoon.

The azimuth being first found, the hour from noon might have been found by the proportion between opposite sides and angles. If the declination and latitude had been of contrary names, the same kind of process would have served for finding the things required, except that the compass would have been obtused by adding the declination to 90°, instead of subtracting it, as in the case of the latitude and declination having like names.

To find the azimuth by the Globe, see Globe.

AZIMUTH, Magnetic, is an arc of the horizon contained between the azimuth circle of the celestial object, and the magnetic meridian; or it is the apparent distance of the object from the north or south point of the compass. This is found by observing the object with an azimuth compass, when it is about ten or fifteen degrees high, either in the forenoon or afternoon. See Compass.

AZIMUTH COMPASS, is an instrument used at sea for finding the sun's magnetic azimuth.

The description and use of the azimuth compass, see under Azimuth Compass.

AZIMUTH Dial, or a dial whose whole face or gnomon is at right angles to the plane of the horizon.

AZIMUTHS, called also Vertical Circles, are great circles of the sphere intersecting each other in the zenith and nadir, and cutting the horizon at right angles. The horizon being divided into 360°, there are utally reckoned 360 azimuths. The azimuths are represented by the rhumbs on common sea-charts; and on the globe these circles are represented by the quadrant of altitude, when foewed in the zenith.

On these azimuths is reckoned the height of the stars, and of the sun, when he is not in the meridian; that is, the azimuths show what distance there are from the horizon.

AZINCOURT, in Geography. See Azincourt.

AZIO, a town of European Turkey, in the province of Livadia, sixty-four miles north-east of Lepanto.

AZIRIS, in Ancient Geography, an ancient town of Armenia Minor. Prot—Als, a place of Africa, in Libya, where, as Herodotus says, the Cyrenseans established themselves.

AZIRUSTUM, an agreeable place in Armenia Minor, over against Thera, surrounded by hills, and watered by a river. Herodotus.

AZIZUS, in Mythology, derived from the Syrian azas, force, an epithet given to Mars, adored at Edea. Bryant says (Anal. Anc. Myth, vol. i. p. 27.), that Az or As was one of the titles of the sun, and that Azizus, formed by a reduplication of the same term, denoted the deity of Edea and Syria, and was the same as Asis and Isis, made feminine in Egypt, who was supposed to be the father of Osiris, the fun.

AZMAVETH, AZNOH, or Beth Shemesh, in Ancient Geography, a city probably in the tribe of Judah, adjacent to Jerusalem and Anathoth. Nehem. vii. 28. xii. 29.

AZMERE, in Geography. See Agimere.

AZMON, in Ancient Geography. See Assenom.

AZNALCHA, in Geography. See Agimere.

AZNOTH-TABOR, or Aznoth, in Ancient Geography, is placed by Eusebius in the plain, not far from Damascus. Jos. xix. 34.

AZOCHIS, a town of Palestine, in Galilee. It was situated near Sephonia, and taken by Ptolemy—Als, an ancient town of Aisa, in Mepotamia. Pliny.

AZOF, in Geography, a town and fortress on the Don, containing about 3800 inhabitants; distant from St Petersburg 1998, and from Moscow 1268 veres. It is well known that the Don is the Tanais of antiquity. Now, in this region, many ages ago, flowed a town of the same name with the river, which had been built by the Greeks. Chardin pretends that Azof is situate fifteen Italian miles inland from the river; whereas the old town of Tanais is only three Italian miles distant from the river. What reasons there were for giving this statement, concerning one or the other, it is difficult to determine. Though we cannot absolutely prove that the town Tanais stood precisely on the site of the present Azof, yet it is manifest that it was in this district. The more ancient a town is, the more likely it is to have undergone considerable and frequent alterations; and the less reason there is for imagining that it stands exactly on the old primitive spot, of which Rome alone may afford an example. Concerning Tanais, however, Claudius Ptolemaeus affirms it to have been situate near the present Azof. For admitting, as he does, the Don to be the boundary between Europe and Asia, he gives the town Tanais to the Asiatic division. Strabo (p. 215. 342. ed. Caland.), placing the town on the same side, at the same time infers that it was built by the Bosphoran Greeks. Greeks, in its earlier periods, was extremely populous; and some parts of it, from the nature of their soil, were not productive enough for the nourishment and support of their prolific inhabitants. Hence they were necessitated to construct numerous towns on the sea-coast and on several islands, in order to devise means for remedying so great a defect. The commerce, to which the sea gave them all necessary accommodations, furnished this people at the same time with other means of freeing themselves from poverty. For, at one time, particular towns, at another whole tribes, united to found colonies to different places out of Greece. These new settlers gradually formed colonies on the shores of Pontus, Sicily, the inferior parts of Italy, in France, and several other countries; so that the commerce of almost the whole world then known was imperceptibly drawn into their hands. In like manner they planted their colonies round the whole coast of the Euxine, where, on the coasts of the peninsulas of the Crimea, Theodoria, Cherion, Pantikapaum, and other towns, became particularly famous. At what time the town Tana, or the present Azof, fell into the possession of the Genoese, is not now to be ascertained. It may however be surmised, that they obtained it from the Polovtzes before the incursion of the Tartars, and therefore prior to the year 1297, as they would not have been able to cope with the Tartarian forces. The Genoese were still in possession of the Crimea, and at the same time of Tanais or Azof, in 1424, though the Turks had conquered Constantinople in the year 1453. In 1637, Azof was captured from the Turks by Candor; and in 1642, after being reduced to ashes, it was reconquered by the Turks. On the twenty-eighth of July 1656, it surrendered to the arms of Peter the Great; who in 1711, in consequence of the unfortunate affair at the Pruth, restored it to the Turks at the treaty of Bender; from the Turks it was again captured by the Russians in 1739; but by the treaty of Belgrade they were obliged to raise it to the foundations. It remained in an abandoned state during thirty years. But in the last war against the Turks, Catharine II. caused it to be re-erected, and it is now in the best state of defence. Coins of Azof have been found, bearing on them the name of Khan Taktamyan. Azof is situate in the government of Ekatkarinolass; which belonging partly to Little Russia and partly to the Zaporogian Koakats, till the year 1751, when it began to be occupied by colonists from all nations, was one continued waste rape, entirely void of inhabitants, but has since proved a great acquisition to the industry and trade of the country, under the name of New Servia. The ecclesiastical affairs of the
the Russians are under the archbishop of Ekatarinoslav and Cherfonetourida; and in his absence under his vicar the bishop of Feodosia and Marmopol. The other religious communions are governed by their own spiritual prefects.

AZOR, Sea of, called by the ancient Phals Mucitis, formerly by the Russians the Putrid sea, and in some maps Zabachea sea, is a gulf in the Euxine, to which it is joined by a strait. It is situated in the dominions of Russia, between 52° to 57° east Ferro; lat. 45° 26′ to 47° 20′ N. It is of 210 miles in length, and from 40 to 60 in breadth. It has six harbours: Taganarok, Marmopol, and the little port of Petropil close to the town, Azof, Maftakof, and fort St. Dimitri near the mouth of the Don. Of all these, Taganarok has the greatest trade in exports; being next to that of Chariton in the Euxine. Azof at present is not far by of so much consequence as it formerly was, Russia having now so many harbours on the Turkish waters, and as that arm of the Don, on which Azof lies, is gradually filling with sand from year to year. The other harbours are for the most part of little significance as to foreign commerce. From Taganarok, in 1793, were exported bariron, tallow and tallow-candles, butter, wheat, and various kinds of grain, hemp, building and carding, wax and wax-candles, silk, linens, cloth, goats hair, borax, and various kinds of drugs, opium, medicinal drugs, pearls, precious stones, gold and silver, &c. The whole northern coast of the sea of Azof, from the Don to Potokop, is laid out in fisheries, to which occupation these districts are extremely favourable. They fish with nets that have in the middle a conical bag, in which the fish assemble; and one single draught, which generally lasts only six hours, yields 60,000 fish; among which, however, are found but few vigorous, shads, and other large kinds of fish. The salted and smoked mackerel, called by the Turks akkun are an important article of trade in the Crimea, and are frequently sent from Feodosia and Balaklava to Constantinople, and to all the maritime towns of Natolia and Romedia. These fish are transported in barrels, and a thousand of them are loaded on the spot for three and a half or four pinnaces. Tuycke's View of the Russin Empire, ii. 75.

AZORIA Ships, in Commerce, are those Spanish ships commonly called the quicksilver ships, from their carrying quicksilver to the Spanish West Indies, in order to extract the silver out of the mines in Peru and Mexico. But it is a great mistake to imagine that these ships are absolutely laden with quicksilver only; for though fraudulently speaking, they are to carry no goods unless on the king of Spain's account, they are usually full laden, notwithstanding this regulation, by reason that the merchants procure special licences of the king to load, upon paying a consideration for such licences.

AZONI, derived from the privative a and zon, zone, or country, in Miykel 25, a term anciently applied to such of the gods as were not the peculiar divinities of any particular country or people, but were acknowledged as gods in every country, and worshipped by every nation. See GOD.

These azoni were of a degree above the visible and sensible gods, which were called zoni; who inhabited some particular part of the world, and never filled out of the district or zone that was allotted them. Such in Egypt were Osiris, Isis, and Bacchus; and in Greece, the Sun, Mars, the Moon, and Pluto. They were called by the Romans dii communis.

AZOOGHAGUS, from s, zeon, animal, and p, to eat, in Natural History, a term used by authors to express such insects or animals as feed on herbs, never eating the flowers or seeds which are more living, and the fury of the waves, which are frequently very injurious, by overthrowing whole fields
fields of grain and folds of cattle, breaking down their fences, and overwhelming their hovels. Nevertheless they produce wheat, wine, fruits, and abundance of wood; and they have many quadrupeds both wild and tame. One of the lateest accounts we have of These Islands is that of Mr. Adamson, who visited them in 1753, on his return from Senegal; but it is to be regretted, that the interesting islands, like all the other Portuguese settlements, are almost unknown.

AZORIUM, or Azores, in Ancient Geography, a town of Greece, in Pelagonia Tripolitidis, according to Strabo and Livy. It was situated among the Phereasarians, at the confluence of two rivers which formed the river Curatius.

AZOP, in Agriculture, a substance which is only distinguishable in its different fires of combination with other matters. Its effects on vegetation, when in the state of gas, are probably not yet fully ascertained. According to the observations of Humboldt and Scopoli, some sorts of plants when exposed to form droop and die, while others, as ashes, continue to increase and grow in a perfect manner.

AZOT, in Chemistry, is one of the most important of the substances hitherto considered as elementary, existing very abundantly in nature, forming the greater part of the atmosphere, the peculiar and almost characteristical ingredient of animal matter, the basis of the nitric acid, and one of the constituents of the volatile alkalis.

Pure or uncombined azot is only known in the form of a gas; it is then synonymous with the phlogisitified air of Scheele and Priestley, the atmospheric phlogisit, of Lavoisier, and the nitrogen gas of Chartal and some other French chemists.

It was by experiments on the various substances which alter, corrupt, and deteriorate common air, that the properties of azotic gas became first familiar to chemists. In all these, and in the direct eudiometric experiments, or such as decompose the air in order to ascertain its purity, it is the oxygen, together with the carbonic acid, and other usual ingredients, which is subtracted by the chemical re-agents; whilst the azotic gas alone remains unaltered and unabsoorbed. Hence, chemists had at first no other knowledge of azot than as a residue untouched in chemical operations, and its properties could only be described by negatives, till the important discoveries of the composition of nitric acid, of ammonia, and of animal matter, gave a new interest to azot as a chemical element.

Azotic gas may be obtained in various methods. In every eudiometric process, as we have just mentioned, the residue is azotic gas of greater or less purity. Thus, if phosphorus be burned in a confined quantity of common air, after the combustion has ceased, the residue is azotic gas in considerable purity, generally however holding some of the phosphorus in solution.

Another method of obtaining this gas, first employed by Scheele, is to moisten a quantity of iron filings and sulphur, mix them in a glass vessel full of common air inverted over water, and in a few days by the absorption of all the oxygen of the air, the azotic gas will be left pure.

Another, and a very speedy method of procuring this gas in great purity, is by agitating common air in contact with a solution of sulphate of iron saturated with nitrous gas.

These methods, with the precautions to be observed, will be further noticed under the article Eudiometry, in which it will be seen that the proportion of azot to 28 in the atmosphere, is, with little variation, about 73 per cent.

Azotic gas may also be readily procured in large quantities by the decomposition of animal matter by means of nitric acid.

If very dilute nitric acid be poured on any animal matter, particularly muscular flesh or the coagulum of blood, and a gentle heat is used, azotic gas is given out in great purity. This experiment is one of a series of excellent observations on Animal Matter made by Bethollet, which we have already noticed under that article. The azot in this instance proceeds from the animal matter, and not from the acid.

In the decomposition of Ammoniaca by the oxymuriatic acid, and in the reduction of some metallic oxides by this alkali, azotic gas is also given out in great purity.

In a single instance, azotic gas may be laid to be mineral, for a very considerable number of this air rises up in bubbles through the springs of several of the native hot springs, such as Thole of Bath and Buxton. The nature of the air thus obtained was first observed by Dr. Priestley.

Azotic gas is absolutely incapable of supporting combustion. When a lighted taper is dipped in a jar of this air, it becomes instantly extinguished without any noise or explosion. It is equally deleterious to animal life (whence its derivation, from α, and δέείρον, depriving of life) and the fatal effects to an animal immered in it come on so speedily, that it has been thought by some to pollute a positively noxious power independent of the mere absence of oxygen.

Azotic gas is somewhat lighter than common air. Its specific gravity when obtained from common air by iron filings and sulphur, is stated by Kirwan to be 0.9912, or in the proportion of 985:1000 compared with atmospheric air. Lavoisier makes it only 0.99115, or to common air, as 941.6:1000.

With oxygen, azot forms a variety of combinations. That of atmospheric air has already been mentioned. A simple admixture of oxygen with a small proportion of azotic gas produces no particular effect, but when the combination is absorbed by the electric spark, a true combustion of azot takes place, and the product is the Nitric Acid. This beautiful discovery we owe to Mr. Cavendish.

When azot and hydrogen are mixed together, both in the gaseous form, no union appears to take place; but under different circumstances Ammonia is produced.

Azotic gas, when heated with Charcoal, with Sulphur, or with Phosphorus, dissolves a small portion of these simple substances, and holds them in suspension for a considerable time.

Very little is known concerning the action of azot in its simple form upon metallic or saline substances; and in the state of gas, it appears to be more inactive and unwilling to enter into combination than any other substance in nature.

Azot has not hitherto been decomposed, so that it must be considered as a chemical element. Several attempts, however, have been made for this purpose, but none of them have proved satisfactory. The last of these, which excited much attention in Germany, was that of Weigh-b, a justly eminent chemist, an account of which he published in Crell's Annals for 1756. The chief experiment on which this philosopher grounds his theory of the composition of azot is the following: if an earthen tube of small diameter (the stem of a tobacco-pipe for instance), be heated quite red-hot, and the stem of water be run through the tube in this state without any visible connection with the external air, a considerable quantity of a gas is generated, which consists almost entirely of azotic gas, mixed with a small quantity of carbonic acid. Hence, this chemist would infer, that as nothing but water and heat are present, the azotic gas here produced is formed by the union of the vapour of water with caloric at a very high temperature. A second experiment is to pass the vapour of water over the oxyd of manganese,
manganese, enclosed in an earthen tube, and already heated for a considerable time, so as to expel all the oxygen which it will yield: in this case also, there will be a very considerable production of azotic gas. A third experiment is to pass the vapour of water through heated glass tubes, of no more than two lines in diameter, when azotic gas will be equally produced. The inference of the composition of azotic gas derived from these experiments, would be very legitimate, if no cause of error could be detected; but the society of Dutch chemists, who have enriched the science with so many valuable observations, on repeating the experiments, fully explained the reason of this singular phenomenon, in demonstrating the permeability of every kind of earthen-ware got glazed, when exposed to a considerable heat. Therefore in these experiments, the vapour of water in passing through the tube, is found partly to make its way through its pores into the surrounding coals; and at the same time the air circulating through the furnace, partly enters the tube, and is collected at the further extremity; and this air being vivatied by the burning fuel, is principally azotic gas, mixed with a certain portion of carbonic acid. This permeability of heated earthen-ware (which had been before observed by Dr. Prichley), should always be kept in mind by chemists; as many of the most important experiments of research are performed by the ingestious apparatus of a heated tube. With regard to the production of azotic gas, when the vapour of water was sent through a red-hot glass tube, it was fully ascertained by the above-mentioned chemists, that no gas of whatever kind appears whilst the tube remains perfect, but that the leaf crack or fissure is sufficient to give admittance to the air of the furnace with as much ease as the pores of the earthen tube. As an additional proof that the gas in these infinances came from without, we may add, that on removing the fire from the earthen tube, and continuing the transmission of the aqueous vapour, some gas still continued to be given out, whilst it remained red-hot; and this latter portion was atmospheric air, or that which now surrounded the heated tube.

Several other circumstances relating to azotic gas, are connected with the theory of Philistia, to which we shall further refer the reader. Ann. de Chem. tom. 26 and 29.

AZOT, Gaseous Oxid of See Nitrous Oxid.

AZOTH, among the Ancient Chemists, signified the first matter of metals; or the mercury of the metal, more particularly that which they call the mercury of the philosophers, which they pretend to draw from all sorts of metallic bodies.

Paracelsus's azoth, which he boasted of as an universal remedy, is pretended to have been a preparation of gold, silver, and mercury; a quantity of this he is said to have always carried with him in the pomme of his sword.

AZOTUS, AZOTH, or Ashdod, in Ancient Geography, one of the five Philistine fatrapies, was a celebrated sea-port of Phoenicia, on the Mediterranean, situate about fourteen or fifteen miles south of Ekron or Accaron, between that and Ascalon, and about thirty miles distant from Gaza, towards Joppa. It fell at first to the lot of Judah, but continued for a considerable time in the hands of its ancient owners. It was in this city that the ark of God triumphed over the idol Dagon, which fell down and was crushed before it (1 Sam. v. 2.); and it was to this place that Philip was conveyed, after he had baptized the Ethiopian eunuch. Acts, viii. 40. This place was fortified by the Egyptians as a barrier against the Assyrians; and it was fo strong, if we may believe Herodotus, that it sustained a blockade and siege of twenty-nine years, under Ptolemy, king of Egypt, about 631 years before the Christian era. It was again re-established, but taken, and its fortresses and towers burned, by the Maccabees, in the year 137 B.C. Afterwards Gabinius, the Roman president of Syria, ordered it to be rebuilt. It was again captured by Vespasian, on the Jewish war, under the reign of Nero, A.D. 67. The ruins of that once famous city are now called "Azield"; it is distinguished, from Volney (Travels in Egypt and Syria, vol. ii. p. 133.), at present by its horrions, but exhibits no proofs of its ancient importance. Three leagues from Azond, is the village of El-Majdel, where they flay the finest cottons in Palestine, which, however, are very coarse. This traveller reports, that the whole coast is daily accumulating rude, and confound with few parts as all an oracle of law. When his friend Bartholomew Carrara, archbishop of Toledo, was summoned to Rome by the inquisition on a charge of heresy, Azulcuet, though eighty years of age, went thither to plead for him; and at this advanced age he retained his faculties in their full vigour. Such was his charity to the poor, that he seldom paid a beggar without giving him alms; and it is said, that the mule on which he usually rode would drop of its own accord when he saw a beggar. He died at Rome, in 1566, at the great age of ninety-two years. A collection of his works was printed at Lyons, in 6 volumes fol. in 1597; and at Venice, in 1602. Nouv. Dict. Histo.

AZAILL, in the Mahometan Theology, the angel of death, whose office it is, according to the Mahometans (who relate many ridiculous stories concerning this angel), to separate the souls of men from their bodies.

AZATL, in Ornithology, a name by which a kind of white heron is known in Mexico.

AZUA DE COMPOSTELA, or AZUCA, in Geography, a sea-port town on the sea-coast of St. Domingo; twelve leagues S.S.E. of Cape Salinas.

AZUAGA, a town of Spain, in the province of Extremadura; three leagues south-east of Llerana.

AZUIS, in Ancient Geography, an ancient town of Africa Propria. Ptolemy.

AZUMAR, in Geography, a town of Portugal, in the province of Alentejo.

AZUN, a valley in that part of the department of the Upper Pyrenees, formerly called Bigore, in France, distinguished by the number of its valuable mines of silver, copper, iron, lead, and tin. Those that are already known amount to no fewer than twenty; but lead chiefly abounds throughout the whole of this mountainous country.

AZURE, the blue colour of the sky. See Blue, Cloud, and Sky.

AZURE, in Heraldry, signifies blue; in heraldic engravings it is expressed by horizontal lines.

AZURE. See Ultramarine.

AZURE, or SMALL. See Cobalt.

AZUREA, in Entomology, a species of Phryganus, with black wings, violet behind. Linnaeus. The lower wings are obliquely violet. It inhabits the north of Europe.

AZUREA, in Zoology, a species of Lacerta that inhabits Africa, and is distinguished by having the tail verticillated, short, with mucronated scales. Linnaeus. Guerin speaks of two
two varieties of this creature; one, a native of Africa, is rather larger than the preceding, and is described under the name of cordulus brachyus: Laur. Amp.: the other has a deep chestnut coloured stripe on the shoulders.

The colour of this species in its natural state, Dr. Shaw imagines to be an elegant pale blue, fuscated on the body and tail with several transverse and somewhat alternate bands either of black, or very deep blue. This kind figured in the Gen. Zool. of Dr. Shaw, and illustrated the species, appears to be the second variety mentioned by Gmelin, having a dark band on the shoulders. Dr. Shaw observes that the head is rather obtuse; the body moderately thick, and covered as well as the limbs with very small smooth scales; and the tail on the contrary, which is of a moderate length, is very distinctly and strongly verticillated by rows of large ciliated scales, the extremities of which project considerably so as to form so many shining points.

AZURENSIS, or, Aurensis, in Ancient Geography, an episcopal see of Africa, in Numidia.

AZUREUS, in Entomology, a species of Carabus, of an azure colour, with red legs and antennae. Inhabit Leipiec. Fabricius.

AZURUS, a species of Cistus, of a middle size; dull green colour; and yellowish mouth and legs. This kind inhabits Guinea. Of. The abdomen is yellowish, with black dots in the middle.

AZURIN, in Ornithology, a name assigned by Buffon Hist. Off. to the species of Turdus, since called specifically cyanurus by Gmelin, which see.

AZUROUX, a name given by Buffon to the emberiza carulola of Gmelin. See Emberiza Carula.

AZYGOS, in Anatomy, a vein arising out of the cava, otherwise called vena flave pari, because single, whence its name. See Veins, Descript. of the.

AZYMITES, in Ecclesiastical History, Chaldaia, which communicate in bread not leavened or fermented. See Azymus. This appellation is given by Cerularius to those of the Latin church, upon his excommunicating them in the eleventh century. Du-Cange. The Armenians and Ma-ronites also use azymus, or unleavened bread, in their office; on which account some Greeks call them azymites.

AZYMUS, composed of the privative α and ζυμη, fer-ment, something not fermented, or that is made without leaven.

The term azymus is much used in the disputes betwixt those of the Greek and Roman church; the latter of whom contend that the bread in the mass ought to be azymus, unleavened, in imitation of the paschal bread of the Jews, and of our Saviour, who instituted the sacrament on the day of the passover; and the former strenuously maintaining the contrary, from tradition and the constant usage of the church. This dispute was not the occasion of the rupture between the Greek and Latin churches; Photius having broken with the popes 200 years before; though it is urged that before the time of Photius, A.D. 866, azymus was used in the Roman church; and that it was more generally used through the West, for which the authority of Alcuin, who died in 794, is alleged. St. Thomas, in 4 Sent. dift. 2, q. 11, art. 2, quod linctum, 3, relates, that during the first ages of the church, none but unleavened bread was used in the eucharist, till such time as the Ebionites arose, who held that all the observances prescribed by Moses were still in force; upon which both the eastern and western churches took to the use of leavened bread; and, after the extinction of that heresy, the western church returned to the azymus; the eastern perniciously adhering to the former usages.

This account is contested by father Sirmond, in a dissertation on the subject; wherein he shews, that the Latins had constantly communicated in leavened bread, till the tenth century, and cardinal Bonn, Rerum Liturg. c. 23, p. 185, greatly distinguishes what St. Thomas alleges.—In the council of Florence it was decreed, that the point lay at the discretion of the church; and that either leavened or unleavened bread might be used; the western church has preferred the latter.

AZZALUM, in the Ancient Physiology, a species of iron, reputed the most excellent of all, supposed to have been brought from India, whence it was called Indianum, but in reality, according to some, brought from China. Plin. Hift. Nat. lib. xxxiv. c. 14.

AZZO, Portius, in Biography, an eminent Italian lawyer, who held the professorship of jurisprudence at Bologna, from the year 1192, till his death, which probably happened not long after 1226, and at this time the university was attended by 10,000 students. Such was his affluence as a lecturer, that he paid he never was ill but in the vacations. He was the author of a “Summary of the Code and the Institutes,” which has passed through several editions. Of this work, Gravina says, (De Orig. Jur. v. i p. 93.) that it is so ingenious and profound, that although written in a barbarous age, we cannot, with all our present erudition, be safely without it. One of his scholars collected the “Introduction to the Code” of this author, which has been printed; and several of his writings remain in manuscript. Sour. Dict. Hist. 

AZZOGLOIO, in Geography, a town of Italy, in the principality of Mafferao; six miles N. N. E. of Maffe- rano.
B

The second letter of our alphabet, and of most others.

This observation fails in the ancient Irish alphabet; where B is the first, and A the seventeenth; and in the Abyssinian, where A is the thirteenth.

B is the first consonant, and first mute, and in its pronunciation is supposed to resemble the bleating of a sheep; upon which account Pierius tells us, in his Hieroglyphics, that the Egyptians represented the sound of this letter by the figure of that animal.

B is also one of those letters which the eastern grammarians call labial, because the principal organs employed in its pronunciation are the lips. It has a near affinity with the other labials P and V, and is often used for P, both by the Armenians, and other orientals; as in Betrus for Petrus, affinis for absens, &c.; and by the Romans for V, as in amavit for amatus, Berna for bernia, &c.; whence arose that jell of Aurelian, on the emperor Bonosius, Non ut vivat natus est, sed ut bilat. See V.

The final B was also sometimes changed into L in the ancient languages, as Bethzabul for Bethzaphub. Bochart (Hieroz. p. ii. iv. c. 9. p. 501.) and Grotius (in Matth. x. 25.), have given instances of such changes.

B and C, or the K of the Greeks, are often substituted for one another. Thus, the Greeks say, βαδαγος for Kopexagov; and the Latins Basso for Caflno. B and D are also used interchangeably, as in Bellum and Duellum. See Quesnel, de Ort. c. 45.

Plutarch observes that the Macedonians changed φ into B, and pronounced Bilph, Berenice, &c. for Philip, Pherecides, &c.; and that those of Delphos used B, instead of H; as βατοσ for ετιομ νευατοσ for ετιομ νευατοσ. See P.

The ΕὐΔΟΣ change the Ι into γ, as βαθαγος for βαθαγος.

The modern Greeks call the beta, vita.

The Latins said suprano, oppresso, for subprano, etpreno, and pronounced optimus, though they wrote olimus, as Quiniellian has observed. They also used B for F or Ph; thus in an ancient inscription mentioned by Gruter, oinfraeido is used for offaeido. See F, &c.

B requires an entire closure and preasure of the lips, and is pronounced by forcing them open with a strong breath. This letter also, if it pass through the mouth, becomes an M; as appears by those who have the nozils plugged by a cold or otherwise, when they endeavour to pronounce the letter M; for infl. cc, many men, is by such a one sounded many ben. See M.

With the ancient B, as a numeral, flood for 300, as appears by this verse:

"Et B trecentum per se retinere videtur."
pellation to their respective idols; and thus were introduced a variety of deities under the denomination of Baal, called Baalim, or Baal, with some epithet annexed to it, as Baal-Berith, Baal-Gad, Baal-Molah, Baal-Peor, Baal-Zebub, &c. Some have supposed that the descendants of Ham first worshipped the sun under the title of Baal (1 Es 2 Kings. xxii. 11.), and that they afterwards added to it the patriarch who was the head of their line; making the sun only an emblem of his influence and power. It is certain, however, that when the custom prevailed of deifying and worshipping those who were in any respect distinguished amongst mankind, the appellation of Baal was not restricted to the sun, but extended to those eminent persons who were deified, and who became objects of worship in different nations. The Phenicians had several deities of this kind, who were not intended to represent the sun. It is probable that Baal, Belus, or Bel, the great god of the Carthaginians, and also of the Sidonians, Babylonians, and Assyrians, who from the testimony of scripture appears to have been delighted with human sacrifices, was the Moloch of the Ammonites, the Chronus of the Greeks, who was the chief object of adoration in Italy, Crete, Cyprus, and Rhodes, and all other countries where divine honours were paid him, and the Saturn of the Latins. In process of time, many other deities, besides the principal ones just mentioned, were distinguished by the title of Baal amongst the Phenicians, particularly those of Tyre, and of course among the Carthaginians, and other nations. Such were Jupiter, Mars, Bacchus, and Apollo or the sun.

The term Baal, as we have already observed, denoted God or Lord among the orientals; and the Zeus of the Greeks had the same meaning. Servius (in Æn. i.), who is followed by Vossius (Theol. Gent. l. i. c. 4.), observes, that Baal in the Punic language had two significations, either denoting Saturn, or being equivalent to the Latin dux or god. Accordingly, if Baal and Zeus, or Jupiter, be words of the same import in different languages, we may apply to the former what Varro, cited by Tertullian, says of the latter, that the number of these deities who passed under this denomination amounted to 369. Some, however, are of opinion, that there were originally only two gods of the Phenicians, and consequently of the Carthaginians; and that all the other deities were comprehended under two; viz. Baal and Ashtaroth, or Belus and Altar. See Sold. de Dios Syr. Syn. 2. c. 2. p. 125. Shuckford's Connexion, b. v.

The temples and altars of Baal were generally placed on eminences; they were places inclosed with walls, wherein was maintained a perpetual fire; and some of them had statues or images, called in scripture "Chammath." Maundrell, in his journey from Aleppo to Jerusalem, observed some remains of these idolatrous altars in Syria. Baal had his prophets and his priests in great numbers; accordingly we read of 450 of them that were fed at the table of Jezoel only; and they condescended to worship the deity, by offering sacrifices, by dancing round his altar with violont gestures, and exclamation; by cutting their bodies with knives, and lancets, and by running in processions to the temple, as if they were possessed by some irresistible power. Several of these practices, and particularly that of cutting the body, were, according to Mode (vol. ii. p. 774.), cemetery sites, as appears from Lev. xxii. 5. xiii. 28. Deut. xiv. 1. Jerem. xxvii. 37. xxvi. 6; and they were retained, says this learned author, in the funeral worship of those that were deified after their death. Hence, and from other circumstances, he infers, that Baal was a demon-god. See BAALIM, DEMON, and IDOLATRY.

BAALBEK, in Geography. See Balbec.

BAAL-BERITH, in Ancient Mythology, derived from bedel, savorign, and berith, covenant; a deity acknowledged under this title by the Carthaginians and Phenicians in their alliances.

Jupiter was worshipped by these people under the denomination of Belus or Baal; to him they addressed their oaths, and they placed them at the head of their treaties. Hence force have not scrupled to affirm, that he was the Baal-Berith of the Phenicians (see Baal, in Mythol. vol. i.), but Cumberland (see Sanchoniah's Phon. Hist. p. 153.) supposes that Baal-Berith was Cronus, or Ham, worshipped anecdotally at Berytus. See Judg. xiii. 13. 14.

According to Bryant (Anal. Anc. Mythol. vol. ii. p. 359.), the Baal-Berith of the Canaanites was no other than the Akite god; with whose idolatry the Hrodites in general were infected, soon after they were settled in the land of Canaan. (See DERRY.) The Greeks, however, had their Laripers, or Jupiter, the avengers and arbitrator of oaths; and the Latins their Deus Fidus, or Jupiter Plinhus, whom they regarded as the god of honesty and integrity, and who presided at treaties and alliances.

BAAL-GAD, BAGAD, or BEGAD, an idol of the Syrians, whose name was composed of baal, lord, and god, chance or fortune; the god of chance or fortune. After the god of thunder, the god of chance was one of the first worshipped by mankind. See Philo. Trans. vol. iv. N. 2. an. 1706.

BAAL-GAD, in Ancient Geography, a city of Palestine, at the foot of mount Hermon, so called from the deity Baal-Gad, who was worshipped in this place. Jer. xii. 4.

BAAL-HAMMON. See Bacot.

BAAL-Hazor, a city of Ephraim, where Abishal kept his flocks. 2 Sam. xii. 23.

BAAL-HERMON, a town of Palestine, generally placed north of the tribe of Issachar. 1 Chron. xii. 23.

The temple of Baal-Heron in mount Libanus (Judges, iii. 1, 3.), was probably founded, says Bryant (Anal. Anc. Mythol. vol. ii. p. 163.), by the Cdminians, who formed one of the Hivite nations in those parts.

BAALIM, in Antiquity Mythology, inferior deities among the Phenicians.

The learned Joseph Mele (vol. ii. p. 774.) having suggested that Baal, or in the Chaldee dialect Bel, was the first king of Babyl after Nimrod, and that the first that was deified and reputed a god after his death, apprehends that this gave occasion for denominating all other deities Baalim. Thede Baalim, he conceives, were the deified souls of the dead. Bryant also (vol. ii. p. 529.) is of opinion that the most early devotion to idolatry confided in the worship of the sun, and that of deities, called Baalim. See DEMON.

BAAL-MEON, in Ancient Geography, a city of Canaan, in the tribe of Reuben, taken by the Moabites, and pofticed by them in the time of Ezekiel. Num. xxxix. 38. 1 Chron. v. 8. Ezek. xxv. 9. Ezechias and Jerom place it nine miles from Eibus or Elephon, at the foot of mount B orn or Aharon.

BAAL-Peor, or BAAL-PHAGOR, in Mythology, an idol deity of the Moabitids and Midianites, supported by force to have been Pharaus, whose worship was conducted with great impurity; by others to have been Adonis; and by others to have been Saturn, adored under this appellation in Arabia. The learned Mele, supposing Peor to be the name of a mountain in Moab, upon which a temple of Baal was erected, concludes that Baal-Peor was only another name of Baal, derived from the situation of his temple; and to add no more, Selden (De Dies Syris, Syntag. 1. c. 5.) observes that Baal-Peor is Pluto, founding his conjecture on Pt. civ. 28. where it is said, "They joined themselves unto Baal-Peor, and ate the offerings of the dead." The sacrifices to which these words refer, says this author, were offered.
offered to appease the manes of the dead. But these sacrifices or offerings of the dead may mean no more than the sacrifices or offerings made to idols, or false gods, whose properly called "the dead," in contradistinction to the true God, called in scripture "the living God." BAAL-PERAZIM, in Ancient Geography, a place of Palestine, in the valley of Rephaim, not far from Jerusalem, where David put to flight the Philistines. 2 Sam. x. 20.

BAAL-SAMMAI, or BAAL-SHEMMAI, according to the Hebrew mode of expression, q. d. the Lord of honour, in Mythology, a deity of the Phenicians, which was, probably, the fun, to whom they and the Carthaginians paid divine honours, added to him with their arms extended, Belahm, or the queen of heaven, was the moon.

BAAL-TAMAR, in Ancient Geography, a place of Judaea, in the tribe of Benjamin, situate, according to Eusebius, near Gibeah, where the children of Israel engaged the tribe of Benjamin. Judg. xx. 33.

BAAL, in Mythology, a goddes among the Phenicians, chiefly worshipped at Byblos; supplicated by fome to have been the same with Diana of the Greeks.

BAAL-ZEBUB, See Beelzebub.

BAAL-ZEPHON, or BAAL-TZEEPHON, q. d. the god or idol of the north, in Mythology, a deity of the ancient Egyptians, so called, according to Dr. Shaw, (Trav. p. 309.) in contradistinction, perhaps, to others of the lower Thibasis, whose places of worship were to the south or east. But if Tzefon be derived from 7ESE, to fly, act, or adverbe, then Baal-tzephon will probably signify the "god of the watch-tower," or "the guardian god," such as the Hermes or Terminus of the Romans, the EZEH-GOD of the Greeks, &c. At the temple of this deity, according to the Jerusalem Targum, Pharaoh, when he was pursuing the Israelites in their exodus, offered sacrifice, waiting till the next day for an attack upon Israel, whom he believed his god had delivered into his hands; but, in the mean time, they passed the Red sea, and escaped.

BAAL-ZEPHON, in Ancient Geography, a place thought by some to be a city, opposite to Pihahiroth, where the Israelites encamped before they passed the Red sea. It was distinguished either by its northern situation, 7ESE, signifying the north, in Exod. xxv. 26. Josh. viii. 11. from his in other places of scripture; or by some watch-tower or idol temple that was extended upon it. Dr. Shaw supposes, that this place was at the eastern extremity of the mountains of Suez, or Atsam, the most conspicuous of these deferts; insomuch as it overlooks a great part of the lower Thibasis, as well as the wilderness that reaches towards, or which rather makes a part of, the land of the Philistines. Accordingly Migdol might lie to the north, and Baal-tzephon to the north of Pihahiroth. For the march of the Israelites from the edge of the wilderness being towards the sea, or the south-east, their encampments betwixt Migdol and the sea, or before Migdol, could not well have another situation. See Exod. xiv. 2. xiv. 2. q. Numb. xxxviii. 7. Eusebius reports, from ancient traditions, that the Israelites passed at Chafera, the Kofoun of the Arabs, both of the terms signifying destruction, which was a very expressive appellation, if it was deduced from the destruction of the Egyptian army. The situation of Kofoun, it has been said, is near Suez; and hence it has been thought, that Baal-tzephon was at Suez, though Poecocke, Shaw, and Bruce, place it farther to the south. In support of this opinion it has been further alleged, that the appellation Baal-tzephon, the god of the north, implies, that the temple of this deity stood on the northern extremity of the Red sea itself, or on the northern extremity of the gullet called Pihahiroth. "Baal-tzephon," says Bruce (Travels, vol. i. p. 233.) "was probably none

idol's temple, which served as a signal-house upon the cape which forms the north entrance of the bay, opposite to Jubb-el Atakah, where there is still a mosque, or saint's tomb. It was probably a light-house, for the direction of ships going to the bottom of the gulf, to prevent missing it for another foul bay, under the high land, where is also a tomb of a saint, called Abou Derage." See PIBAHIROTH.

BAAL'S RIVER, and BAY, in Geography, lie in West Greeneland, between Bear Sound on the south-east, and Delft's Point on the north-west, and opposite to the mouth of Hudson's Strait.

BAAN, John Dr., in Biography, an eminent portrait-painter, was born at Haelem, in 1653, and after receiving instructions in the art of painting from his uncle Piemans, pursued his studies with singular ability under Bakker, at Amsterdam. Having determined to form himself upon the model of Van Dyck, his merit was soon universally known; and he was invited by Charles I. to London, where he painted the portraits of the king, queen, and chief nobility at court, and was much admired for the elegance of his attitudes, and also for his clean, natural, and lively tone of colouring. Upon his return to the Hague, he painted a noble portrait of the duke of Zell, for which he received a sum amounting nearly to 500l. The bell of De Baan's performances is the portrait of prince Maurice of Nassau, in the execution of which he exerted the utmost efforts of his pen. He died in 1702. Pilkington.

BAAN, Jacob Dr., the son of the former, was born at the Hague in 1673; and having acquired eminence as a painter under the instruction and by the example of his father, he came over to England about the age of twenty, among the attendants of William III., and he was favourably received. From England, where he gained by his performances in portrait-painting distinguished reputation, he travelled through Tuscany to Rome, and there devoted himself to the prosecution of his studies. However, though he gained a considerable sum of money by painting several portraits and conversations, during his residence at Rome, he squandered it away by various modes of prodigality and excess. His premature death, at the age of twenty-four, A. D. 1700, and the previous interruption of his abilities, prevented his arriving at that excellence of which his talents were capable. Pilkington.

BAANITES, in Ecclesiastical History, the followers of Baanes, who adopted and disseminated the Manichean notions in the ninth century, about the year 810.

BAAR, in Geography, a lordugrave of Germany, in the circle of Swabia, belonging to Furlenstein, situate to the east of Brieg, The source of the Danube is in this territory.

BAARBAS, BOBARAS, or BACHARAS, in Botany, an extraordinary kind of root, said to grow on mount Lebanon, in a valley called Baraur, whence the name, near the city Macheron.

By the account which Josephus gives of it, it seems to be a root of vegetable phosphorus, for he represents it as of a flame colour, emitting rays of light in the night, and disappearing by day.

BAARIOS, in Geography, a river of Asia, in Kamb chanthe, which runs in a valley between two mountains.

BAAT, in the language of the Samae, anwering to ticeul in that of the Chinefe, denotes a weight and coin current in those kingdoms. It weighs about half an ounce.

BABA, in Biography, a Turcoman impolrot, and pretender to prophesy, who appeared among the Mahometans, in the city of Amaha in Natalia, in the year of the Hegira 638, A. D. 1240, and who seduced a great multitude of followers. One of his disciples, named Isaac, published his commission, and gained a number of adherents. Baba and Isaac concurred in commencing acts of hostility against all
all who would not adopt their profession of faith, viz. "There is but one God, and Baha is his apostle," and all they put several Mahometans and Christians, who refided them, to death. At length, the Mahometans and Curilians uniting together, raised an army, which entirely routed their followers, destroyed many of them, and took their two chief captives, who were afterwards beheaded: and thus their left was totally annihilated. Herbelot. Bib. Orient. Sale's Korâ. Introd. p. 187.

Baba, in Geography, a territory in the jurisdiction of Guayaquil, in South America, extending to the skirts of the Cordilleras, or the mountains of Anga Marcia, belonging to the jurisdiction of Latacunga. Beside the principal town of the same name, at some distance from a river of the same appellation, there are two other places called San Lorenzo and Palenque, from the capital, and near the Cordilleras, whose inhabitants are little civilized. The cacao-trees, which abound in this district, produce fruit twice in the year.

Baba, or Tenisfaro, a town of European Tukey, in Bulgaria, 64 miles east of Siliistra.

Baba, Cape, a cape of Natalia, in Asia Minor, between the islands of Tenedos and Lesbos, and near the gulf of Arademyt, on the coast of the Archipelago. N. lat. 39° 33'. E. long. 26° 22'. It was formerly the promontory Leitoa. A small town of the same name, situated to the east of the cape, on a lofty ground, has a small harbour for boats; it is famous in Turkey for the knife and sword blades which are manufactured there for the use of the orientals. It is peopled by Turks and Greeks; the adjacent soil is tolerably good, and furnishes the same productions as that of Troas. Olivier's Trav. vol. ii. p. 56.

Baba, in Ornithology, the Russian name of the Pelican.

BABACHIKA, in Geography, one of the Bilbafos islands.

BABAHOYO, a territory and town of the jurisdiction of Guayaquil, in South America. The town is the site of the grand cullom-house, where account is taken of the various commodities that are conveyed to or from the Cordilleras and adjacent countries. Beside the principal town, this district contains Ujiba, Caracol, Queila, and Mangaches; the two latt border on the Cordilleras, and are at a considerable distance from Ujiba, where the principal roads diverge during winter, and whence he removes to Babahoyo in the summer. The capital, besides its settled inhabitants, has always a great number of traders from other ports. This country, being level and low, is overflowed by the streamings of the rivers Calama, Ujiba, and Caracol; so that at Babahoyo the water rises to the first story of the houses; and during winter it is entirely defetered. In this district cacao is abundant. It also produces cotton, rice, Guinea pepper, and a great variety of fruits. It has likewise large droves of black cattle, horses, and mules, which, in winter, are kept in the mountains, and in summer are removed to the low lands to feed on the cullomate, a plant so luxuriant as to cover the ground, and rising to the height of two or three yards high.

BABAIN, a town of Perâia, in the province of Kerman, ninety miles south-east of Sergian.

Babain, a village orburgh of Egypt, built on the ruins of an ancient town, about six miles west of Acmounain.

BABA-BABA, one of the richest countries of Abyssinia, about five miles from the river Baha, and near the lake Tana. This on the fourth, and Weeroona on the north, are the two granaries that supply the rest of the kingdom. It contains a number of small villages; in which the queen and many of her relations have their houses and possessions. Thee villages are all surrounded with Kolquall tree, as large in the trunk as those of the province of Tigré, but less beautiful, and furnished with fewer branches. Bruce's Travels, vol. iii. p. 504.

BABBI, Gregorio, in Biography, a tenor singer in the Italian operas, with the sweetest, most flexible, and most powerful voice of his kind, that his country could boast at the time. He flourished from 1720 to 1730; never was in England; but we have seen the principal songs that were composed for him, and concerted with many good judges that heard him sing them, and have no doubt but that he was a dignified, splendid, and powerful performer.

BABBINI, Matteo, in Biography, fo named from being the scholar or imitator of Babbi, arrived in England in 1760, at the same time as Rubini. He had a tenor voice that was sweet, though not powerful, had an elegant and pleasing style of singing; but it was easy to imagine that his voice had been better; and not difficult to discern, though his taste was modern, and many of his rifferamenti refined and judicious, that his graces were sometimes redundant, and his manner affected. His importance was very much diminished, when he sung with the Mara; and after the arrival of Rubinielli, he sunk into insignificance.

BABBLING, among Hunters, is when the hounds are too buily after they have found a good scent.

ABEL, William, in Biography, organist of All-hallows, Bread-street, seems to have been the first, in this country at least, who thinned, simplified, and divested the music of keyed-instruments of the crowded and complicated harmony, with which, from the convenience of the clavier, and passion for full and elaborate music, it had been embrafed from its earliest cultivation. This author acquired great celebrity by wire-drawing the favourite songs of the opera of Rinaldo, and others of the same period, into flowy and brilliant legons, which, by mere rapidity of finger in playing finge founds, without the affittance of taffe, expression, harmony, or modulation, enabled the performer to affonish ignorance, and acquire the reputation of a great player, at a small expence. There is no instrument fo favurable to such frotthy and unmeaning music as the harpsichord. Arpeggios, which lie under the fingers, and running up and down the scales of cley keys with velocity, are not difficult, on an inftument of which neither the tone nor tuning depends on the player; as neither his breath nor bow-hand is requisite to give exellence or fweetnefs to its founds. And Mr. Abel, by avoiding its chief difficulties of full harp-wire, and diftinguifhing motion of the parts, at once gratified thefe dfires and vanity. We remember well, in the early part of our life, being dappled to the glare and glister of this kind of tinfel; this pouffeir dales les yeux, which Mr. Felton continued, and other dealers in notes, et rien que des notes, till Jozzi, the finger, by his neat and elegant manner of executing the brilliant, graceful, and pleafing legons of Alberis, rendered them the objects of imitation. At knithg, on the arrival of the late Mr. Bach, and conftruction of pianoforces in this country, the performers on keyed-instruments were obliged wholly to change their ground; and instead of furipifying by the seeming labour and dexterity of execution, had the real and more useful difficulties of taffe, expression, and light and shade, to encounter. Abel, who was one of his Majesty George the First's private mufic, died about the year 1772.

ABEL, in Ancient Geography, a city and tower built by Noah's posterity in the plain of Shinar, Gen. xii. 9. Its precise situation is not ascertained; nor is it of any great importance to determine it. It was within the province of Shinar, and probably the ancient Babylon was erected on or near its ruins. (See SHINAR, and BABYLON.) Some trave

...
vellers, led by a tradition of the inhabitants, have judged a place about eight or nine miles to the west, or northwest of Bagdad, to be the tower of Babel. This is called the tower of Nimrod, and is conspicuous at a great distance, being insulated in an extensive plain between the Euphrates and Tigris, and referred by its ruins a shapeless mountain more than a tower. Ranwulf supposes he found the ruins of Babylon upon the Euphrates, near Pelhja, about 36 miles to the south-west of Bagdad; and Della Valle directed, by another tradition, to seek it about two days journey lower, near an ancient city called Hella, seated on the same river. After all, there is no end to conjectures; the ruins described by many authors seeming to be rather the remains of some later structures raised by the Arabs, than those of the original tower of Babel. The time of this enterprise is generally allowed to have been before the birth of Phege, about the year 2247 B.C., in the year of the flood 101 according to the Hebrew calculation; in the year 401, according to the Samaritan; and, according to the Septuagint, in 531. The perfoms concerned in this undertaking were, according to the history, the potter of Noah; who journeying from the east, found the plain of Shinar, where they dwelt, and conccurred in this enterprise. There is no reason, therefore, for excluding the family of Shem, as some have done, from any share in this memorable transaction. Bryant, however, maintains that Shem and his potterty had no concern in it; and that the chief agents were the sons of Chus, or Chuthites; and that they were the ancient Pisrs, or worthy traders of Babel. The motives which induced them all to unite and co-operate in the execution of this design have been differently assigned. Accordingly, the meaning of the paffage which announces it, has been differently interpreted. It is as follows: "And they said, go to, let us build us a city and a tower, whose top may reach unto heaven; and let us make us a name, lest we be scattered abroad upon the face of the whole earth." Some have supposed, that they apprehended a second deluge, and in order to secure for themselves a refuge in case of danger, they determined to erect this lofty building. Others, who imagine, that if this had been their purpose, they should have selected an eminence, and not a plain, for the site of their proposed edifice, suppose that they engaged in this undertaking in order to prevent that separation and dispersion of which they had been previously admonished. The scripture, say these perfoms, expressly affirms the intention of the conccrd, which was "to make for themselves a name," or establish a memorial of themselves, "lest they should be scattered," or, as the words are otherwise rendered, "before they should be scattered abroad." Other interpreters allege, that the word יִשָּׂר, ishm, should be translated "a sign," and not "a name;" and they render the paffage "let us make us a sign, lest we be scattered;" and thus as Perizonius (Orig. Babyl. c. 10. p. 168. c. 11. p. 193. c. 12. p. 223.) explains it, the tower, to serve them as a beacon, or mark, by the sight of which, or of a signal from the top of it, they might avoid dividing in the open plains with their flocks (the first men being shepherds), and he brought back again into the city, which they had built for a place of abode, as they were unwilling to be dispersed. As to the expression "of its top reaching unto heaven," it is a Hebrew paraphrase, merely devoting its great height; and for this purpose we read of cities walked up to heaven. Some, however, have supposed, that the phrase was intended to denote the use to which this tower was to be appropriated, or that it was to be consecrated to the heavens, or to the worship of the sun, moon, and stars, of the fire and air, and other natural powers, as deities; and as it indicated a tendency towards idolatry, the true God interposed to prevent a total and irreclaimable defection. Whatever was the design with which this edifice was constructed, Almighty God thought proper to restrain the execution of it (Gen. xi. 6.), by the confusion of language and dispersion which ensued. See Confusion of Languages, and Dispersion of Mankind. From this confusion, the city and tower were denominated Babel. By altering in the word Babel the second beth into a lamed, the paffage (Gen. xi. 9.) might be thus rendered, "the name of it was called Babel, because there the Lord did build; that is, confounded the lip of all the earth:" or thus, "the name of it was called confusio, because there the Lord confounded the lip of all the earth." Some have supposed, deviating indeed too far from the literal history (vid. Bocharti Oper. t. i. p. 36.), that Moses did not mean any particular tower, but that he spoke in general of a turreted city, or a city with turrets on its walls. Such a city, compared with the caverns in which the first men unquestionably lodged, might well appear a tower with a heavenly or very elevated top, like the habitations of the Anakims; these being furnished with natural rocks or peaks, and that with artificial elevations. See Gen. xi. 4. Deut. i. 28. The materials of which this tower was constructed were, as the scripture informs us (Gen. xi. 3.), burnt bricks instead of stone, and slime instead of water. According to an enlerr tradition, three years were employed in making and burning these bricks, and each of them was 12 cubits long, 10 broad, and 5 thick. The slime was of a pitchy substance, or bitumen, brought from a city in the neighbourhood of Babylon, called Is or Hi. Oriental writers, on whose report we can repose little confidence, pretend that the city was 313 fathoms in length, and 151 in breadth; that the walls were 5533 fathoms high, and 33 broad; and that the tower itself was no less than 10,000 fathoms or 12 miles high. St. Jerome affirms, from the testimony of eye-witnesses, who, as he says, examined the remains of the tower, that it was four miles high. But it is needless to recount more of these fables. See Babilon. BABEL-MANDEB, sometimes called BABEL-MANDES, in Geography, a narrow strait at the entrance into the Red sea, which connects it with the Indian ocean, lying between the south-western coast of Yemen or Arabia Felix, and the coast of Adel in Africa, and formed by the projecting head of Arabia on the east, and that of Abyssinia on the west. The width of this strait is about 30 geographical miles; and within it, about a league from the coast of Yemen, is the small barren island of Perim, sometimes called Babel-mandeb, which has a good port, but is without fresh water. This island is called by Arrian the isle of Diomirns. Near the African coast are several small islands, and on the continent is the town of Zeita, which is subject to the Imam of Yemen. Vessels that navigate this strait most commonly pass between the isle of Perim and Arabia, though the paffage is narrow, on account of the number of small islands on the African coast. The currents are strong, and the swell high, so that it is difficult to pass without a fair wind; hence this navigation has been dreaded by the unskillful mariners of the adjoining countries. In ancient times the navigation of the Arabian gulf, which is even now flow and difficult, was considered by nations around it to be so extremely perilous, that it led them to give such names to several of its promontories, bays, and harbours, as convey a striking idea of the impression which the dread of this danger had made upon their imagination. Accordingly, the entry into the gulf, they called Babel-mandeb, which signifies the gate or port of...
of destruction; to a harbour not far distant, they gave the name of Mts., or death; and an adjacent headland they called Gardefan, or the cape of burial. Near this strait Ptolemy places a town, which he calls in the Greek Dandref, probably a corruption of Mande; and the promontory on the south side of the strait, and the city upon it, is Dirae, which means the Hades, or Hell, by Ptolemy called Aes. A cluster of islands met with in the canal, after passing Moqba, is called Jibbel Zekir, or the islands of prayer for the remembrance of the dead. And in the same course up the gulf, others are called Schast Gizer, praise or glory to God, as we may suppose, for the return from this dangerous navigation. Niebuhr and Bruce.

In the "Periplus of the Erythraean sea," by Dr. Vincent, the straits of Babel-mandeb are conducted to 23 miles, and divided into two channels, by the intervention of Perim and other islands; and they open in an easterly direction to Cans or Cape Fatuque on the Arabian side, and to Aramata or Gardefan, on the coast of Africa; which two promontories form the proper entrance to the straits from the Indian ocean, and are about 250 geographical miles asunder.

BABENHAUSEN, a town of Germany in the circle of Swabia, to which belongs a lordship of the counts of Fugger, seated on the Guzzo; 26 miles W. S. W. of Augsburg, and 16 S. E. of Ulm. N. lat. 48° 11'. E. long. 9° 16'.

BABENKOV, a town of Russia, in the government of Archangel, 95 miles S. S. W. of Kola.

BABIA, a river of Russian Lapland, which runs into the White sea, six miles south of Palizada.

BABA, in Mythology, a goddes of Syria, worshipped particularly at Damascus. She was supposed to be the goddess of youth, and to have been Venus, whose pre-eminence in love and marriage. Selden, De Dis Syria, Synag. 11. c. 4.

BABIBA, in Ancient Geography, a town of Africa, in Libya interior, on the Western coast, between the rivers Aradus and Stachis.

BABICA, in Geography, a town of Poland, in the palatinate of Mindk, eight miles east of Myszy.

BABIN, Francis, in Biography, a theologian and canonist of France, was born at Angers in 1651, and elected professor of divinity in the university of his native city. Here he read lectures to numerous classes for 20 years. In 1706, he was appointed by the bishop of Angers one of his grand vicars, and employed to collect and regulate the minutes of the conferences of the diocese. This work was published in 18 volumes 12mo, and is much esteemed for its method and style. In 1697, Babin published in 4to. a work, intitled "A Narrative of what passed in the university of Angers, on the subject of Fanenin and Carteclinin." Louis XIV. allowed him a pension of 2000 livres, and appointed him to several lucrative and honourable offices, which he enjoyed till his death in 1734, at the age of 85. He retained his faculties to the last, and was often consulted on ecclesiastical questions and cases of conscience. Nouv. Dict. Hist.

BABEN, in Geography, a town of Poland, in the palatinate of Lublin; eight miles south-west of Lublin.—Alto, a town of Poland, in the palatinate of Braslawa; twenty-eight miles north-east of Braslawa.—Alto, a town of Poland, in the palatinate of Belez, thirty-six miles east of Belez.

BABINGTON, Germain, in Biography, an English bishop, was born about the middle of the sixteenth century, in Nottinghamshire, as some say, but according to others, in Devonshire, and educated in Trinity college, Cambridge. Whill he was domestic chaplain to Henry earl of Pembroke, president of the council in the marches of Wales, he is said to have afflicted lady Mary Sidney, the countess of Pembroke, in her English metrical version of the Psalms of David. By the inter ed of his patron, he was appointed treasurer of the church of Landaff, and in 1591 became bishop of that see, from which he was translated first to Exeter, and afterwards to Worcestor, where he remained for thirteen years, till the time of his death in 1610. Notwithstanding his liberality in repairing the cathedral of the diocese, and bequeathing to it his library, no monument was erected on his grave. For learning and piety, and as a pathetic and popular preacher, Dr. Bishington has been highly extolled.

He was also humble and diligent, and with the exception of having alienated from the bishopric of Exeter the rich manor of Creden in Devonshire, he has been deemed unobtrusive to the charge of avassor. His works, published in 1615 and 1637, contain "Comfortable Notes on the Pentateuch," an "Exposition of the Creed, Commandments, and Lord's Prayer," a "Conference between Man's Frailty and Faith," and three sermons. They are written in the quaint style of the times, and are distinguished by their piety more than by their literary merit. Log. Brit.

BABINOVITCH, in Geography, a district of the government of Mohile, in Russia, on the river Lutchof, falling into the Duna. N. lat. 54° 52'. E. long. 30° 14'.

BABROSA, BABRONIA, and BABRIBOSA. See BARTROSSA.

BABITZ, in Geography, a town of Bohemia, in the circle of Carlsbad; five miles W. N. W. of Tschich Brodu.

BADEFEUF, a town of France, in the department of the Oise, and chief place of a canton in the district of Noyon; two miles E. N. E. of Noyon.

BABOZLA, a town of Lower Hungary, in Schalvonia, between Poheg and Zigeth, towards the Drave; supposed by some to have been the ancient Manfueifinum, or Pons Manfueifius.

BADOON, in Zoology, the name of that tribe of Aces (Simitia Linn.) which have short tails;—cauda abbreviata; papioœna naiitilu nectarum, Gmel. Linn. Syn. Nat.; and comprehending the species nemetinnis, specia, sphæos, morhn, mânon, and porcaria. The baboons of Dr. Shaw are fuch of the Simitia genus as have very muscular bodies, and whose tails are commonly short. Baboon in the English language has the fame application as babuin in the French, and of which many accounts have been given by Buffon, Sommerv, and others. Virey observes, that the babuinus are a ferocious and very lascivious kind of ape, found in many parts of the old world, and especially in Africa. Their muzzle, he remarks, is a little lengthened in the fame manner as that of a dog, and on that account they have sometimes been called fingers cyanoscephalus, and also magatos. They live on fruits, seeds, roots, leaves, insects, &c. like the other kinds of aces; and are observed to be a mischievous and thievish race. In a state of captivity they are altogether untameable, are fond of wine and Spiritous liquors; and the females it is asserted, have an antipathy to the fair sex, as the males have against men. See Simitia.

BABOPAS, in Geography, a town in the interior part of New Albion, caif of the long range of mountains which extend northward from the head of the peninsula of California. N. lat. 37° 45'. W. long. 114° 25'.

BABORA, a town of Poland, in the palatinate of Lemberg; twelve miles south of Lemberg.

BABOUCARD, in Ornithology, the name given by Buffon to the Senegal variety of Alcedo Ispida (3 Gmelin), or common king-fisher; and which Brison calls Ispida Senegalensis. 311 BABOUIN.
BABOUN, a Museum de Chien, in Somali (ed. D. Dutten, in Zoology, the "Stellipinnias". Jahn; and the ref. cits. Perm. See SIMIA HAMÁDAN.

BABRA, in Geography, a town of North America, in the country of New Naxare; 265 miles south of Cahuiz. 

BABCUB, a small town of Italy, in the Campagna of Rome.

BABY, a town of the East Indies, in an island of the river I. las, sup. by force to be Cambaqui, and by others Patan, stretching out towards the islands Formosa and Leueus.

BABYANES, a cluster of six or seven small islands, about nineteen leagues north of the island of Lagon, in the Pacific ocean; one of them contains about 500 inhabitants; and the chief produce is wax, choya, bananas, cocoa, and plants.

BALEUEA, a town of North America, in the province of Ciliânas; 65 miles north-north of Ciliânas.

BABYAS, in Biography, a celebrated martyr of the Christians, was chosen bishop of the see of Antioch, A. D. 228, under the emperor Gordian; and after governing this church for thirteen years, he either died in prison, or was put to death in the perfecution of Decius. Chry- sotom applauds his courage for refusing admittance into the church to an emperor who had killed the son of a king, whom he had received as an heitage; and this emperor is supposed to have been Philip, who put his colleague, the young Gordian, to death. This is said to have been the cause of the bishop's death. But there are several circumstances that invalidate the truth of this story. However this be, the remains of Babylas were transported about one hundred years after his death, by order of the Cesar Gallus, into the midst of the grove of Daphne, where was a temple of Apollo; a magnificent church was erected over them; a portion of the sacred lands was appropriated to the maintenance of the clergy, and the burial of the Christians at Antioch; and the heathen oracle was silenced, as it was supposed by the presence of the saint's dust, but more probably, as Van Dale suggests (De Oraculis, p. 392.), by an apprehension of the priests, that the Christians, who daily visited the tomb of the martyr, would detect their imposture. Julian, soon after demolished this church; and the Christians removed the relics of St. Babylas, with acclamations of triumph, to their former habitation within the walls of Antioch. On this occasion, Julian exerted his pride to dissemble his repentance; but during the night which terminated this procession, the temple of Daphne was in flames, the statue of Apollo was consumed, and the walls of the edifice were left a naked and awful monument of ruin. The Christians of Antioch confidently asserted, that the powerful intercession of St. Babylas had pointed the lightnings of heaven against the devoted roof. Julian, however, could disguise and restrain his indignation no longer. Imputing the fire of Daphne to the revenge of the Christians, whom he apprehensively denominated Gaiéans, he ordered the doors of the cathedral at Antioch to be shut, and its wealth to be confiscated. For the purpose of discovering the criminals several ecclesiastics were tortured, and a prebendary of the name of Theodorot was heheaded. Eu- feb. E. H. I vi. c. 29. c. 39. Julian in Misopogon, p. 361. Ammianus Març. I xxi. c. 13. Gen. Dict. Gibbon's Hist. vol. iv. p. 121, 14.

BABLON, in Ancient Geography, the capital of the ancient Babylonia, or Chaldaea, supposed to have been situated in N. lat. 34° 34', E. long. 43° 46' 36"; or according to the observations of M. Beauchamp (Mem. Ac. St. Paris, 1737'), N. lat. 32° 34', and E. long. 44° 12' 30". This ancient city, reckoned for many ages one of the wonders of the world, was built on the Euphrates: and its ruins, of the four villages now remain, and placed by most learned writers at a town called Hilla, or Eulus, about fifteen leagues to the south-west of Bagdad. It was fated on a plain, and surrounded by water; and hence appears the propriety of the scripture expression (H. xxi. 1.) the bur- der of the defect of the sea," or rather "of the plain of the sea;" and besides, the places about Babylon, as Aby- denus informs us from Megasthenes (Encl. Prep. Evangel. I. xvi. p. 347.), are said from the beginning to have been overshadowed with waters, and to have been called "the sea." Nevertheless it is no less properly denominated "a mountain." Jer. ii. 35. on account of the great height of its walls and towers, its palaces and temples; and accordingly Eusebius cited by Josephus (ubi infra), lays some of the buildings, that they resembled mountains. It was founded, as some say, by Semiramis, and according to others, by Belus, who is thought by many to be the same with Nimrod. But whoever was the first founder of it, it was in process of time much improved; and Nebuchadnezzar, in particular, repaired, enlarged, and beautified it to such a degree, that he may be said to have built it, according to his own vain-glorious boast Dan. iv. 31. "Is not this great Babylon, that I have built for the house of the king- dom, by the might of my power, and for the honour of my majesty?" Nor is this afforded only in scripture, but it is likewise attested by heathen authors, Megasthenes, Berenec, and Abydenus, whose words are quoted by Josephus (Antig. l. xiii. v. t. t. i. p. 376. ed. Hieron.) and Eusebius (I. xvi. p. 345. ed. Vigil.). By one means or other Babylon became a city to great and famous, that it gave name to a very large empire; and it is denominated by a variety of just and appropriate terms in scripture, such as "great Babylon" (Dan. iv. 1; "the glory of kingdoms," and "the beauty of the Chaldees excellency" (II. xvin. 14; "the golden city") (II. xiv. 4; "the lady of kingdoms" (II. xvin. 5); "abundant in treasures" (Jer. li. 13); and "the praise of the whole earth" (Jer. li. 41.)

The most famous works in and about this ancient city, as they are enumerated and described by Ptolemaeus from ancient authors, were the walls, the temple of Belus, the palace of Nebuchadnezzar, the hanging gardens, the banks of the river, the artificial lake, and the canals.

This city was surrounded with walls, which, according to the account of Herodotus (I. iii. the most ancient author who mentions them, and who himself had been at Babylon, were 87 feet thick, 450 feet high, and in compass 480 furlongs, or 62 miles. Other writers, who differ from Herodotus in some particulars, give nearly the same account of the dimensions of the walls. Dioidorus Siculus indeed (I. ii.) has very considerably diminished the circumference of these walls, and somewhat reduced their height as stated by Herodotus, but he has enlarged their breadth, by saying that six chariots might drive upon them abreast; whereas the former observers, that one chariot only might turn upon them: but then he places buildings on each side of the top of these walls, which, according to him, were only one story high; and thus these two writers may be tolerated reconciled. As for those who affix fifty cubicas as the height of these walls, they represent them as they were after the time of Darius Hystaspes, who had caused them to be beaten down to that level. See Strabo, l. xvi. p. 743. Pliny H. N. I. vi. c. 26. Philostrat. I. l. p. 148.

These walls formed an exact square, each side of which was.
BABYLON.

was 120 furlongs or 15 miles long, built of large bricks cemented together with bitumen, a glutinous slime which sticks out of the earth in that country, and in a short time becomes harder than the brick or stone cemented by it. Without the walls, the city was encompassed by a large ditch, filled with water, and lined on both sides with bricks made of earth dug out of the site of the ditch, whose dimensions are indicated by those of the walls. In the compass of the walls there were 100 gates, or 25 in each of the four sides, all of which were formed of solid bricks, referred to by the prophet Hesiah, ch. xlv. 2. Between every two of these gates were three towers, and four more at the four angles of this large square, and three between each angle and the next gate on either side; and each of these towers was ten feet higher than the walls. This, however, is to be understood merely of those parts of the walls where towers were necessary for defence; for as some parts were faced on a morass, and consequently inaccessible by an enemy, there the labour and expense were spared; and therefore the whole number of these towers amounted to no more than 250. From the 25 gates on each side of this square proceeded 25 streets, extending in straight lines to the corresponding gates in the opposite sides, so that the number of the streets was 50, each of them being about 15 miles long, and all crossing one another respectively at right angles. Besides these there were also four half streets, which were rows of houses, facing the four inner sides of the walls. These latter were properly the four sides of the city within the walls, and each of them was 200 feet broad; the whole streets being about 150 feet in breadth. By this intersecion of the 50 streets, the city was divided into 676 squares, each of which was 14.250 furlongs and a half on each side, or two miles and a quarter in compass. Round these squares on every side toward the streets floor the houses, all of three or four stories in height, and beautified with every kind of ornament; and the space within each of the squares was vacant, and occupied only by courts or gardens, adapted to convenience or pleasure.

A branch of the river Euphrates intersected the city, running through the middle of it from north to south; and over the river, in the central part of the city, was a bridge, a furlong, as some say, but according to others, much more, in length, and thirty feet broad; which bridge was ingeniously constructed, in order to supply a defect in the bed of the river, which was composed of sand. At the two ends of this bridge were two palaces; the old palace on the eait side, and the other on the west side of the river; the former occupying four of the above-mentioned squares, and the latter nine. The temple of Belus, which stood next to the old palace took up another of these squares.

The whole city stood on a large plain, in a flat and deep valley; part or half of it which lay on the eait side of the river was the old city; the other on the west was added by Nebuchadnezzar; and both were included within the square, bounded by the walls already described. The form of the whole was seemingly borrowed from Nineveh, which was also 480 furlongs in compass, but its form was that of a parallelogram, whereas that of Babylon was an exact square. Nebuchadnezzar, who had destroyed that old seat of the Assyrian empire, is supposed to have designed that this new one should exceed it in size and in magnificence. It appears, however, that it was never wholly inhabited, though Nebuchadnezzar carried thither a great number of captives out of Judea and other conquered countries; nor was time allowed for its arriving at that population and glory, which were the objects aimed at by Nebuchadnezzar; for Cyrus removing the seat of empire to Shushan, Babylon gradually sunk into utter decay. When Alexander came to Babylon, we learn from Quintus Curtius, that no more than 8,000 square furlongs were then occupied by buildings; but the whole space within the walls contained 14,000 square furlongs; and therefore there must have been 6250 square furlongs, which, as Curtius informs us, were ploughed and sown. Nor indeed were the houses contiguous, but a void space was left on each side between one house and another.

According to the observations of Major Kennell (Geographical System of Herodotus examined and explained, &c. p. 331), there seems to be no mode of invalidating the fact respecting the extent of the space inclosed by the walls of ancient Babylon: "nor, says he, can it be unfair idea be reduced to less than a square of about 81 British miles, giving an area of 72 square miles. But that even 72 contiguous square miles should have been in any degree covered with buildings, is on every account too improbable for belief."

The inhabitants of London, taken at a small part of the whole population of South Britain (say about 7,000,000, or for London 800,000), require for their supply of provisions and necessaries, a proportion of land equal to about 6600 square British miles, on a supposition that they were confined to its produce alone, and that it was taken as it generally runs throughout the kingdom." If there be allowed to Babylon an area of seventy-two miles, we conceive that it would then bear a proportion to the space which the buildings of London occupy, taking in all its suburbs and members, whether contiguous or otherwise, and allowing the usual area of 15 British miles, as 9 is to 2 nearly. As to all the large Asiatic cities that we have seen or heard of, scarcely contain within the same space half the number of inhabitants that European cities do, we must reckon the proportion of population that Babylon would have contained to that of London, as 9 to 4. In this case 15,000 square miles of such land as the common run of that in England would have been required for the support of the people of Babylon. But as the simpler manner of living among the lower classes of people in Asia requires a less quantity of land to support it a considerate deduction may be made, and instead of 15,000 square miles, we may perhaps subsume 12,000. Now it will appear that this reduced sum of square miles equals, within one-twelfth part, the whole area of Lower Mesopotamia; and even the whole tract properly denominated Babylon and Chaldea, including all the arable and pasture land, from whence Babylon could have been conveniently supplied by the inland navigation, was little more than double the above aggregate, taken at 13,000 square miles. And though it be true, that the quantity of the Babylonian lands, in such places, was superior in fertility to that of England; yet, on the other hand, a prodigious deduction must be made for the marshes and lakes of Lower Mesoopotamia and Chaldea." Hence the author very justly infers, that the houses occupied only a part of the wall space inclosed by the walls, and he further adds, "a modern instance in the same region of a city inclosed by a wall seven miles in circuit; and yet Bath 14 miles only from 40 to 50,000 inhabitants; the wall including date groves and corn fields. Besides, it should be remembered that the Euphrates flowed through the centre of Babylon, in which part of its course it is from 300 to 500 feet wide. The palace of the Babylonian kings, the temple of Belus, and other public buildings must also have occupied a considerable part of the space within the walls, 14,000 square miles.

The next object particularly worthy of notice in the city of Babylon, was the temple of Belus. In the middle of this temple stood the ancient tower, proposed by Bechart 3.11.
BABYLON.

(Phæleg. p. i. l. i. c. 9.) to have been the famous tower of Babylon. This tower was at its base a square of a furlong on each side, or half a mile in compass, and consisted of eight towers, as they appeared to be, built one above the other, the height of each being 75 feet, and that of the whole 600 feet. The ascent to its top was by flights on the outside, formed by a sloping line from the bottom to the top eight times round it, so as to exhibit the appearance of eight towers. As these compartments or stories had many rooms with arched roofs supported by pillars, they made parts of the temple, when the tower became consecrated to idolatrous purposes. The uppermost story was the most sacred, and the most suitable to the uses of devotion. Over the whole of the top of the tower there was, it is said, an observatory (Diod. Sic. i. ii.), by the advantage of which the Babylonians extended their skill in astronomy beyond other nations. For when Alexander took Babylon, Callisthenes the philosopher, who accompanied him thither, found they had astronomical observations for 1903 years from that time, which carried up the account as high as the 115th year after the flood, or within 15 years after the tower of Babel was built, or to the year B.C. 2354. Till the time of Nebuchadnezzar, the temple of Belus contained only this tower, the rooms of which served all the occasions of its idolatrous worship. But he enlarged it by erecting edifices round it in a square of two furlongs on every side, and a mile in circumference, exceeding the square at the temple of Jerusalem by 1800 feet. The whole of these buildings was enclosed by a wall, which is computed to have been two miles and a half in circumference. In this wall were several gates of solid brass suppos'd to have been formed out of the bronze sea, brazen pillars, and other vessels and ornaments, which Nebuchadnezzar had brought to Babylon from Jerusalem; for he is said to have dedicated in this temple the spoils of that expedition. Dan. i. 2. 2 Chron. xxxvi. 7. In the same places were several images or idols of maily gold; one of them which was a statue of Belus, in an erect posture forty feet high, crowning the summit, and reposing on a pedestal of fifty feet in height. As this is said to have weighed 1000 Babylonian talents, it is computed to have been worth three millions and a half of our money. According to Diodorus Siculus (ubi supra), the weight of the statues and decorations amounted to five thousand and odd talents in gold, and their value has been estimated at above twenty-one millions of our money; and the like sum is allowed for the treasures, utensils, and ornaments.

On the east side of the river stood the old palace of the kings of Babylon, four miles in circuit; and opposite to it, on the other side of the river, was the new palace built by Nebuchadnezzar, which was eight miles in circumference.

For an account of the hanging gardens of Babylon, see Pausanias. Horti. The other works ascribed to Nebuchadnezzar, by Berosus and Abydenus, were the banks of the river, the artificial canals, and the completion of the artificial lake, said to have been sunk by Semiramis. The canals were cut out on the east side of the Euphrates, in order to convey the waters of the river, when it overflowed its banks, into the Tigris, before they reached Babylon.

The chief of these was the Naarmalcha. The lake was on the west of Babylon, and, according to the lowest computation, 40 miles square, 160 in compasses, and 35 deep as Herodotus says, and 75 according to Megasthenes. It was dug to receive the waters of the river, while the banks were building on each side of it; but the lake, and the canal that led to it, were afterwards preserved, and found useful to prevent inundations, and to serve as a reservoir, from which water was occasionally let out by sluices for improving the land. The banks were constructed of bricks and bitumen, on both sides of the river, to keep it within its channel, and were extended through and beyond the city, occupying an interval of twenty miles. Opposite to each street, on either side of the river, was a brazen gate in the wall, with towers leading down from it to the river; which gates were open in the day, and shut in the night.

All these works are attributed by Berosus, Megasthenes, and Abydenus, to Nebuchadnezzar; but Herodotus says that the bridge, the banks, and the lake, were the work of a queen who reigned after him, called Nitocris, who probably finished what Nebuchadnezzar had begun and left imperfect. Babylon fulfilled with singular reputation, and was for a long time considered as one of the wonders of the east. At length Cyrus, having subdued the several nations that inhabited the great continent from the Egean sea to the Euphrates, and likewise Syria and Arabia, entered Assyria, and directed his march towards Babylon. Nabonadius, Labynitus, or Belhazzar, who reigned at Babylon, hearing that he was advancing to his metropolis, marched out to give him battle; but being put to flight, he returned into the city, where he was closely besieged by Cyrus. But the capture of a place so strong, and furnished with all kinds of provisions for twenty years, was no easy enterprise. Despairing of succeeding against it by force, he drew round it a line of circumvalation, with a large and deep ditch, to intercept its communication with the country. He also divided his army into twelve bodies, each being appointed to guard the trenches for a month; but the besieged, triumphing in the height of their walls, and the amplitude of their stores, insulted Cyrus from the ramparts, and seemed to defy all his efforts. Cyrus, having spent two years before Babylon without making any impression, adopted the following stratagem, which proved successful. Informed that a great annual solemnity was to be kept in the city, and that the Babylonians were accustomed, on this occasion, to spend the whole night in drinking and debauchery, he thought this a proper time for surprizing them. Accordingly he sent a strong detachment to the head of the canal leading to the great lake, already described, with orders, at an appointed time, to break down the bank which separated between the lake and the canal, and to turn the whole current of the river into the lake. At the same time he appointed one body of troops to occupy the place where the river entered into the city, and another to flation themselves where it came out; and he ordered them to march in by the bed of the river, which was two fathoms broad, as soon as they should find it fordable. Towards the evening he opened the head of the trenches on both sides of the river above the city, that the water might discharge itself into them, and by these means, and the breaking down of the great dam, the river was soon drained. Then the two bodies of troops above-mentioned entered the channel, according to the instructions which they had received; and advancing towards the city, they found the gates left open, in consequence of the riot and disorder of the night, and penetrated into the city without opposition. Meeting at the palace, according to their previous agreement, they surprised the guards, and cut them in pieces. Those who were in the palace, opening the gates to know the cause of the confusion, made way for the Persians to rush in: and thus they took possession of the palace and killed the king, who with his sword in his hand came out to meet them. The king being killed, and those who were about him being put to flight, the rest submitted, and the Medes and Persians became masters of the place; B. C. 538. The reduction of Babylon put an end to the Babylonian empire, and finally fulfilled, in the name and character...
rader of the conqueror, and in the various circumstances that attended this event, the prophecies which Isaiah, Jeremiah, and Daniel, had uttered against this proud metropolis. However, the tower or temple stood to the time of Xerxes; but in his return from the Grecian expedition, he first plundered it of its wealth, then demolished the whole, and laid it in ruins. Alexander, on his return to Babylon from his Indian expedition, proposed to rebuild it, and to make it the seat of his empire; but his death prevented his accomplishing that design. After the death of Alexander, the city of Babylon began to decline speedily, and its decay was directly owing to the vicinity of Seleucia, which was built by Seleucus Nicator, as it is said to mortify the Babylonians, and populated with 500,000 persons drawn from Babylon.

We learn further from a fragment of Diodorus Siculus, produced by Valeius, and quoted from him by Vitringa (Comment. in Sacram. c. 13. vol. i. p. 421.), that a king of Parthia sent many of the Babylonians, under the most trivial pretences, into slavery, burnt the forum and some of the temples of Babylon, and demolished the best parts of the city. This happened about 150 years B. C. Diodorus Siculus (i. ii.) describes the buildings as ruined or destroyed in his time (B. C. 44.), and affirms that only a small part of the city was inhabited, but that the greatest part of it within the walls was titles. Strabo (i. vi. p. 1073.) wrote not long after Diodorus (B. C. 105.) says, that part of the city was demolished by the Persians, and part of it decayed by time and the neglect of the Macedonians, particularly after the building of Seleucia, and the removal of the royal court thither. Strabo applies to Babylon what a comic poet said of Megalopolis in Arcadia: "The great city is now become a great desert." Pliny also (H. N. i. 6. c. 30.) affirms (A. D. 66.), that it was reduced to solitude by the neighbourhood of Seleucia. Pausanias, about A. D. 153, compares Megalopolis to Babylon, and says (Arcad. c. 35. p. 668. ed. Kuhnii), that of Babylon, the greatest city which the sun ever saw, nothing remained but the walls. Maximus Tyrius (Diff. 6.) mentions it as lying neglected and forsaken, and Lucian intimates (Peri cors., fifth Contemplators), that in a little time it would be fought for and not be found, like Nineveh. Constantine the Great, in an oration preferred by Eusebius, says, that he himself was upon the spot, and beheld the desolate and miserable condition of the city. In the time of Jerome, about the close of the fourth century, it was converted into a chase for keeping wild beasts within the compass of its walls, for the hunting of the later kings of Persia. St. Jerome adds, that, excepting the brick walls, which after many years are repaired for the inclosing of wild beasts, the whole space within its defoliation. Hieron. Comment. in Isai. c. 15. c. 14. vol. iii. p. 111. 115. ed. Benedict. Benjamin of Tudela, who lived in the twelfth century, affirms (Itin. p. 76.), that ancient Babylon is now laid walled, but that some ruins are still to be seen of Nebuchadnezzar's palace, into which men fear to enter on account of the serpents and scorpions that are in the midst of it. Tvecina, a Portugueze, in his description of his travels from India to Italy, cited by Bochart (Phileg. l. 4. c. 15.), and by Pridaques (pt. 1. b. 8. a. affirms, that of this great and famous city nothing but a few vestiges remained, and that there was not any place in the whole region less frequented. Rauwolf, a German traveller, whose travels have been edited by Ray, passed this way, A. D. 1574, and describes the ruins of this famous city, which he found in the village of Elugs, not far from Bagdad. He mentions some piers and arches of the old bridge over the Euphrates, and the ruins of the cafile and tower, which are the habitations of venomous creatures, that are so dangerous as not to be accessible with safety, except during two months in winter, when these animals never stir out of their holes. Petrus Valensiis, or Delia Valles, was at Bagdad in 1616, and visited the ruins, as they are thought to be, of ancient Babylon, which he says, appear in confusion like a huge mountain, and exhibit a mass corresponding in form and situation to the pyramid called by Strabo the tower of Belus, and being probably the tower of Nimrod in Babylon, or Babel, as the place is called. But besides this large mass, there are no traces of ruins sufficient to convince an observer that so great a city as Babylon was ever situated in that place. Tavernier says, that at the parting of the Tigris, which is but a little way from Bagdad, there is the foundation of a city which may seem to have been a large league in compass. Some of the walls, he says, are yet standing, upon which fish cooks may pass abreast. They are made of burnt brick, ten feet square and three thick. The chronicles of the country represent this as the site of the ancient Babylon. But this intelligent traveller adopts the opinion of the Arabs, and conceives the ruins observed by himself, and also by Benjamin the Jew, Rauwolf, and Delia Valles, to be the remains, not of Nebuchadnezzar's palace, or of the tower of Babel, but of some tower built by one of their princes, and designed as a beacon to assemble his subjects in time of war. Hanway (Trav. vol. iv. pt. 3. c. 10. p. 178.) says, that the ruins of Babylon, placed on the north of the road from the south of Bagdad, are now for so much effaced, that there are hardly any vestiges of them to point out the situation.

Whoever compares these accounts, given more in detail by the authors above cited, with the predictions of the ancient prophets, will perceive, and be led to acknowledge, how punctually the ravages of time have contributed to accomplish them. To this purpose bishop Newton observes (Differt. on the Prophecies, vol. vii. p. 285.), that when Babylon "was converted into a chase for wild beasts to feed and breed there;" then were exactly accomplished the words of the prophets, that "The wild beasts of the desert, with the wild beasts of the islands, should dwell there, and cry in their defolated houles." One part of the country was overflowed by the river's having been turned out of its course, and never restored again to its former channel, and hence became boggy and marshy, so that it might literally be said to be "a pollution for the bittar, and pools of water." Another part is dereried as dry and naked, and barren of every thing, so that thereby was fulfilled another prophecy, which seemed in some measure to contradict the former, "Her cities are a defoliation, a dry land and a wilderness, a land wherein no man dwelleth, neither doth any son of man pass thereby." The place thereabout is represented as overrun with serpents, scorpions, and all sorts of venomous and unclean creatures, so that "their houses are full of doleful creatures, and dragons cry in their defolated places; and Babylon become heaps, a dwelling for dragons, an abomination and an hillaring, without an inhabitant." For all these reasons, "neither can the Arabian pitch his tent there, neither can the shepherd water the folds there." And when we find that modern travellers cannot now certainly discover the spot of ground whereon this renowned city was once situated, we may very properly say, "How is Babylon become a defoliation among the nations! Every purpose of the Lord hath he performed against Babylon, to make the land of Babylon a defoliation, without an inhabitant:" and the expression is no less true than sublime, that "The Lord of holies hath swept it with the beom of destruction.">" How wonderful (adds the prelate) are such predictions compared with the events, and what a convincing argument of the truth and divinity of the holy scriptures! Well
BAB

night God allege this as a memorable influence of his preference, and challenge all the false gods and their votaries to produce the like. If xlv. 21. xlvii. 10. And indeed where you can find a similar influence, but in Scripture, from the beginning of the world to this day?" The triumphant ode upon the fall of Babylon, recited in the fourteenth chapter of Isaiah, merits particular attention, as it is truly admirable for the fervent lyrics of irony, as well as for the sublime strains of poetry. "The Greek poet Alcucus, who is celebrated for his hatred to tyrants, and whose odes were animated with the spirit of liberty no less than with the spirit of poetry, we may presume to say, never wrote anything comparable to it." Bishop Lowth, in his excellent lectures upon the sacred poetry of the Hebrews, hath justly described it as one of the most spirited, most sublime, and most perfect compositions of the lyric kind, superior to any of the productions of Greece or Rome. See his Preached. xiii. p. 170, &c. Preached. xviii. p. 277, &c. Mr. Masius hath also imitated it in an English ode, published with some other odes, in 1756.

BABYLON, a city of Egypt, which was watered by the river Trajanus, according to Ptolemy. It was situated near the Nile, where Grand Cairo now stands, or at a small distance from it, and had a castle strongly fortified both by nature and art. Some say, that it was founded by the Persians when they ravaged Egypt under Cambyses, (B. Bel.) when Crassus Antioch, and that it was erected in the place where Latopolis stood; or according to others, when Semiramis visited this country at the head of a formidable army, Strabo says (I. xvii.), that it was built by some Barbarians, who retired thither by permission of their sovereign, and that in his time the Romans kept in garrison there one of the three legions that were stationed in Egypt. From the fortresses of Babylon, the mountain gently sloped to the bank of the Nile; and 150 stades were continually employed there in raising the water by means of wheels and an aqueduct. The Persians, who were worshippers of the sun, kept up a perpetual fire in this place, which occasioned its being called by the Arabs "The castle of the lights." See Cairo, and Fostat.

BABYLON, in Scripture History, is a name figuratively given by the sacred writers, particularly by St. Peter, 1. Ep. ch. v. v. 13. and by the author of the Revelations, ch. xvii. and xviii., and also by the fathers, to Rome: partly on account of her greatness, pride, and appellation of God's people, and partly for her resemblance of it in idolatry; that kingdom so fully representing the idolatry of the church of Rome in the description given of it in the sixth chapter of Baruch, that fearfully any real difference between them can be observed. Whitby's Paraphrase, vol. ii. p. 661. p. 753.

BABYLONIA, or CHALDAEA, an ancient kingdom of Asia, was founded by Nimrod, the grandson of Ham, and continued distinct and separate from that of Assyria, till Ninos conquered Babylon, and made it tributary to the Assyrian empire. (See Assyria.) This country was known in ancient times, by the names of Shinar, and Shihara, which appellation it seems to have retained even in the time of Daniel. The name of Babylon is universally supposed to have been derived from that of the tower of Babel; and the name of Chaldaea arose from the Chaldeans, or Chaldan. (Joseph. Ant. i. i. c. 7.) These two names sometimes extend to the whole country, being indifferently taken for each other; and sometimes they are limited to certain parts. By Babylon, or Babylonia, is meant the country more immediately in the neighbourhood of the city of Babylon; and by Chaldaea, that which extends southward to the Persian gulf. Chaldaea is used by the writers of the Old Testament for the whole country (Jer. xxv. 4. xxv. 12. 1. 8. Ezek. xiii. 15; and Babylonia, generally speaking, by profane authors. (Diodor. Sic. i. c. 11. 12. Strabo, i. xvi. sub. init.) It lies between thirty and thirty-five degrees of north latitude; and was bounded, according to Ptolemy, on the north by Mesopotamia, on the east by the Tigris, on the west by Arabian Deserts, and on the south by the Persian Gulf and part of Arabia Felix. In Babylonia, properly so called and considered as a distinct province from Chaldaea, were the following cities; viz., Babylon, the metropolis, (See Babylon); Vologaesus, or Vologojercota, built on the Euphrates by Vologesis, king of the Parthians, in the time of Vep-sian; Barbita, probably Strabo's Borippa, sacred to Diana and Apollo, famous in the time of this geographer for a woollen manufacture, and for being the habitation of a certain sect of Chaldæans, thence called Donippones; Idicarca, on the Euphrates and the borders of Arabian Deserts; Cacce, in the island Mene, formed by the Tigris; Saura; and Pombeditha, of which the situation is very uncertain. In ancient times the Babylonian name, extending far beyond the limits both of Babylonia and Chaldaea, comprised all, or the greater part of the provinces subject to the Babylonian empire. See Eschat.

The air of this country was generally temperate and salubrious; though it was occasionally subject to extraordinary heat and a pestilential wind. As it seldom rained, the inhabitants were under the necessity of watering their lands by means of wheels and engines, and of trenches and canals, which flowed from the Euphrates to the Tigris. The soil was rich, the climate was for the most part excellent, and the inhabitants were industrious; and therefore this country vied, in respect of fertility, with any other spot on the face of the earth. The southern parts of it, between the rivers, have been compared with the Delta of Egypt, which it resembles by its natural and artificial islands, and by being almost under the same parallel of latitude; and the northern part, or Chaldaea properly so called, between the Euphrates and the mountains of Babylon, as they are commonly termed, is not much less watered by rivers and canals conducted from the Euphrates, and large reservoirs of lakes borrowed from the same river. Hence Herodotus (i. c. 191), compares this country with Egypt; and he says, that, with regard to the plenty of its productions, it was reckoned to be equal to a third part of Asia, or of the Persian empire; and that, in the same year, it yielded 300 talents of gold, but generally 200. As it was low, flat, and well watered, it abounded with willows, and was called "the valley of willows," as Prideaux, Com. p. i. b. 1. p. 105; after Bochart, corrects the text, Is. xv. 7. The palm also flourished naturally every where, and particularly the date kind, which afforded bread, wine, and honey; but the vine, olive, and fig-tree, did not succeed here any more than in Egypt. But as to grain, it exceeded every other land; the millet and feemak being the rooted up to the size of trees; and the loaves of barley and wheat were usually four fingers broad. The fig-tree afforded oil, instead of the olive; and the palm yielded wine instead of the grape. This fertility was owing in a great measure to the inundation of the Euphrates and Tigris, in the months of June, July, and August; the frou of the mountains of Armenia melting in those months; and to guard against injury from these inundations, the inhabitants formed artificial rivers and canals, by which they distributed the waters, and maintained thus easy communication with one another. For the purpose of mutual intercourse, and particularly of navigating the Euphrates, they had boats, of a round form, constructed like wicker-baskets, which were covered
cease with hides, and guided by two oars or paddles. They had neither head nor item; but being of different sizes, they served for carrying various quantities of their commodities to Babylon, whence they returned by land, the rapidity of the stream not allowing them to return by water.

The government of Babylon, like that of Assyria, was despotic, and the fepteet from that time have been hereditary. There were three in each family, who received divine honours, and governed their country by a variety of officers, civil and military; and these were divided into three classes: the first had the charge of vigils, and of their disposal in marriage, and were to judge in cases of adultery, and similar matters; the second took cognizance of thefts; and the third of all other crimes. The chief officers of the king's household were the captain of his guard, who had the execution of his arbitrary andimaginatory commands; the prince of the eunuchs, who had the charge of the education and sublimation of the youth of the palace; and the prime minister, resembling the Turkish vizier, who sat in the king's gate; as it was called, to hear complaints, and to pass judgment. Besides these, there was also a master of the magistrates, who presided in the courts to satisfy the king on subjects that respected the proclivity of futurity. Among their laws, which were vague and variable, one of the bell deemed to have been that which respected marriage, and which was calculated to increase the number of inhabitants; for, which, see Assyria. Their punishments were arbitrary, and depended upon the will of a capricious monarch. Beheading, cutting to pieces, turning the house of the criminal into a dunghill, and burning in a fiery furnace, were penalties, which were executed by order of the kings of Babylon. The religion and boasted learning of the Babylonians were so blended together, that they are not easily separated: for the Chaldees, properly so called, were not only their priest, but also their learned men; whole science seems to have been subservient to the purposes of superstition. (See Belus, and Nabataem.) As the Babylonians gave rise to all the idolatries and superstitions that prevailed among the neighbouring nations, they are charged with having introduced the horrible custom of sacroligizing human victims, in order to appease or conciliate their deities. The Babylonians were much addicted to judicial astrology; and ascribed an influence to the stars and planets, in the explication of which their chief science consisted. Astronomy was with them subservient to astrology, and the former was cultivated in subordination to the latter. Indeed, the principal part, if not the whole, of their philosophv and learning, constituted the application of this fanciful and unfounded science. However, some have discriminated, with justice, between the Chaldees, and Babylonians, ascribing to the latter a more accurate and extensive acquaintance with the principles of astronomy, mathematics, and mechanics, than the former. (See Chaldean Philosophy.) Of their music and poetry we have few certain records. They are said to have excelled in architecture and sculpture, in the arts of designing, and of cutting metals, as the ornaments of their metropolis seem to testify. Their manufactures, particularly of rich embroideries, sumptuous vestments, magnificent carpets, and fine linen, were famous; and they sent their purple into the eastern parts as an article of traffic. Their commerce, especially when Babylon was in the meridian of her glory, must have been considerable. The metropolis was advantageously situated for this purpose; being as it were in the midst of the world, and having, by means of the Tigris and Euphrates, a easy communication with the western and northern parts, and also with the eastern by means of the Persian gulf. With regard to their schools, we may mention in particular their mode of treating sick persons. Having no physicians, they exposed them publicly in the most frequented places, that all who law them might offer their advice, if they had, either from their own experience or that of others, any knowledge of their case. Their death they embalmed with honey and wax, and their manner of mourning resembled that of the Egyptians. The Babylonians were of a high degree of credulity and superstition; and much addicted to licentiousness and debauchery in their general conduct. In their dress, they affected pride and effeminacy. Their under garment was a linen veil, which hung down to their heels; over this they had another of woolen; and their outer garment was a white mantle or cloak. They suffered their hair to grow; adorned their heads with a turban or mitre; and anointed their bodies with the oil of feme. Every individual wore a ring with a seal on his finger, and bore in his hand a carved staff or sceptre, the head of which was adorned with some figure, as that of an apple, rose, lily, eagle, or some such emblem. On their feet they wore a kind of slippers. The inhabitants of this country were divided not only into two great tribes, the Babylonians, and Chaldeans, properly so called, but into other subordinate sects. Three of these are said to have fed upon nothing but fish, which they dried in the sun, and formed into pills, thus supplying the want of bread.

As to the history of the kingdom of Babylon, distinguished from the kingdom of Assyria, the first king of this country mentioned in Ituley's Astronomical Canon, is Nabonassar, to whom Pul or Pol bequeathed it, as he did that of Assyria to Turgath-Pilefer, in the year 747, B.C. The latter reigned at Nineveh; and the former at Babylon. From this period commonly denominated the era of Nabonassar, to the year 665 B.C. when Nabopolassar began his reign, nothing remarkable occurs in the history of the kings of Babylon excepting that Assuradinus or Esharaddon, king of Assyria, the brother and successor of Senacherib, took possession of the kingdom of Babylon in B.C. 680; and that upon his death, their kingdoms of Assyria and Babylon were again separated, B.C. 668. In the twentieth year of Nabopolassar, B.C. 606, Nineveh was taken and destroyed by the united armies of Cyaxares and Nabopolassar, and the feat of the empire transferred to Babylon. This Nabopolassar, sometimes called Nebuchadnezzar, was the father of the famous Nebuchadnezzar, or Nabopalese, whose history occurs in the sacred writings, and who commenced his reign in the year 604 B.C. From this period, to the conquest of Babylon by Cyrus, in the reign of Nabonadius, Babylon, Sibonius of Herodotus, and Belhazir of Scripture, the son of Eder-Merodach by Nitocris, and the grandson of Nebuchadnezzar, in the year 538 B.C. the history of Babylon presents nothing worthy of particular notice. For an account of the conquest of Cyrus, which terminated the Babylonian empire, and subjected it to the Persians, see BABYLON. From this time, Babylon was never erected into a distinct kingdom, but has shared the vicissitudes of the great conquerors who have at different times appeared in Asia. It is now frequently the object of contention between the Turks and Persians. Anc. Un. Hist. vol. iii. p. 367—437. Rollin's Anc. Hist. vol. ii. p. 1—153.

BABYLONIAN, BABYLONIC, of BABYLONISH, Capiti- nity, Empire, Epocha, Genoral, Hour, Talmud, Year, &c. See the several articles.

BABYLONICA TEXTA, in Antiquity, denote a rich sort of weavings or hangings, denominated from the city of Babylon, where the practice of interweaving divers colours in their hangings first obtained. Philo, H. N. Lib. viii. p. 32. Hence also Babylonian garments, Babylonian skins, Babylonian carpets, houings, &c.; and Babylonica solana, which were
were coverings laid over couches, &c. painted with gold, purple, and other colours.

Babylonian, Babylonian, is also used in some Ancient Writers, for an astrologer, or any thing relating to astrology; hence Babylonica Cursa, the art of calling nativities; and numeri: Babylonii, the computation of astrologers. Hor. lib. i. od. 12.

Babylonics, or Chaldæics, in Literary History, a fragment of the ancient history of the world, ending at 267 years before Christ; and composed by Berosus or a priest of Babyl., about the time of Alexander. Stanley Hill. Phil.

The Babylonics were very consonant with Scripture, as Josephus and the ancient Chaldaic chronologers affirme us; whence the author is usually supposed to have confuted the Jewish writers. He speaks of an universal deluge, an ark, &c.; he reckoneth ten generations between the first man and the deluge; and he marks the duration of the several generations by Sauri or periods of 253 lunar months, which reduced to years, differ but little from the chronology of Moses. There now remain only a few imperfect extracts, preferrd chiefly by Josephus and Syncellus. They were forged by Annis of Viterbo. Fabr. Bibl. Græc. tom. xiv. p. 175. See Berosus, and Chaldaean Philosophy.

Babysrs, in Ancient Geography, a strong place of Armenia Major, situate in the mountains, near Artasates, where were kept the treasures of Tigranes and Artabazus.

Babysrs, in Zoology, a species of Sus, or hog, having two tusks growing from the lower part of the back. This is the horned-hog of Grew; porcus indicus babysrus dictus of Ray; and bab-ryussa of Buffon. In the arrangement of the French naturalists, it belongs to the genus of swine and order pac杨幂s.

The babysrus is described by Dr. Shaw, to be nearly of the size of a common hog: but of a somewhat longer form, and with more slender limbs; and to be covered, instead of bristles, with fine, short, and somewhat woolly hair, of a deep brown or blackish colour, interpersed with a few bristles on the upper and hinder part of the back. It is also distinguished by the very extraordinary polish and form of the upper tusks, which instead of being situated internally on the edge of the jaw as in other animals are placed externally, perforating the skin of the mouth, and turning upwards towards the forehead; and as the animal advances in age, becoming so extremely long and curved as to touch the forehead. These continue their curvature downwards, by which means they must of necessity lose their power as offensive weapons, which they probably possess in the younger animals; the tusks of the lower jaw are formed as in the rest of the genus, and are also long, sharp, and curved; but not of equal magnitude with those of the upper. The upper tusks are of a fine hard grain, like that of ivory; the eyes are small; the ears somewhat erect, and pointed the tail rather long, slender, and tufted at the end with long hairs.

The babysrus is a precarious animal, and is found in large herds in many parts of Java, Ambon, and some other Indian islands, but is said never to be found on the continent of India. Their food is entirely of a vegetable nature, and they often feed on the leaves of trees. When sleepimg, or retining themselves in a flandering posture, they are said often to hook or support themselves by placing the upper tusks across the lower branches of the trees. When pursued, they will often plunge into a river, or even into the sea, if near, and can swim with great vigour and facility, and to a vast distance. The voice of the babysrus is said to resemble that of the common hog, but it occasionally utters also a strong or loud growling note. It is sometimes tamed by the inhabitants of the Indian islands, and the flesh is considered as wholesome food, Vide Shaw Gen. Zool. Erxleben, &c.

Some writers imagine this quadruped to have been mentioned by Urian, Pliny, and other ancient writers. It is thought to be the animal noticed under the name of tetrachromes, or four-horned, by the former; and that kind of Indian boar, described by Pliny as having two very long bent teeth in the lower jaw, and two others rising in front. Aper in India, Aper cotura, &c. Aper comatus. Calpurn; aper indicus orientalis babi mela dicitus, Seba; farange hogs, hogs with horns, Porch. pilgr.; cherhirefh or hirschner, Knorhelic, &c.

Babyseng, in Ancient Geography, an ancient town of India, on the other side of the Ganges. Ptolemy.

Babysrus, in Ancient Geography, a town of Asia, seated on the northern bank of the Tigris. Pliny.

Bac, in Navigation, is used for a pram or ferry-boat.

Bac, in Brewing. See Back.

Baca, or Bacatha, in Ancient Geography, a village of Palestine, which served as a boundary between the Tyrians and Galilees.

Baca, in Geography, a town of North America, in New Navarre, forty miles north-east of Cinaloa.

Baca. See Baza.

Bacacum, or Baccacum, in Ancient Geography, a town of the Nevis, in Gallis Belgica: now Baxcy.

Bacaduchi, in Geography, a town of North America, in New Navarre, 240 miles north of Cinaloa.

Bacaime, or bacalim. See Basseen.

Bacala, a town of India, on this side of the Ganges, on the eastern coast in the kingdom of Arracan.

Bacalal, a lake and small country of North America, in the peninsula of Yacuan.

Bacalan, a town of Alia, in Tokareflan, one of the southern provinces of Great Bucharia, at a small distance N. W. from Andera. N. lat. 36° 12'. E. long. 67° 35'.

Bacaleo, Bacalieu, Bacollom, or Baccolan, an island on the east coast of Newfoundland, about nine leagues from cape St. Francis, and eight leagues north by eail from Portugal cove, is about two leagues long, and half a league broad. This island is about a league from the main, with a fair channel between for any ships. N. lat. 48° 24'. W. long. 52° 54'.

Bacam, a town of North America, in New Navarre, 165 miles north-west of Cinaloa.

Bacano, a small lake of Italy, near a village of the same name, in the patrimony of St. Peter, out of which flows the small river Cremera.

Bacanora, a town of North America, in New Navarre, 230 miles south of Cafa Grand.

Bacantib, in Ecclesiastical Antiquity, wandering clerks, who itrolled from church to church. Bingham.

The word feems formed by corruption from vocantiti.

Bacapa, in Geography, a town of North America, in New Navarre, 120 miles south-west of Cafa Grand.

Bacar. See Bahar.

Bacarat, or Baccarat, a town of France, in the department of the Meuse, and chief place of a canton in the district of Lunelville; four leagues south-east of Luneville. The place contains 1315, and the canton 14,759 inhabitants: the territory includes 315 kilometres and 31 communes.

Bacardo, a town of Italy, in the flate of Genoa, three miles N. N. E. of Viutimiglia.

Bacaseray, or Baktschisaray, a town in the peninsula of the Crim-Tartary, where the khan usually resided, seventy miles south of Perekop. It was partly burnt by the Russians in 1736. N. lat. 45° 30'. E. long. 35° 10'.

Bacay, a town of India, on the other side of the Ganges.
Ganges, the capital of a country of the same name, on the eastern bank of the river Ayn.

BACBAKIRI, in Oryzabolus, the name by which le melé "pallur noir de Ceylon of Boston, is known at the cape of Good Hope; because its note very exactly expresses the syllables bac-ba-kiri. This is the green-pye from Ceylon of Edwards; Ceylon thorn of Latham; and turdus Zeylonus of Linnaeus.

BACCA, BERRY, in Botany, denotes such fruits as consist of a pericarpium full of juice and seeds, without any valves. The seeds have no membranous case or covering, but are disposed promiscuously throughout the pulp, as in pomegranate, &c., and are generally placed on foot-stalks attached to receptacles within the pulp, as in rubus, &c. The berry is said to be proper when it is a true pericarpium, formed of a germin and impregnated, when it is formed from other parts of the fructification, as in morus, roda, juniperus, taxus, &c. A large succulent calyx becomes a berry; in junipers the three petals become the umbilics; in poterinum the berry is formed of the tube of the corolla; in fragaria, &c., it is formed of the top of the receptacle; in rubus, &c., it is formed from a seed, which is the receptacle of the berry; in rubus, &c. It is inclosed within, and is part of the necary. The berry is commonly either round or oval; and is frequently furnished with an umbilics, as in rubus, &c. It does not naturally open to disperse the seeds like the capsule; that office being performed by birds and other animals.

BACCÆ Ornithologus, in the Materia Medica, the name of the fruit or berries of the faphlidus, or fap-ferry-tree. BACCALÆ, in Ancient Geography, a town of Asia, in Syria, leant on a plain between the mountains and the river Orontis.

BACCALAN, in Geography, a small island in the Red sea, on the coast of Arabia Felix, about 36 geographical miles N.W. of Loheia. It is inhabited by fishermen, and has no water in summer, which is then brought from Foostel.

BACCALLARIA, in Middle Age Writers, denotes a kind of country farms, consisting of several manors. Du Cange.

Bacallaria Dominiciana, or Indomincata, was more particularly used for a farm belonging to the lord, and kept in his own hands.

BACCANELUS, Johannes, in Biography, a native of Rheggio, lived in the early part of the sixteenth century. He was deformed in body, and of a diminutive stature, but these defects were abundantly compensated by the powers of his mind, as Brafilavul's tellies. We have of him the following works, which were much esteemed: "De confusis Medicorum, in curHad morbis," lib 4.; and "De confusis Medicorum in cognoscendis simplicibus Liber," Lut. 1554, Venet. 1555 and 1558, and Lugd. 1572, 12mo. containing a judicious abridgment of the opinions of the early Greek writers, on these subjects. Linden. Rediv. p. 524.

BACCARACH, in Geography, a town of Germany, in the Lower Palatinate, formerly imperial and free, but now subject to the elector palatine, who has contributed to its prosperity by allowing the Calvinists and Lutherians to establish their forms of worship there, under equal privileges with the Roman Catholics; seated on the left bank of the Rhine, at the foot of a mountain called Vortigern. It is famous for its wines; whence it is supposed to have its name corrupted from "Bacchus argy," the altar of Bacchus. Baccarach was so completely pillaged by the troops of Louis XIV. in 1689, that the French commander was obliged, on the night before he left the town, to sleep on straw, which was used next day for burning its eight miles north of Deux Ponts, and Vol. III.

BACCARACH Wine, a name of a particular kind of wine, by some esteemed a kind of Rhenish; but Portzius, who has written expressly on the subject, observes that it differs from all the common Rhenish wine, in colour, odour, and virtue.

BACCARUM, in Entomology, a species of ACGARUS, found on gooseberries, currants, and other fruit-trees. The abdomen is dilated, red, and dusty on the sides. Linn. Fn. Succ.

BACCARUM, a species of CINEX, of a somewhat fulvous colour; margin of the abdomen spotted with brown. De Geer. Cimeling. Inhabits Europe.

BACCHALÆ, in Antiquities, the prieleflies of Bacchus, who celebrated the orgia, or mysteries of that god.

The word was also used for the ivy crowns and garlands worn by the priests of Bacchus, in offering sacrifices to him.

BACCHANALIA, religious feasts in honour of Bacchus, celebrated with much solemnity among the ancients, particularly the Athenians, who even computed their years by them, till the commencement of Olympiads. The bacchanalia are sometimes also called orgia, derived, as some conceive, from the Greek orgè, orgy; on account of the madness and enthusiasm wherewith the people appeared to be possessed at the time of their celebration.

They were held in autumn, and took their rise, according to Herodotus, from Egypt, where they were known under the name of the mysteries of Isis and Osiris; whence, according to Diodorus, they were brought into Greece by Melampus; and they afterwards passed into Italy and Gaul, and were adopted almost throughout the whole Pagan world.

The form and disposition of the solemnity depended, at Athens, on the archon, and was at first exceedingly simple; but, by degrees, it became incumbered with a number of ridiculous ceremonies, and attended with much disfutation and debauchery; infoimch that the Romans, who grew ashamed of them, suppressed them by a senatus-consultum throughout all Italy, A.U.C. 568. B.C. 186. It was a saying of Plato, recorded by Diogenes Laertius, (I. iii. Seg. 59.), that to drink to excess was not allowable, except upon the festival of that god who is the giver of wine.

The women had a great share in the solemnity, which is said to have been instituted on their account; for a great number of them attended Bacchus in his expedition to India, carrying in their hands the thymi, i.e. a little lance, covered with ivy and vine leaves, swinging his victories and triumphs wherever they went; the ceremony was kept up after Bacchus's deification, under the title of Bacchanalia, and the women were installed prieleflies thereof, under that of Bacca or Bacchantes.

These prieleflies, at the time of the feast, ran through the streets, and over the mountains, covered with tiger's skins, their hair dishevelled, their thymi in one hand, and torches in the other, howling and shrieking BACCHUS, BACCHUS, or Tß BACCHUS, or Tß BACCHUS.

Men and women met promiscuously at the feast, all perfectly naked, except only for the vine-leaves and cloths of grapes, which bound their heads and hips; here they danced and jumped tumultuously, and, with strange gesticulations, sung hymns to Bacchus, till, being weary and giddy, they tumbled down.

The licentiousness of these, and of some other festivals, was so well known, that it was the advice of wise men to
BAC

married women to abstain from the feasts of Bacchus, and Ceres, and the mother of the gods. Hence that saying of Arifippus, mentioned by Sextus Empiricus, concerning a chaste woman, "That she will not be corrupted even at the Bacchanals;" intimating the great importance of being virtuous that attended these festivals.

BACCHANALIA, Bacchanalia, is also a name given to pictures, or baison-relievo, whereon the feast is represented, consisting chiefly of dancings, nuditie, and the like. Of these baison-relievo, we have some of eight in the "Monumenti inediti" of Winkelmann. They are also exhibited on a fine vase of agate, preferred in the abbey of St. Denis, in France.

There are antique bacchanals still seen on several ancient friezes. The bacchanals painted by Poulin are excellent.

In the Julianian garden at Rome, there is a marble vase of most precious workmanship, upon which is a representation of these orgies of Bacchus. The vase, from the beauty of its sculpture, is supposed to be by the hand of Saurus. The whole pomp of one of these processions is there admirably represented; in which are introduced Bacchus, the Bacchanals, the Menedes, the players on flutes, matrons and virgins, with the cresulum or cymbalum, and tympanum; fawns and satyrs, holding in their hands vases and cups; priests leading the victors defined for sacrifice, such as the boar, the he-goat, and the bull; and, lastly, old Silenus, drunk, upon his ass, which he is hardly able to guide. Burney's Hill Msul. vol. i. p. 320.

Some writers call the Comeliia Carnavat, the Christian Bacchanalia.

Species. 1. B. foelschii, Peruvian ploughman's spikenard. 2. Eupatorium Africanum, &c. Pluck. Phyt. 1. 328. f. 2. Leaves lanceolate, longitudinally tooth-ferrate. Five or six feet high. The female florets with a triad corolla are very abundant. The hermaphrodites at the dikes are few and five-cleft; scales of the calyx in a state of maturity spread very much; florets of the dike barren, of the ray fertile, fimbulate, scarcely toothed; recept. conical. A native of America. Cultivated at the Chelsea garden in 1696. 2. B. aurifolius, oleana-leaved ploughman's spikenard. "Leaves lanceolate, ferrate at the upper part with one or two toothlets. This rife, with a loft shrubby thallus, to the height of eight or ten feet. Flowers of an herbaceous colour, produced in spikes at the extremities of the branches. 3. B. arboresa. "Leaves elliptic-lanceolate, quite entire, naked, petiolate. "About three feet high, with a trunk the thickness of the human arm. Leaves alternate, acute, rough; the terminal corollus panicked. Observed in woods on the island of Johanna, by Koenig.

4. B. balmi-folius, sea-purpurea-leaved ploughman's spikenard, or ground-lilac tree. "Leaves obovate, emarginate-crenate in the upper part." Stems shrubby, six feet high; leaves many, like those of goose-foot, but stiffer, irregularly placed on the branches; flowers crowded, naked, at the ends of the twigs, not handsome, so that it is rather for the foliage of the plant, which continues green throughout the year, that it is usually cultivated. A native of North America. Cultivated by bishop Compton in 1688. 5. B. Distichus. "Leaves broad, lanceolate, toothed, sessile, ruffled." A shrubby, six feet high; leaves alternate, half stem-clasping, deeply indented at the base, soft; panicles small, calyx shorter than the flower. It is wrongly named Baccharis of Diocorides, see Supp. Plant. 567. A native of Egypt. 6. B. irredens. "Leaves ovate, toothed, petiolate." Leaves smooth; branches with railed breaks; corystis large, terminating; peduncles angular, with subulate branches; calyces cylindric, smooth. A native of Ceylon, and the cape of Good Hope. 7. B. brachyspis. "Leaves obovate, entire, feebrous, sessile, veined underneath." Stem somewhat angular; leaves obtuse, almost quite entire; panicles nearly naked, with remote alternate flowers; down ferruginous. It differs from the index in having four, feebly and scarcely toothed leaves, and its flowers larger, fewer, and more remote. A native of Brasil. 8. B. foetida. "Leaves lanceolate, ferrate-toothed, corystis leafy." Six or seven feet high; leaves long, hoary on the under side, of a disagreeable smell when handled; corystis terminal. A native of North America. Cultivated here in 1729. 9. B. chinenlts. Lour. Coeh. 494. "Leaves lanceolate, quite entire, tomentose beneath, hialked; peduncles many-flowered, axillary." An under-shrub, three feet high, effec, simple, round; leaves alternate, flanged; flowers yellow, oblong. A native of China, near Canton.

Propagation and Culture. Species 1. may be propagated by cuttings, planted in a flabby border, during any of the summer months; or by seeds sown on a common border in the spring. If planted in a warm situation, it will live in mild winters in the open air; but it is usually kept in the green-house, and placed out in summer. It requires much water in warm weather. The second species is difficult to propagate, for the cuttings will seldom take root, and it rarely has shoots near the ground to lay down, so that in Holland they lay down the entire head of young plants, flitting the smaller branches, in the same manner as is practised for carnations, laying them into the ground, and farking each down to prevent their rising: the, when duly watered, will put out roots in one year, when they may be taken off, and planted in small pots filled with light earth, and placed in the flade till they have taken new root. In summer they ought to be kept in a sheltered situation, and in the green-house in winter. The fourth species may be propagated by cuttings planted in April or May, in a flabby border, and if properly watered they will be fit for transplanting in the places where they are to remain at Michaelmas. The eighth species may be also propagated by cuttings, which in about two months take root, when they are to be potted and kept under a frame during the winter. The others are more tender and require the protection of a stove, but are little known in this country. See Martyn's Miller's Diet.

Baccharis. See Athanasia, Chrysocoma, Conyza.

Baccharis was also the name of a sweet ointment among the ancients, so called perhaps from this herb's being a principal ingredient in it.

BACCHAROIDES. See Conyza.

BACCHI, in Mechanica, a kind of ancient machines, in form of goads, used by Jupiter in his wars against the giants. Rudbeck.
BACCHUS

Rudbeck describes two kinds of bacchi, one made like the battering-ram, wherewith Jupiter demolished the enemies' fortifications; the other contrived to call fire out of, from which the Greeks are conjectured to have framed their idea of chimera.

BACCHIAS, and ANTIBACCHIAS, in Ancient Geography, the name of two islands in the Arabian gulf, according to Pliny. They are called by Ptolemy and Stephanus, Bacchi and Antibacchi insula.

BACCHIC, something relating to the ceremonies of Bacchus. The celebrated intaglio, called Michael Angelo's ring, is a representation of a bacchic seal.

BACCHUS, in Music, is sometimes used for a chant à boire, or composition to inspire jollity. But, in a more proper sense, it is redefined to a dithyrambic ode, or hymn.

BACCHICA, in Botany, is a term used for helix, or ivy.

BACCHIGLIONE, in Geography, a river of Italy, in the flate of Venice, which, after watering Vicenza and Padua, discharges itself into the gulf of Venice, near Chioggia.

BACCHINI, Benedict, in Biography, a learned monk, was born at Borgo San Donino, in the duchy of Parma, in the year 1651. At the age of sixteen he entered into the order of St. Benedict, in the monastery of Mount Caffin, and applied to his studies so intently as to injure his health. After having travelled with Arcioni, abbot of the Benedicines at Ferrara, to whom he was secretary, he resigned his office, and settled at Parma. Here he published a literary journal, manifesting great learning and judgment; but it excited against him many enemies, who prevailed with the duke of Parma to banish him from his territory. Bacchini then retired to Modena, where he was patronized by the duke of Modena, and appointed his historiographer and librarian. The materials which he collected for investigating the genealogy and history of the house of Este, were transferred to his successor Maratori, upon his removal to the abbacy of the Benedicines of Modena. In 1705, he founded at Modena an academy of ecclesiastical literature. His last preoccupation was that of professor of ecclesiastical history in the university of Bologna, where he died, at the age of seventy, in the year 1721. Bacchini was one of the most celebrated scholars of his age, distinguished by his universal learning, refined taste, theological skill, and ecclesiastical philology; to all which he added in early life eloquence as a preacher; and in more mature years critical acumen, and eminent skill in deciphering manuscripts. Besides his literary journal, commenced at Parma in 1668, and continued to 1695, resumed at Modena from 1692 to 1697, and extant in nine volumes 4to. 1 wrote in Italian the History of the Benedicines Monastery of Polignoi, and in Latin, De Silvorum Figuris ac Differentiis, 4to. Bonomie, 1691, and reprinted at Utrecht, 1696, with notes by Tollius; De Ecclesiastice Hierarchie Originibus, 4to. Modena, 1703; and some other small pieces. Nouv. Dict. Histoire. Gen. Bioi.

BACCINUS, in Ancient Geography, a town of Egypt, near the lake Marris. Ptolemy.

BACCIUM, an island of the Ægean sea, opposite to Phocaea, at the entrance of the gulf of Smyrna. The temples and flats, with which it was richly adorned, were ransacked by the Romans.

BACCHIUS, in the Latin Poetry, a kind of foot, consisting of three syllables; whereof the first is short, and the two latter long; as ēgūsā.

The bacchius is the reverse of a dactyl, and takes its name from that of Bacchus, because frequently used in the hymns composed in his honour. It was also called among the ancients, ἀνθρῖς, τριπαθίς, ἔλλος; and by the Greeks, ἀνθρῖς.

BACCHIIUS SENIOR, in Biography, one of the seven Greek writers, who, like Ptolemy, allowed of no more than seven modes. See Modes. On the subject of rhythm, he quotes Arisfoenus, Nicomachus, Leophantus, and Didymus; so that it is certain he wrote subfrequent to all those authors.

BACCHIUS, in Entomology, a large species of Scarabæus, that inhabits the Cape of Good Hope. The shield of the head is four-toothed; thorax gibbous, and with the wing-cases gibbrous. Fabricius.

BACCHUS, a species of Curculio that inhabits Europe. It is coppery, with the snout and ends of the feet black. Fabricius, &c.

BACCHUS, a species of Monoculus, with an orbicular shell; antennæ extended horizontally; tail denticulated on each side. Müller entomol. Inhabits rivers.

BACCHUS in Mythology, a name synonymous among the Phoenicians with "mourning," and supposed to be derived from the Phoenician term bakal, to weep, and given to several deities, or rather to the same god, acknowledged under various distinct epithets and characters in the different countries where he was worshipped. In Egypt, he was called Osiris; in Arabia, Adamus; in Mylba, Phanazer; in India, Dionysus, or Dionysius; by the Lucanians, Penusus; throughout the Roman dominions, Liber, &c. &c. The reasons assigned for these different appellations, by which the same god was distinguished, are listed by Banier in the second volume of his "Mythology." It is natural to suppose that the Greeks and Romans, in their usual manner, bestowed upon the one Bacchus whom they worshipped, the several actions and attributes of the many divinities known by that name, and by other equivalent denominations in different countries. Cicero (de Nat. Deor. iii. 23.) mentions five divinities known by the name of Bacchus, and thus adds two to the three of Diodorus Siculus and Philostratus Antiquity, however, has chiefly distinguished two gods, under the title of Bacchus; that of Egypt, the son of Ammon, and the name with Osiris; and that of the Greeks, or of Thebes in Bocotia, the son of Jupiter and Semelé. The Bacchus of Egypt was the Dionysus of the Hindus, so called from the city of Nysa in Arabia Felix, where he was brought up, and worshipped by them in consequence of the glory he had acquired by leading his army into India. (See Dionysus.) According to Sir Isaac Newton (Chron. apud Op. vol. p. 77-80.), this great Bacchus, whom the Arabs did denominate from a word which in their language signified "great," was the same with Sesac or Sesostris, who became king of Egypt in the reign of Solomon. (1 Kings xi. 40.) See Sesac, and Sesostris.

All agree (says this author) that Bacchus was the fame king of Egypt with Osiris (see Osiris); and he supposes that the Osiris, or Uranus, or Jupiter Uranus of the Arabians, the other god besides Dionysus whom they worshipped, was the same king of Egypt with Ammon, the father of Bacchus, according to the poet:

"Quamvis
"Quamvis Ethiopum populis, Arabumque bestia
Gratibus, utique Indis unus fit Jupiter Ammon."
(See Amm. Sir Isaac Newton adds, that when Ariadne, the daughter of Minos, was defeated by Theseus in the island Naxos or Dia, and taken up by Chaucus, an Egyptian commander at sea, she became the mistress of the great Bacchus, who was at that time returning from India in triumph; and by him she had two sons, Phyllas and Eunomus, who were Argonauts. This Bacchus was caught in bed by Phrygia with Venus, the mother of Zneas, according to Homer (Od. cl. viii. v. 202), just before he came over the Hellepont and invaded Thrace; and he married Ariadne, the daughter of Minos, according to Heliod (Theb. c. v. 947); and therefore, by the testimony of both Homer and Heliod, who wrote before the Greeks and Egyptians corrupted their antiquities, this Bacchus was one generation older than the Argonauts; and he being king of Egypt at the same time with Sesostris, they must be one and the same king. They also agree in their actions: Bacchus invaded India and Greece; and after he was routed by the army of Perseus, and the war was compos'd, the Greeks did him great honours, and built a temple to him at Argos, and called it the temple of the Ctesian Bacchus, because, as Paufanias relates (l. 2. c. 23.), Ariadne was buried in it.

The distinctive character of this Indian Bacchus was a long beard, whence he was denominated "the bearded Bacchus," or Καίαρειος. Some have supposed that there was another Bacchus peculiar to Egypt, and the most ancient of all; and, indeed, Diodorus Siculus seems to warrant this opinion, by mentioning three different deities under this appellation. Accordingly, Bochart (Geog. Sac. l. i. c. 18. apud Oper. t. i. col. 439, &c.) conjectures, that Bacchus was the same with Nimrod, the father of Ninus; and he supposes that the worship of this deity originated in Assyria, and from thence was transmitted to the Syrians and Phenicians; and that it was communicated by the Phœcians to the Greeks. Many of his names, attributes, and actions bear an obvious allusion to the scripture history, and are most satisfactorily elucidated by it. Amongst those who have referred the origin of Bacchus, and the worship that was performed in honour of him, to the earliest antiquity, and very nearly to the derivation at Babel, we may mention the learned Mr. Bryant, who discourses in the history of the exploits of this illustrious person, references to the migrations of the Cuthite colonies, or of the sons of Chus, who, upon their departure, betook themselves eastward to the Indus and Ganges, and finally passed into Egypt. See Cuthites, and Dispersion.

The Theban Bacchus, or Grecian Bacchus, is particularly distinguished by Diodorus Siculus, l. iii. This historian informs us, that Orpheus first deified the son of Semele, by the name of Bacchus, and that he appointed his ceremonies in Greece, in order to render the family of Cadmus, the grandfather of the Grecian Bacchus, illustrious. Semele, it is said, was struck with lightning at the very instant of her son's birth; and the child was probably denominated Bacchus, from the grief which this melancholy accident might have occasioned in the family. Cadmus, with a view of concealing his daughter's dishonour, conveyed away his infant grandson, as it should seem, to some of his relations in Phœnicia or Egypt. After having been there instructed in the mysteries of Isis and Osiris, and initiated in all the magical or juggling tricks of the Egyptian priests and hierophants, and having attained the maturity of age, he returned to Thebes with the traditional retinue of the original deity of the same name, and claimed divine honours; which, after some opposition, were allowed him. To this Grecian Bacchus the actions of Osiris were ascribed, together with a variety of absurd and disgraceful adventures in which his prototype had no concern. Hence the Theban Bacchus became a monstrosity of licentiousness and debauchery; whereas the Egyptian was of a very contrary character. Of course the mysteries of the former were attended with the most shocking abominations. See Bacchus, Dispersion.

According to the account of Diodorus Siculus (l. iii. p. 275.) there was no nation upon earth, neither Grecian nor foreign, that was not indebted to this deity for some mark of his munificence and favour. He taught the people to plant the vine, and to preserve the juice of the grape, and to lay up the fruits of the earth in proper repositories. Those who partook of his labors and ungenial soil, not adapted to the cultivation of the vine, were shown the art of making a drink from barley, not less grateful than that which proceeded from the grape. He adds (l. iv. p. 210), that the person, from whom these blessings were derived, is represented of the highest antiquity, and the greatest benefactor ever known by mankind. Such is also the history given of Osiris, under which character, says Bryant (Anc. Myth. vol. iii. p. 445), we are to understand a people who went forth and performed all that has been mentioned. Their religion conflicted in the worship of the sun under various titles; accordingly however Dionysus or Bacchus may be diversified by various names or titles, all of them, as this learned writer imagines, with regard to worship, relate ultimately to the sun. Such was also the opinion of Selden (De Dis Syris, p. 77.) 'To this worship were added, by the ancient people to whom Bryant refers, divine honours paid to their ancestors, the Baalim of the first ages: all which were attended with particular mystical rites, in which were commemorated the circumstances of the deluge, and the history of the great patriarch by whom mankind was preferred. Bacchus was esteemed one of the founders of medicine.

Diodorus Siculus further informs us, that it was Bacchus, the son of Semele, who invented fairs and theatres, and who first established a music school, exempting from all military functions such musicians as discovered great abilities in their art; on which account, says the same author, musicians formed into companies have since frequently enjoyed great privileges.

Dr. Burney (Hist. Music, vol. i. p. 298.) observes, that the dithyrambs, which gave birth to dramatic representations, are as ancient as the worship of Bacchus in Greece; and there is little doubt, but that the ceremonies of his mysteries gave rise to the pompe and illusions of the theatre. Many of the most splendid exhibitions upon the stage for the entertainment of the people at Athens and Rome being performed upon the festivals of Bacchus, gave occasion to the calling all those that were employed in them, whether for singing, dancing, or reciting, "servants of Bacchus," Paufanias, in his Attics (p. 7. ed. Kuhnii), speaks of a place at Athens consecrated to Bacchus the singers; thus named, he says, for the same reason as Apollo is called the chief and conductor of the Muses. Whence it should seem, says Burney (ubi supra), that "Bacchus was regarded by the Athenians not only as the god of wine, but of song; and it must be owned, that his followers, in their cups, have been much inclined to singing ever since. Indeed we are certain, that in none of the orgies, processions, triumphs, and festivals, instituted by the ancients to the honour and memory of this prince of the vineyard, music was forgotten, as may be still gathered from ancient sculpture, where we find not only that musicians, male and female, reigned him with the lyre,
lyre, the flute, and with song; but that he was accompanied by fawns and futes playing upon timbrels, cymbals, bagpipes, and horns; these Suidas calls his mindfrefs; and Strobo gives them the appellations of Bacchi, Sikeli, Salyi, Baccus, Linos, Thyrs, Mamillones, Naiades, Nymphs, and Thymi. These representations have furnished subjefts for the finest remains of ancient sculpture; and the most voluptuous passages of ancient poetry are defcriptions of the orgies and festivals of Bacchus.

Nonnus, an Egyptian of Pentapolis, who lived in the fifth century, has collected all the fabulous adventures of Bacchus, and exhibited them in a beautiful, but irregular, poem, under the title of "Dionysiacs." See Dionysiacs, and Nonnus.

The Grecian Bacchus, the god of wine and fong, is usually represented under the figure of a jolly bearded youth, crowned with ivy (that plant, as it is faid, being reputed an antidote to the intoxicating effects of wine), and also vine-leaves: bearing in one hand a spear or thyrsus, wrapped with the fame, and in the other, grapes, a cup or a horn for drinking; and drawn on a car by tigers and panthers. He is sometimes exhibited with a mitre on the head, or a kind of band or fillet raised in front, and falling back over the shoulders, and with his temples ornamented by horns. These horns originated from the relation he fupported to the fun, whose rays were thus reprehended. On the Greek medals, Bacchus is known by his crown of ivy or vine, his diadem and horn, with a tiger and futes around him.

Bacchus, in Experimental Philosophy, is the name of a small brass apparatus (Pneumatics, Pl. IX. fig. 73.) feated on a culf, with a tube proceeding from the mouth to the barrel; this is filled with red wine, or coloured water, fo that being put under a receiver, when the air is exhaufted, the liquor is thrown up into his mouth, by the expansion of confined air, and the rofy god fems to be at his usual employment; while he is drinking, his belly expands, which is effected by a bladder, containing a small quantity of air, concealed under his shirt.

Bacchylides, in Biography, a celebrated Greek lyric poet, the nephew of Simonides, was a native of the island of Cees, and flourished in the 82d olympiad, B.C. 425. He is reckoned the laft of the nine lyric poets of ancient Greece. The purity of his style, the correctness of his manner, and the regular and connected beauties of his work (See Longin. de Sublim. c. 33.), obtained for him an applause of which Pindar might have been jealous. These two poets divided, for some time, the favour of king Hiero, and the fatisfactions of his courtiers; but when the royal patronage no longer prevented each from taking his true place, Pindar foared to the skies, and Bacchylides remained on earth. The compositions of Bacchylides confifted of hymns, odes, and epigrams, which abounded in moral sentiment; fo that the emperor Julian, according to Ammianus Marcellinus, was fo much delighted with them, that he was frequently accustomed to repeat his verses. Horace is faid sometimes to have imitated him in some of his pieces, particularly in the prophecy of Nerus, which was fuggelied by the Greek poet's veneration of Caffander. Some fragments only of Bacchylides now remain. Anacharsis, vol. vi. p. 342.

Bacchylus, a Christian divine, was bishop of Corinth in the second century. He is mentioned by Eusebius, with Polyenae bishop of Antioch, and others, who had left testimonials of the orthodoxy of their faith in writing. He afterwards speaks of a letter written by Bacchylus about the time of celebrating Easter. Jerom, in his Catalogue, says, that Bacchylus, bishop of Corinth, who flourished in the time of the emperor Severus, wrote an elegant book about Easter, in the name of all the bishops of Achaea. His works are lost. Eufeb. H. E. l. v. c. 22, 23. p. 192. Hieron. de Vir. Illustr. c. 44. Lardner's Works, vol. ii. p. 305.

Bacciferous Plants, in Botany, are fuch as bear berries, i.e. fruit, covered with a thin membrane, wherein is contained a pulp, which grows soft and moift when ripe, and infletes the feed within its fubftance. The bacciferous trees Mr. Ray divides into four kinds: 1. Such as bear a calculate, or naked berry, the flower and calyx both falling off together, and leaving the berry bare, as the fall-fras tree, &c. 2. Such as have a naked monoporous fruit, that is, containing in it only one feed; as the arbatus, the cerchurus, lentificus, &c. 3. Such as have a naked, but a polyporous fruit, that is, containing two or more kernels or feeds within it, as the jafinum, ligurium, &c. 4. Such as have their fruit composed of many allices or round foft balls, fet close together, like a bunch of grapes; as the aca marina, the rubus vulgaris, rubus Idæus, and the rubus minor fructu ceurolo.

Bacchinium, or Baccina, in Antiquity, a bafoon or vessel to hold water to wash the hands. The holding the bafoon, or waiting at the bafoon, on the day of the king's coronation, was an ancient tenure in ferjeantry. Lib. Rub. Senecc. f. 137.

Baccici, or Bacci, in Biography. See Gaull.

Baccio, Fra. Bartolomeo, called Bartoloni di S. Marco, a painter of history and portrait, was born at Savignoise, near Florence, in 1490, and became a disciple of Cosimo Rotelli; but derived his principal knowledge in the art of painting from Leonardo da Vinci. He understood the true principles of design better than most masters of his time, and was also a considerable painter in perspective; so that he directed the studies of Raphael with regard to the art of managing and uniting colours, as well as the rules of perspective. Some years after Raphael left Florence, Baccio visited Rome; and by the observations he made on the antiques, and the works of Raphael, he made great improvement, which was manifested in his picture of St. Sebastian. This picture, which he finished after his return to Florence, was so well designed, so naturally and beautifully coloured, and had also such an expression of pain and agony, that it was removed from public view in the chapel of the convent, because it made too strong an impression on the imaginations of many women who beheld it. He was very laborious, and studied nature; he designated the naked correctly; his figures had much grace, and his colorings admirable. To him is ascribed the first invention of the machine called by the artificts a layman, and at this day generally used. Upon this he placed his draperies, for the purpose of more accurately observing their natural and their more elegant folds. A capital picture of the Assumption by Baccio is in the Florentine Collection. He died in 1517. Parkington.

Baccius, Andrew, a native of Ancona, practised medicine at Rome, towards the end of the 16th century. He was physician to Cardinal Aeciano Columna, and afterwards pope Sixtus the fifth. A man of indefatigable industry, and of great genius and learning, as his numerous publications testify. The principal of them "De Thermis, Lacubus, Fluminibus, et Balneis totius Orbis," lib. viii. was first printed at Venice, 1571; again 1588; then at Rome, 1622; at Padua, 1711, folio. The last edition is augmented with an eighth book, containing analyses of the different mineral waters, with observations extracted from other writers on the subject. We have also of this author, treatises, "De Venenis, et de Antidotis," 4to. Rome, 1586; "De Dignitate

BACCOFOE, in Bontany, the name of a fruit very common in Guinea. It is like the banana, except that it is whiter, thicker, and flunter. The taste and smell are both very agreeable, and some pretend, that on cutting it through transfervely, there is the figure of a crucifix on each side of it. Phil. Trans. No. 1608.

BACH, Sebastian, in Biography. The illustrious family of Bach has produced more great musicians, than any other single family in Germany, or, perhaps, in Europe; as previous to the great eminence to which Sebastian had arrived, early in the last century, his family, according to Walther, had distinguished itself in the profession of music, particularly in organ-playing, for four generations. Innumerable are the stories full circulating in Germany, of Sebastian Bach’s conduct and triumphs over his great competitors, till at length, like a courtier often victorious, his form was so high, as to discourage all competition. He was as superior to all organ-players on the continent, as Handel was in England.

The performances and compositions of these two great musicians, not only surpassed those of all their contemporaries, but established a style of playing and writing for the organ, which is still respected and imitated by the greatest organists in Germany, where men of superior abilities have always abounded, and been celebrated, not only for treating the manuals, but the pedals of that noble instrument.

Sebastian Bach is said by Marpurg, in his "Art de la Tugue," to have been "very great musician in one, profound in science, fertile in fancy, and in taste easy and natural;" he should rather have said, original and refined, for to the epithets easy and natural many are unwilling to assent; as this truly great man feems by his works for the organ, to have been constantly in search of what was new and difficult, without the least attention to nature and facility.

Old Kirman, the harpsichord maker, used to relate the extraordinary curiosity excited at Salzburg, when Handel and Sebastian Bach happened to meet in that city. On their going together to the cathedral, they found it so full that they could scarcely get to the organ-loft; and when one of them opened the organ, it was not possible for more persons to crowd into the church. But so great was the fame of these performers, that those who could not gain admission into the interior of the building, procured ladders, and placed them at the windows, in order to gratify their ears with all the passages which the full organ could convey to them through all impediments.

Of Sebastian Bach, who was successively cantor, organist, and music director, at Leipzig, all the musical writers of Germany for these last forty years, have born testimony to the abilities. Quantz in his "Art of Playing the Flute," written during the life of Bach, says, that this admirable musician had brought organ playing to the highest degree of perfection.

The challenge which he received and accepted, from the celebrated French organist Marchand, at Dresden, is well known in Germany. Upon the arrival of Marchand in that city, after he had vanquished all the organists of France and Italy, he offered to play extempore with any German whom the king of Poland could prevail upon to enter the lists against him; no one at Dresden had the courage to encounter so successful a champion; but an express being sent to

Sebastian Bach, who was at that time a young man, and residing at Weimar, he came away immediately, and, like another David, vanquished this Goliath. It must not, however, be concluded from this defeat, that Marchand was a mean performer; if that had been the case, the victory over him would have added nothing to the fame of his competitor. It was an honour to Pompey that he was conquered by Caesar, and to Marchand to be only vanquished by Bach.

This was the Bach whom the learned editor of the Latin Theatrustus, John Matthias Gessuer, has celebrated in his notes on Quintilian, i. xii. p. 61, where the ancient citharists are extolled for the use they made of their feet as well as their hands (perhaps merely to beat time) in their performance. The critic addressing himself to the flade of Quintilian, exclaims; "you would think but slight, my dear Fabius, of all those exertions of the citharists, if you could rivitate the world, and attend the exhibitions of Bach, one of my colleagues in the university of Leipzig; who, when at the great organ, while every finger of both hands is engaged at the manuals, his feet are running over the pedals with a skill and velocity which several of your citharists with 500 tibiae could not emulate; nor is his destiny inferior in directing a band of thirty or forty performer, all employed at once; correcting the time of one by his nod, of another by his foot, and of a third by holding up a threatening finger; giving the right note to one from the top of his voice, to another from the bottom, and to a third from the middle of it; if you could have seen him amid the very powerful sounds with which he was surrounded, performing a very difficult part himself, yet marking whence proceeded the least discordance, and aiming those that erred; favourer as I am of antiquity, the exertions of our Bach appear to me to effect what not many Orpheuses, nor twenty Ariods, could achieve. "Maximus aequo antiquitatis fanus, multos unam Orpeus et viginti Arionas complexum Bachiuminem et quis illi similis sit forte, arbitrator." Sebastian Bach died at Leipzig in 1754.

BACH, Charles Philip Emanuel, son of Sebastian, refided many years at Berlin, in the service of Frederic II. king of Prufia; he was afterwards music-director at Hamburg, and long regarded as the greatest composer and performer on keyed instruments of his time; he was certainly the founder of the present style of composition for the piano-forte, as his father and Handel had been for that of the organ. It was observed by Abel, that if Sebastian Bach and his admirable son Emanuel, instead of being music-directors in commercial cities, had been fortunately employed to compose for the stage and public of great capitals, such as Naples, Paris, or London, and for performers of the first class, they would doubtless have simplified their style more to the level of their judges; the one would have sacrificed all unmeaning art and contrivance, and the other have been left fantastical and recherche, and both, by writing in a style more popular, and generally intelligible and pleasing, would have extended their fame, and been indistinguishably the greatest musicians of the eighteenth century.

Emanuel Bach, in his life, written at our request by himself, has some excellent reflections on his own style, which he formed and polished by hearing the greatest performers, vocal and instrumental, of his youth, who visited his father, or were employed in the theatre at Berlin. When the critics, says he, are disposed to judge impartially, which seldom happens, they are frequently too severe on works that come under their lash, from not knowing the circumstances that gave them birth, or remembering
ing the author’s original intention. But how seldom are critics found to poise their feeling, science, probity, and courage; qualities without which no one should set up for a sovereign judge. It is a melancholy truth, that musical criticism, which ought to be useful to the art, is in Germany a trade, commonly carried on by dry, malignant, and stupid writers. He then declares that of all his works, those for the clavichord or piano-forte are the chief in which he has indulged his own feelings and ideas. His principal work has been to play and compose in the most vocal manner possible, notwithstanding the great defect of all keyed instruments, except the organ, in not fulfilling their tone. But to make a harpsichord or piano-forte sing, is not easily accomplished; as the ear must not be tired by too thin a harmony, nor dinned by too full an accompaniment. In his opinion, music ought to touch the heart, and he never found that this could be effected by running, rattling, drumming, or arpeggios.

If Haydn ever looked up to any great master as a model, it seems to have been C. P. Em. Bach : the bold modulation, refts, pauses, and free use of semitones, and unexpected flights of Haydn, remind us frequently of Bach’s early works more than of any other composer. But in writing for violins, he has surpassed his model in facility and invention; freaks, whims, and even buffoonery, appear natural to Haydn, which in the works of his imitators seem downright caprice and affectation. Em. Bach used to be centred for his extraneous modulation, crudities, and difficulties; but, like the hard words of Dr. Johnson, to which the public by degrees became reconciled, every German composer takes the fame liberties now as Bach, and English writer uses Johnson’s language with impunity. Emanuel Bach died at Hamburg, 1788, at near eighty years of age.

Bach, John Christian, arrived in England 1763, during the opera regency of the admirable female finger and mistress, Colomba Mattei, who had engaged him as composer of the serious opera. He was the youngest son of Sebastian Bach, and had been a confident student in Italy, where he added new lustre to his name and family by his dramatic productions, and had been appointed by the empress queen organist of the Duomo at Milan.

On his arrival here, he was extremely mortified to find that he had no better fingers to write for than Ciardiini and the Cremonini, two performers hardly worthy to be ranked in the second class; and for some time he totally declined composes for our stage, being unwilling as a stranger, to trust his reputation to such performers. But, at length, having heard the De Amicis sing two or three serious songs in private, it suggested to him the idea of giving her the first woman’s part in his serious opera and having communicated his design to Mattei the impresario, matters were soon arranged, and the De Amicis, who afterwards held the first rank among female fingers in the serious operas of Naples and other great cities of Italy, was now first taken from the comic opera, and invested with the character of principal woman in the serious. And during the rest of the season, on Tuesday nights, the delighted the town as the representative of Thalia, and on Saturdays as that of Molpomene.

John Christian Bach’s first opera in England, called Orion, or the Diana Vendicata, was honoured with the preference of their Majesties on the first night, February the 17th, 1763, and extremely applauded by a very numerous audience. Every judge of music perceived the eminence of genius throughout the whole performance; but were chiefly struck with the richness of the harmony, the ingenious texture of the parts, and above all with the new and happy use he had made of wind-instruments; this being the first time that clarinets had obtained admission in our opera orchestra. Their Majesties honoured the second representation likewise with their presence, and no other serious opera was wanting for near three months. Zanarda, however, a first serious opera by this composer, was brought out in May, which ran more than a month, when the season closed.

The principal songs of these two operas, though excellent, being calculated to display the compass of voice and delicate and difficult expression and execution of De Amicis, were not likely to become common or of much use out of the opera house. The bulk of the airs were so indifferently sung, that they were more admired as instrumental pieces, than compositions for the voice. But this excellent matter soon convinced us that he polished every requisite for a great musician, by the songs he afterwards composed in every style of good singing; by his symphonies, quartets, and concertos for almost every species of instrument, as well as by his expressive and masterly performance on the piano-forte. It is with pleasure that we take this opportunity of doing justice to the talents and abilities of a man who improved our taste both in composition and performance. Having very early in life been deprived of the instructions of his father, the great Sebastian Bach, he was for some time a scholar of his elder brother, the celebrated Charles Phil. Emanuel Bach, under whom he became a fine performer on keyed-instruments; but on quitting him and going to Italy, where his chief study was the composition of vocal music, he affixed, that during many years he made little use of a harpsichord or piano forte but to compose for or accompany a voice. When he arrived in England, his style of playing was so much admired that he recovered many of the lost his hand had futilized by disease, and by being continually cramped and crippled with a pen; but he never was able to reinstate it with force and readiness sufficient for great difficulties; and in general his compositions for the piano-forte are such as ladies can execute with little trouble; and the allegros rather resemble bravura songs than instrumental pieces for the display of great execution. On which account, they lose much of their effect when played without the accompaniments, which are admirable, and to masterly and interesting to an audience, that want of hand, or complication in the harpsichord part is never discovered.

There are many admirable airs in the operas he composed for our stage that have remained in fashion. The rich effects of the accompaniments perhaps deserve more praise than the originality of the melodies; which, however, are always natural, elegant, and in the best taste of Italy at the time he came over. The Neapolitan school where he studied, is manifest in his cantilenas, and the science of his father and brother in his harmony. The operas of this master are the first in which Da Capos disappeared, and which, about this time, began to be generally discontinued: the second part being incorporated with the first, to which, after modulating into the fifth of the key, the finger generally returns.

Bach seems to have been the first composer who observed the law of contrapunt, as a principle. Before his time, contrat there frequently was, in the works of others; but it seems to have been accidental. Bach in his symphonies and other instrumental pieces, as well as his songs, seldom failed, after a rapid and noisy passage, to introduce one that was slow and soothing. His symphonies seem infinitely more original than either his songs or harpsichord pieces, of which the harmony, mixture of wind-instruments, and general richness and variety of accompaniment, are certainly the most
most prominent features. In the sonatas and concertos which he composed for his own playing, when his hand was feeble, or likely to tire, he diverted the attention of the audience to some other instrument; and he had Abel, Fischer, Cramer, Croftari, Cervetto, and other excellent musicians to write for, and take his part, whenever he wanted support.

In 1765, he new set Metallello's Adriano in Siria, in the performance of which the rich, powerful, and melodious voice of Manzoli was assigned the principal part. The expectations of the public the first night this drama was performed, occasioned such a crowd at the King's theatre as had been seldom seen there before. It was impossible for a third part of the company collected together on this occasion to obtain places. But whether from heat or inconvenience, the unreasonable stays of expectation, the composer being out of fancy, or too anxious to please, the opera failed. Every one seemed to come out of the theatre disappointed, and the drama was performed but two or three times. This seemed matter of great triumph to the Italians, who began to be jealous of the Germanic body of musicians at this time in the kingdom. The songs were printed by the elder Welcker, and many of them sung afterwards at concerts with great applause, and found, as detached airs, excellent, though they had been unfortunate in their totality.

Soon after his arrival in England, J. C. Bach and his countryman Abel uniting interests, opened a subscription for a weekly concert; and as their own compositions were new and excellent, and the best performers of all kinds which our capital could supply enlisted under their banners, this concert was better patronized and longer supported than perhaps any one had ever been in this country; having continued for full twenty years with uninterrupted prosperity. Bach had not been long in London before he had the honour of being appointed chamber-musician and musfe- matter to her majesty; and his merit seems to have been constantly well understood and royally patronized at St. James's to the end of his life, which he terminated, after a short illness, in 1782. And having much more genius than worldly prudence, he left his widow Mrs. Bach (formerly the signora Graff, first woman at the opera during the run of Gluck's Orfeo) in very indigent circumstances; but her majesty finding that she wished to return to her own country, settled a pension upon her to enable her to end her days there in ease and comfort.

BACH, in Geography. See Batha.

BACH, in Ornithology, a species of Falco figured in the fifteenth plate of Le Vaillant's work on the birds of Africa. It is about the size of that kind of falcon which we call the common buzzard; and it naturally belongs to that tribe of rapacious birds. The prevailing colour is a very deep brown, with the lower parts of the body and belly spotted with white, and a large band of the same white colour disposed transversely upon the tail. On the back of the head is a tuft of white feathers, with black tips, that forms a creft; the beck and legs are yellow. The plumage of the female is varied with whitish and yellow.

This is a solitary and ferocious creature; and its chief haunts are the barren mountainous parts of South America. It utters a piercing cry, which as it redounds among the rocks is truly lamentable. The rapidity of this bird in flight is remarkable; and its patience when waiting for its prey is not less deserving mention; it will remain for hours together in one position, and be during that time immovable as to be mistaken for a point of the rock on which it feeds, but the moment a lizard or any other reptile appears on which it feeds, it darts down upon it with the greatest velocity. These birds build their nests in the craggy hollows of the rock; and the female lays two, or at most three, eggs at a time.

BACHASH, in Geography, a small island among the western islands of Scotland, near the north-east coast of North Vift.

BACHELIERI, La, a town of France, in the department of the Dordogne, and chief place of a canton, in the district of Martignac; four leagues north of Sarlat.

BACHELOR, of Batchelor, Baccalaurevs, in Middle Age Writers, was a denomination given to those who had attained to knighthood, but were not rich enough, or had not a sufficient number of vassals, to have their banners carried before them in battle; or, if they were of the order of bannerets, were not yet of age to display their own banner, but obliged to march to war under the banner of another.

Candcn and others define bachelor, a person of a middle degree between a knight and an esquire, of less age and standing than the former, but superior to the latter.

Others will have bachelor to have been a common name for all degrees between a mere gentleman and a baron.—Thus we find the lord admiral, when he was neither an earl nor baron, denominated a bachelor. — "Ant it is to weet, that when the admiral rideth to appeare a shipp of war, or other, for the busines and affairs of the realm, if he be a bachelor, he shall take for his day-wages four shillings a day; if he be an earl or baron, he shall take wages after his estate and degree." BACHELOR was more peculiarly a title given to a young cavalier, who made his first campaign, and received the military girdle accordingly.

BACHELOR was also a denomination given to him who had overcome another in a tournament, the first time he ever engaged.

BACHELORS, KNIGHTS, in Heraldry. See Knights BACHELORS.

BACHELORS is also used in a college senate, to denote a person possessing of the Baccalaurevs, which is the first degree in the liberal arts or sciences.

The degree of bachelor was first introduced in the thirteenth century by pope Gregory IX. But it remains still unknown in Italy. At Oxford, before a person is entitled to the degree of bachelor of arts, he must have studied there four years; three years more to become master of arts; and seven more to commence bachelor of divinity.

At Cambridge, to commence bachelor of arts, he must have been admitted near four years, and above three years more before he commence master; and seven more full to become bachelor of divinity. He may commence bachelor of law after having studied it six years.

At Paris, to pass bachelor in theology, a person must have studied two years in philosophy and three years in theology; and held two acts of examination in the Sorbonne. Bachelors in the canon law are admitted after two years study in the same, and obtaining an act according to the forms. A bachelor of physic must have studied two years in medicine, after having been four years master of arts in the university; and having flown an examination; after which he is invested with the sur, in order to be baccelled.

In the university of Paris, before the foundation of divinity-professorships, those who had studied divinity five years were admitted to go through their course, whence they were called bacalaurevs curfors; and as there were two courses, the first employed in explaining the Bible, during three succedent years; the second, in explaining the matter of the sentences for one year; those who were in their Bible course were
were called bacallarii Bachi; and those arrived at the Cer-
tences, bacallarii fententiarium; and, lastly, those who had
gone through both, were denominated bacallarii formati, or
formal bachelors.

At present, formal bachelor denotes a person who has
taken the degree regularly after the due course of study and
exercises, required by the statutes; by way of opposition to a
curren bachelor, who is admitted in the way of grace, or
by diploma.

We also find mention of bachelors of the church, bacca-
larii ecclesea.-The bishop with his canons and bacallarii,
cum confitei & confessos omnium canonicorum suorum & bacca-
larium.

There is scarce any word whose origin is more contro-
verted among the critics than that of baccerus, bacallarius, or
bacallarius: the two different acceptations of the word
literary and military, above recited, have each of them their
advocates, who affect each to be the primitive sense, and
derive the word accordingly.

Among those who hold the military bachelor to be the
more ancient, is Cujas, who derives the word from bacel-
larius, a kind of cavalry, anciently in great esteem. Du-
Cange deduces it from bacallarius, a kind of fees, or
farms, consisting of several pieces of ground, each where-
boed contained twelve acres, or as much as two oxen would
plough; the poiffors of which bacallaries were called bac-
callers.

Cafeneue and Altaserra derive bachelor from bacalius,
or baccius, a flaff, because the young cavaliers exercised them-
selves in fighting with staves. Martinus derives it from
bacalarius, i.e. bacisc laured donatus, in allusion to the an-
tic duadem of crowning poets with laurels, baccia lauri; as
was the case with Petrarch at Rome in 1341. Aciat
and Vives are of the same opinion; nor is this etymology
improbable.

Bachelors, in the livery companies of London, are
those not yet admitted to the livery.

These companies generally consist of a master, two war-
dens, the livery, and the bachelors, who are yet but in
expectation of dignity in the company, and have their function
only in attendance on the master and wardens; they are
also called yeomen.

Bachelor is also a name given in the six companies of
merchants at Paris to the elders, and such as having served
the offices, have a right to be called by the masters and ward-
dens to be present with them, and assist them in some of
their functions, particularly in what relates to the chief d'
seure, or master-pieces, of such as are candidates for being
admitted masters.

Bachelor is also particularly used for a man not married,
or who is yet in a state of celibacy.

The Roman censors frequently imposed fines on old bac-
chelors. Dion. Halicarnassus mentions an old constitution,
by which all perions of full age were obliged to marry.
But the most celebrated law of this kind was that made
under Augustus, called the lex Julia de maritiandis ordinibus,
and by Horace (Carm. Secul. v. 5) lex marita, by which
bachelors were made incapable of legacies of inheritances by
will, unless from their near relations. See Papian-Por-
tean Law.

The Rabbins maintain, that, by the laws of Moses, every
person, except some few, is obliged in conscience to marry
at twenty years of age; this makes one of their 673 pre-
ccepts. Hence these maxims to frequent among their ca-
suluts; such as, that he who does not take among them, is
not a man, but ought to be reputed a homicide. Lycurgus was not more favourable;
by his laws bachelors are branded with infamy, excluded
from all offices civil and military, and even from the floors
and public Sports. At certain feasts they were forced to
appear, to be exposed to the public derision, and led naked
round the market-place. At one of their feasts, the women
led them in this condition to the altars, where they obliged
them to make amends honorable to nature, accompanied with
a number of blows, and lashes with a rod at discretion.
To complete the affront, they forced them to sing certain
songs composed in their own derision.

The Christian religion is more indulgent to the bachelor-
slate; the ancient church recommended it as preferable to,
and more perfect than the matrimonial state.

In the canon law, we find injunctions on bachelors, when
arrived at puberty, either to marry, or turn monk and pro-
fects chality in earnest.

In Great Britain, taxes have been occasionally levied on
bachelors, as by 7 W. III. 1695, which imposed a tax on
such, after 25 years of age, of 12s. 10s. for a duke, and
10s. for a common person: and the taxes laid on others have
been increased with regard to bachelors, as in the case of
the duty on servants by 25 Geo. III. c. 43. See Serv-
Vants.

Bachelors, in geography, a river of South America,
which runs into a bay of the same name, on the north side
of the straits of Magellan. N. lat. 53° 39'. W. long. 73°
2'.

BACHER, the name of a chain of Austrian mountains,
the south of Styria.

Bacher's Toxic Pills, in the Materia Medica. See Hel-
phore, and Pills.

BACHLIAIN, or BACHIAN, in geography, one of the
Molucca islands, lying south from Macbian, and polisified,
since the year 1610, by the Dutch. This is the largest of
the little Moluccas, and is governed by a sultan, who is
likewise sovereign of Oubi and Ceram, together with Gor-
ram. This monarch has a pension from the Dutch, either
for the destruction or supply of nutmegs; but he is other-
wise little subservient. Bachian rises into woody hills, and
through the idleness or oppreffion of its inhabitants, is suf-
fected to become wild and defect, although by cultivation it
is capable of becoming fertile and productive, and it was
represented as formerly producing the best cloves in the Mo-
luccas. On the shores, as in most of the other illes of this
archipelago, there are prodigious rocks of coral, of infinite
variety and beauty. Its principal town is Sabongo; it is
about twelve leagues in circuit, and has a burning moun-
tain. It is situated nearly under the equinoctial in S. lat.
17° 25', and E. long. 125° 5'.

BACHINA, in Ancient Geography, an island of the Me-
diterranean sea, near Smyrna, according to Pliny; called
by Livy, Bachium.

BACHMUT, a town of Russia, in the province of
Ekaterinoslaw, 104 miles W. N. W. of Azof. N. lat. 48°
25', E. long. 37° 44'.

BACHIO, a river of North Wales, which runs into the
Severn near Laniolos, in Montgomeryshire.

BACHOLKZ, or BACHUTZ, a town of Poland, in the
Palatinate of Sandemitz, 20 miles south of Rad-

dom.

BACHOVIUS, REIMER, in Biography, a German ci-
vilian, was born at Cologne, in 1544, and refented at Leip-
sie, where he suffered persecution on account of his religious
principles, as he professed attachment to the doctrines of
Calvin, rather than to those of Luther. Compelled not
only to resign his public offices, but to quit Leipzig, he with-
drew into the Palatinat, and found in the Elector a gene-
rous patron. At Heidelberg, he held several honourable
and lucrative places till his death in 1614. In a theological
work, of which he was the author (1585), he held out
the following arguments in proof of the error of the calvinists,

BAC.
tract, intitled, "The Catechism of the Palatinate," he cited the writings of the fathers in defence of Calvinism. His son, of the same name, was professor of civil law in the university of Heidelberg, which he filled with distinguished reputation for more than 20 years, till the city was taken by count Tilly, and the university was dissolved by the elector Palatine. Upon this event, he quitted Heidelberg; but having suffered many disappointments and vexations on account of his Protestant principles, he returned to Heidelberg, and having united with the Catholic church, he was restored to his office upon the re-establishment of the university. His works, besides other law tracts, are "Exercitationes ad partem polliciorem Chiladi Fabri," published in 1624, folio; "De Actionibus," 1626; "De Pignoribus et Hypothecis," 1627; "Difputationes de variis Juris Civiliis Materius," vol. Heidelberg, 1624; and "In Institutionum Juris Civilis Libros quater Commentariori," 4to. Franö. 1628. Gen. Dict. Nouv. Dict. Hist.

BACHSTELZE, (Weisse Bachhelfe), in Ornithology, the name of the Motacilla Alba, or white wag-tail, in Frisch. Hist. Birds.

BACHU, in Geography. See Baku.

BACILLARIA, in Natural History, a genus of VERMES Infusoria in Gmelin's Syll. Nat. of which only a single species is described, viz. "paraspin." In this genus the body contains of straw-like cylinders placed parallel to each other, and frequently changes its direction and arrangement. Müll. Gmel. &c.

BACILLARIS, a species of Tenia, with the head rounded, and proboscis pyriform; joints extremely narrow, and resembling pieces of straw placed on each other. Goethe infests the interlines of the mœl; size of a very fine thread; neck without joints.

BACILLI, or Bacilli, in the Materia Medica, such compositions as are made up in a cylindrical figure, like a stick; thus called from the Latin baculus, a staff. See Lozenge.

BACINET, in Ancient Armour. See Bassinet.

BACK. See Dorsum.

BACK BONE. See Spine.

BACK, in the Mange, and among Farriers. A horse's back should be straight, not hollow, which is called saddle-backed; horses of this kind are generally light, and carry their heads high, but are deficient in strength and service. A horse with a weak back is apt to stumble.

In the French riding-schools, to mount a horse a dos, is to mount him bare backed, without a saddle.

BACK, in Brewing, a large flat kind of tub or vessel, wherein the wort is put to stand and cool before boiling. The ingredients of beer pass through three kinds of vessels.

They are mashed in one, worked in another, and cooled in a third, called backs or coolers.

To gauge a Brewer's Back. Most backs have their sides strait; in case, however, they be not, make either an acute or obtuse angle with the bottom, the true length and breadth must be carefully taken in the middle of every inch in depth; from whence the area may be found upon every tenth. For finding the area of the back, this rule must be observed, to multiply the length by the breadth, and divide by 282; which gives the contents in ale gallons.

To find the true dip of a Back. Because backs are not placed level, but sloping, for convenience of drawing off the wort; therefore, were the dip taken in too deep a place, the subject would be wronged; as would the king, if it were taken in too shallow a part, to guard against which, as many dips as are thought convenient must be taken; these being added together, and divided by the number of dips, will give a mean depth. When this is done, trial being made in different parts of the back, until one is found which answers exactly to the mean depth; let a mark or notch be made at the side of the back, to point it out as the true dipping place for the future.

The bottom of large backs ought to be every where equally and well supported, to secure them from warping, which else they will do, more and more as they grow older. Those who make backs and other vellls for brewers, are denominated back-makers; and the workmanship confits partly of carpentry and partly of cooperage.

BACK, in the Distillery, a vessel in which liquor is put to be fermented.

BACK, or Dutchman's Cap, in Geography, one of the small islands of Scotland, eleven miles south-east of Coll.

BACK, Iron, is a large plate of cast iron, frequently adorned with figures in low relief, intended to preserve the flonework of a chimney-back, and to reflect the heat of the fire.

BACK a Ship, To, in Sea Language: when the wind is crofs, or nearly off shore, or in the opposite direction, ships will always back by the mizen top-fall, affifted, if necessary, by the mizen fflag-fall. If there be no mizen top-fall, the main top-fall is used. In backing, always keep a flight cable, to wind the ship, that the anchor may be drawn round. If the wind be not fufficient for this purpose, the ship must have a-peak.

BACK the Anchor, is to carry out a small anchor a-head of the large one, in order to support it in bad ground, and to prevent its hoisting or coming home.

Back-stern, in rowing, is to impel the boat with her stern foremost, by means of the oars.

BACK of the Poft, See Stern-Post.

BACK the Sails, is to put them in a situation that will occasion the ship to retreat or move a-ftern. This operation, however, is only performed in narrow channels, when a ship is carried along sideways by the tide or current, and strives to avoid any thing that may interrupt her progres, as shoals, vessels at anchor, &c. or in the line of battle, when a ship would put herself into a situation opposite to another with which she is engaged.

BACKBEROND, or Backerend, in Law Writers, denotes a criminal caught carrying off something on his back.

In this fene Breton uifes it for a species of what the civilians call manifett theft, fortum manifestum.

In the Foref Laevos, backerond is one of the four circumnences, or cafes, wherein a forester may arise the body of prevent disorder against vert or venion in the foret. The others areѣtable-band, dog-drown, and bloody-band.

BACK-BOARD, in Maritime Affairs, is of a semicircular figure, placed transversely in the after-part of a boat, like the back of a chair, to recline again hit while fitting in the stern-fheets.

BACKELEYS, in Zoology, a denomination, derived from backley, which in the Hottentot language signifies ear, and given by the Hottentots to those oxen which they train for war and use with风俗, as the Indians employ the elephants in their combats. In all their armies there are considerable troops of these oxen, which are easily governed, and which are let loose by the chief, when a proper opportunity occurs. They instantly dart with impetuousity on the enemy; striking with their horns, kicking, and tramping under their feet every thing that oppokes their fury. By running furiously into the ranks and putting them into disorder, they prepare an easy victory for their masters. These animals are likewise of great use in guarding the flocks. At the smallest signal from the keeper, they collect and bring back those that wander; and they also
also run with great fury upon strangers, and serve to secure the flocks and herds against the attacks of the buffalies, or robbers of cattle. Every kraal has at least six of these backeleyes, which are chosen from among the finest oxen; and after they have been duly trained, they dextrously direct from enemies, understand signals, and obey the voice of their master. If a stranger, and particularly an European, should approach the cattle, without being accompanied by a Hottentot, his life would be in great danger. These backeleyes would soon run round him at full gallop, and if not protected by the herdsmen, by fire-arms, or by suddenly climbing a tree, his destruction would be inevitable. Kolbe, Voyage and Description du cap de Bonne Espérance, cited by Buffon, vol. vi. p. 184. ed. Smellie.

**Backer, or Barker, Jaques, in Biography, an historical painter was born at Antwerp in 1530, and received instruction from his father: after the death of his father, he refided in the house of Jacopo Palermo, a picture-dealer, who, for the gratification of his own avarice, kept him incessantly employed, and dispofed of his pictures at Paris, where they were much admired and fetched a high price; whilst the artist himself was continued in an obscure and depressed condition. He was distinguished by a clean light manner of penciling, and a very pleasing tint of colour. He died in 1560. Pilkington.**

Backer, or Baker, Jacob, a painter of portrait and history, was born at Harlingen, in 1600, but refided chiefly at Amsterdam; where he acquired the reputation of an extraordinary painter, particularly of portraits, which he executed with strength, spirit, and a graceful rel enamour. He was so remarkable for his expedition, that he is said to have painted the half-length portrait of a lady in one day, though he adorned the figure with rich drapery, and several ornamental jewels. He succeeded also in painting historical subjects; and in this style his picture of Cimon and Iphigenia has been much extolled by connoissiers. In delineating academy figures, his expression was so just, and his outline so correct, that he obtained the prize from all his competitors; and his works are bought up at very high prices in the Low Countries. His capital picture of the Last Judgment, preferred in the church of the Carmelites at Amsterdam, is well defined and well coloured. He died in 1651; or, according to Defamps, in 1651. Pilkington.

**Backereel, called Bacquerelle, William, was born at Antwerp, and was a disciple of Rubens, at the same time with Van Dyck. At the commencement of the exercise of their profession, Backereel was deemed little, if at all, inferior to Van Dyck; as appears from the works of the former in the church of the Augustin monks at Antwerp, where these two great artists painted as competitors; and each posessing a mode peculiar to himself, the superiority was not determined in favour of either. Backereel, by the exercise of his poetical talents, and particularly by his fatires against the Jesuits, incurred the persecution of this powerful fraternity, and by their persecution, he was compelled to leave Antwerp, so that his country was deprived of the honour which must have accrued to it from his performances as a painter. In Italy, and the Low Countries, there were few or even eight eminent painters, of the name of Backereel. Pilkington.**

**Back-Gammon, a game played with dice and tables, to be learned only by observation and practice. This game is said to have been invented in Wales, in the period preceding the conquest, and to have derived its name from two Welsh words, bach, little, and gammon, battle. Gloss. ad Leges Wallseas, a voc. Tawkbrwd, cited by Henry, vol. iv. p. 424. $\S$.**

**Back-Heaver, in Agriculture, a machine long used in several parts of England, particularly in Hampshire, Wiltshire, and Suffolk, for winnowing corn. An improved construction of this machine, illustrated by a figure, was proposed by Dr. Hales, in the year 1747, which, he says, will not only render it fit for winnowing corn sooner and better than by any other means hitherto used, but also for clearing it of the small corn, seeds, blacks, linum-balls, &c. to such perfection, as to make it proper for feed-corn. See Hales's Uses of Ventilators, part ii. p. 247, &c.**

**Backhuysen, Ludolf, in Biography, an eminent painter of ships, sea-pieces, and sea-port, was born at Leyden, in 1631, and after receiving early instruction from Albert Van Everdingen, acquired his principal knowledge by frequently the painting-rooms of great masters, and particularly Henry Drubbels, and observing their various methods of touching and colouring. His improvement was very considerable, and his drawings were in such estimation, that several of them were purchased at 100 florins a-piece. Whilst he was painting, his mind was so much engaged, that he would not allow his most intimate friends to have access to him, least his ideas should be interrupted. He studied nature with singular attention in all her forms; in gales, calms, flearn's, clouds, rocks, skies, lights, and shadows; and he expressed every subject with so sweet a pencil, and such a degree of transparence and luflre, as placed him above all the artists of his time in that style, the younger Vander Valkel excepted. It was his frequent custom to go out to sea in a barge, in order to flore his mind with grand images, directly deduced from nature; and at the moment of his landing, he flew to his palette, that the traces of these incidents which had occurred might not be obliterated by delay. Backhuyzen perfectly understood the management of the chiaro-uro; and he was thus able to give uncommon force and beauty to his objects. He also strictly observed the truth of perspective, in the distances of his vessels, the receding of the grounds on the shores, and the different buildings, which he described in the sea-port. His works may be easily distinguished by an obvolent eye, from the freedom and neatness of his touch; from the cleanasts, and natural agitation or quiescence of the water; from a peculiar tint in his clouds and skies; and also from the exact proportions of his ships, and the gracefulness of their position.

For a picture, exhibiting a multitude of vessels, and a view of the city at a distance, he received from the burgomasters of Amsterdam 1500 guilders, and a considerable present; and this picture was afterwards given to the king of France, who placed it in the Louvre. No painter was ever more honoured by the visits of kings and princes than Backhuyzen; the king of Prussia was one of their number; and the Czar Peter the Great took delight in seeing him at work, and often endeavoured to draw, after vessels which he had designed. He was remarkably affidious; and yet the number of pictures which he finished, and the exquisite manner in which they are painted, are astonishing. He died in 1709. Pilkington.**

**Backing a Colt, in the Manege, the operation of breaking him to the yaddle, or bringing him to endure a rider. To back a colt, they usually take him into plunged ground, troth him a while, to rid him of his wantons; then having one flay to his head, and govern the chaining-rein, the muffer mounts his back, not suddenly, but by degrees, first making several offers, or half-rings; when he hears thee patientely, he mounts in earnej, and settles in his place, cherishing him, &c.**

**Backing Warrants, in Law, denotes the signing of 3 K 2 each.**
such as have been issued by a justice of the peace in one county, by a justice of the peace in another county, which is necessary before they can be executed there. This practice, which had long prevailed without law, is authorized by statutes 23 Geo. II. c. 26. and 24 Geo. II. c. 55. And now, by statute 13 Geo. III. c. 31. any warrant for apprehending an English offender, who may have escaped into Scotland, and vice versa, may be endorsed and executed by the local magistrates, and the offender conveyed back to that part of the united kingdom, in which such offence was committed.

Back-Mails. See Nails.

Back Painting. is used by some for the art of pasting of prints and other designs on glass.

The art consists chiefly in laying the print upon a piece of crown-glass, of such a size as fits the print. In order to do this, the print must be soaked in clean water for forty-eight hours, if it be on very strong, cloth, and hard gummed paper; but if on a soft, spongy paper, two hours will sometimes be sufficient. The picture, being well soaked, must be laid between four sheets of paper, two over and two under it, that the moisture may be drawn out of it. Instead of soaking the print, it may be rolled up and boiled for about two hours, more or less, according to the quality of the paper, in water; and this mode will answer the purpose as well as soaking it. In the mean while, let the glass upon which the print is to be laid be warmed at the fire; then with a hog's hair brush dipped in melted Strasbourg turpentine, spread the turpentine smoothly and evenly on the glass. Then lay the print upon the glass, rubbing it gently from one end to the other, that it may lie clothe. With the finger, rub off the paper from the back side of the print, till nothing can be seen but the print, like a thin film left upon the glass, and let it aside to dry. When it is dry, varnish it over with some white transparent varnish, that the print may be seen through it, which is now fit for painting.

Having prepared a variety of oil colours, which must be ground very fine, and tempered very stiff, lay such colours on the transparent print as each particular part requires, the matter-lines of the print guiding the pencil; and thus each colour will appear fair to the eye on the other side of the glass, and look almost as well as a painted piece, if it be done neatly. The shadows of the print are generally sufficient for the shadow of every colour; but if it be desired to give a shadow by the pencil, the shadows should be laid off in at first, and the other colours afterwards. The chief care to be used in this part of the work, is that of laying the colours on thick enough, that they may be struck plainly through the glass.

Back-River, in Geography. See Baltimore.

Backs, among dealers in leather, denote the thickest and bolt tanned hides, used chiefly for soles of shoes. See Butts.

Backs of a Hip. See Hip.

Back-staff, in Navigation, an instrument, by the French called the English quadrant. It was invented by Captain Davis, about the year 1550; and is of good use in taking the sun's altitude at sea. It consists of three vane, A, B, and C, and of two concentric arches (Plate I. Navigation. fig. 2.) the vane at A, called the horizon-vane; that at B, the shade-vane; and that at C, the fight-vane. The lower arch B (or ED) is of 60 degrees, and that of C (or FG) of 30 degrees.

To use the back-staff. The shadow-vane B is set upon the 60 arch, to an even degree of some latitude, less by 10 or 15 degrees than you judge the complement of the sun's altitude will be; the horizon vane is put on at A, and the fight-vane on the 30 arch FG: the observer's back being then turned to the sun (whence the name of back-staff, or back-quadrant), he lifts up the instrument, and looks through the fight-vane, raising or falling the quadrant, till the shadow of the upper edge of the shade-vane fall on the upper edge of the slit of the horizon vane; and then if he can see the horizon through the flat slit, the observation is well made; but if the sea appear instead of the horizon, the fight vane must be moved lower towards F; if the sky appear, it must be moved upward towards G, and thus tried till it comes right: then he observes how many degrees and minutes are cut by that edge of the fight-vane which answers to the fight-hole, and to them adds the degrees cut by the upper edge of the shade-vane: the sum is the sun's distance from the zenith, or the complement of his altitude. To find the sun's meridian, or greatest altitude on any day, continue the observation as long as the altitude is found to increase, which you will perceive by the appearance of the sea, instead of the horizon, removing the fight-vane lower; but when you perceive the sky appear instead of the horizon, the altitude is diminished; therefore, deduct from further observation at that time, and add the degrees upon the 60 arch to the degrees and minutes upon the 30 arch, and the sum is the zenith distance, or co-altitude of the sun's upper limb.

And because it is the zenith distance, or co-altitude of the upper limb of the sun, and not the centre, that is given by the quadrant, in observing by the upper edge of the shade-vane, add 16 minutes, the sun's semidiameter, to that, which is produced by your observation, and the sum is the true zenith distance of the sun's centre. If you observe by the lower part of the shadow of the shade-vane, then the lower limb of the sun gives the shadow; and, therefore, you must subtract 16 minutes from what the instrument gives: but considering the height of the observer above the surface of the sea, which is commonly between 16 and 20 feet, you may take 5 or 6 minutes from the 16 minutes, and make the allowance but of 10 minutes or 12 minutes, to be added instead of 16 minutes.

Mr. Flamsteed contrived a glass lens, or double convex, to be placed in the middle of the shade-vane, which makes a small bright spot on the slit of the horizon-vane, instead of the shade; which is a great improvement, if the glases be truly made; for, by this means, the instrument may be used in hazy weather, and a much more accurate observation made in clear weather than could be by the shadow.

The theory of this quadrant is very intelligible: for the line AC being horizontal, the arc fGC is equal to the height of the sun above the horizon; but this arc fGC is equal to the sum of the arcs BE + GC: and the arc dF = 90° = the altitude and zenith distance taken together; consequently the zenith distance = the arcs fD + CF = DB + CF.

When the horizon is obscured by hazy weather, Davis's quadrant is of no use; and this often occasions disturbing consequences. Means have therefore been sought for to remedy this defect. Mr. Hadley has recommended and described a spirit level for this purpose. Mr. Leigh proposed to fix a water-level to the quadrant; and he has likewise given the description and use of an apparatus to be added to this instrument, consisting of a mercurial level, which he prefers, with reason, to a water-level. See Phil. Trans. N° 420. K. &c. or Martyn's Abr. vol. vi. p. 357, 358, K. &c.

It has been observed, that one great objection against this instrument is the trouble and time lost in sliding the fight-vane upward or downward, which sometimes cannot conveniently
conveniently be done without taking the quadrant from the eye, by which an opportunity may be lost for making the observation. But this defect is easily removed by having a long index or ruler fitted to the quadrant; or end moving round the centre to which the horizon-vane is fixed, and having the light-vane fixed to the other end. By this contrivance the light vane may be readily raised higher, or lowered, by turning the quadrant of the index about its centre; and this may be done without taking the instrument from the eye.

See Quadrant.

BACK-STAYS of a Ship, are ropes belonging to the main-mast and fore-mast, and the masts belonging to them, serving to keep them from pitching forwards, or overboard. See Stays.

BACK-STAYS, Travellings, are used in bad weather to support the fore and main-top masts; they splice into a span, round the top-mast, under the parcel, and let up in the chain, with a luff-tackle, to an eye-bolt. They travel up and down the top-mast occasionally with tricing lines that splice into a thimble, on each side of the span, and through blocks fixed to the top-mast trellice-trees, and lead into the top.

BACK-WORM, a name given by Spartans to a disease very common among hawks, and called also flinder; which fec. BACO, in Geography, the capital of Mindoro, one of the Philippine Islands, where the Alcaide, or governor, resides. Its environs are well watered by springs proceeding from mountains covered with farfaparilla. See Mindoro.

BACOBA, in Botany, a name by which some authors call the banana tree, or nona frutti breviori. Pilo. BACOFEN, in Geography, a town of Bohemia, in the circle of Boleflawl, five miles N. N. E. from Jang Buntalna.

BACON, swine's flesh, salted, and dried in the chimney. Writers on this branch of economics give rules for the hanging, the salting, and curing of bacon, larding with bacon, &c.

This appears to be in general an extremely improper and unwholesome aliment, especially for people who do not use great exercise; for those who do may almost eat any thing without injury. Swine's flesh, confidered as an aliment, is none of the best; and when hardened by salt, and dried by smoke, it is rendered more indigreible, and in consequence of that, productive of obstructions in a very great degree. We may add, that the heat of bacon frequently becomes rank and acrimonious, and often even exacerbat the mouth and throat.

BACON SWORD, denotes the thick outer skin taken off the lard or fat. Old historians and law writers speak of the service of the bacon, a custom in the manor of Withen

...
dential advocates, that in his judgment the pope was anti-
christ; and he himself had written freely to the pope, con-
cerning the necessity of a reformation. The efforts of mal-
levolence, whatever might have been the real or pretended
causes from which they originated, could not deprive this
great man of the eftem and respect to which his distin-
guished talents and character entitled him. Such was the
high opinion entertained by the cardinal bishop of Sabina,
who was the pope's legate in England, of his genius and
merit, that he requested from him a complete copy of all
his works. As he was restrained, by the prohibition of his
own fraternity, from communicating any of his works to
any person whatever, he at first declined complying with the
cardinal's request; but as soon as he heard that the cardinal-
legate was raised to the pontifical dignity, under the name of
Clement IV. he signified to him by letter his readiness to
perform what his holiness had desired; and the pope affur-
ed him of protection against any interference of his own
order. Bacon immediately began to collect, arrange, and
improve the pieces he had already written, and having di-
gested them into one volume under the title of "Opus
Majus" (the greater work), he sent it to the pope, in the
year 1267, by a special misseng, whose name was John of
Paris, and who was his own favourite disciple. This John
of Paris was a poor boy, of promising talents, taken by
Bacon under his tuition, in order to try by experience the
efficacy of his peculiar mode of instruction; and, as the re-
result of it, he observes, "that there was no room to conceive
any high notions of the perfection of human wisdom, when
it was possible, in a year's time, to teach a young man all
that, with the utmost industry and application, a zealous
inquirer after knowledge was able either to acquire or to
discover in the space of twenty, or even forty years." (See
Opus Majus, p. 29, and Jebb's Preface.) The pope was
so gratified with the present of this learned work, that it
procured for Bacon extraordinary favour and encouragement
in his studies.

With the life of the enlightened and liberal Clement IV.
terminated the tranquillity of this philosopher; for in 1278,
under the pontificate of Nicholas III. and with the function
of his authority, Jerom de Eufculo, or de Ascoli, general of
the Franciscan order, prohibited the reading of his works,
and sentenced him to imprisonment. The pretended cause
of this severity has been fought by four writers in tracts of
Bacon on necromancy, astrology, and alchemy; but the true
reason was most probably that dread of innovation which
Bacon's improvements in science caused in the minds of
bigotted or interested persons. Bacon continued in prison for
ten years; but upon the accession of Jerom de Eufculo to the
papal see, under the name of Nicholas IV., he attempted
to conciliate the favour of the pope, by presenting to him a
treatise "On the Means of avoiding the Infirmities of Old
Age;" but his endeavours feem to have been ineffectual, as
he still remained in prison, and was not released till about
the latter end of this pontificate, when some English noble-
men interceded in his favour, and obtained for him his li-
8erty. Upon his return to Oxford, he wrote, at the request
of his friends, "A Compendium of Theology," of which a
copy is preferred in the Royal library. This work appears,
from internal evidence, to have been written about the year
12H; and as additions were afterwards made to it, it is
hence inferred that the author lived till the year 1292, or
the seventy-eighth year of his age. The learned editor of
his "Opus Majus" dates his death in 1294; but Anthony
Wood, from two MSS. which he mentions, fixes the time of
it to the 11th of June, 1292; and Dr. Freind acquiesces in
this opinion. He is said to have died in tranquillity, in the
college of his order, and to have been interred in their
church. Tradition reports, that in order to prevent the
un charitable occasioned by his enemies, in the earlier period
of his life, and while he was prosecuting his studies, and per-
forming his experiments at Brazen-nofe hall at Oxford, he was
obliged to retire from the university into a solitary place,
called to this day "Friar Bacon's Study," and Mr. Hearne
informs us, that he sometimes retired in the summer to
Sunning Well.

When we contemplate the extraordinary powers and at-
tainments of Bacon, and review the important and useful
discoveries that were made by him in various branches of
science, and compare them with the period in which he
lived, we shall not be surprised that he was distinguished
by the title of "doctor mirabilis," or wonderful doctor; who-
ever might be the reasons which induced the monks of his
order thus to discriminate him. With respect to his know-
ledge of the languages, which he thought to be the founda-
tion of all true learning, it appears that he was perfect ma-
ter of the Latin, Greek, and Hebrew, and that he had
studied those languages with a degree of critical exactness
which renders some of his observations in that part of the
"Opus Majus," which treats on this subject, judicious and
instructive. With various branches of the mathematics he
was well acquainted; and in mechanics his knowledge was
such, that, in the judgment of Dr. Freind, "his greater ge-
nius had not arisen since the days of Archimedes." Ac-
cordingly, in his treatise, intitled, "Epitola Fratris Rogeri
Baconis de secretis Operibus Artis et Naturae, et de Nulli-
tate Magic," he proposes the construction of wonderful
instruments, which may be artificially contrived, by which
such things (lays he) may he done without the help of magic,
as magic itself is incapable of performing. "For a vessel
may be so constructed, and ours therein so dispofed, as to
make more way with one man in her, than another vessel
fully manned." "It is possible (lays he) to make a chariot
which, without any affittance of animals, shall move with that
irrefuible force which is ascribed to thosc scythed chariots
in which the ancients fought." "It is possible," adds our
author, "to make instruments for flying, so that a man fit-
ting in the middle thereof, and bearing with a kind of
ruder, may manage what is contrived to answer the end of
wings, so as to divide and pass through the air. It is no
less possible to make a machine of a very small size, and yet
capable of raising or sinking the greatest weights, which
may be of infinite use on certain occasions, for the help of
such an instrument, not above three inches high, or less,
a man may be able to deliver himself and his companions
out of prison, and to ascend or descend at pleasure." Hence
it has been inferred that Bacon was acquainted with the per-
petual screw. Our author's knowledge of the science of
optics was so accurate and comprehensive, that he is juftly
allowed to have understood the theory and practice of many
of those discoveries, the application of which has been so
important and useful in more modern times. Besides the
depictions of the camera obscura, and of burning glaffes,
which are found in his writings, we have unquestionable evi-
dence that he was well acquainted with the properties of
convex and concave lenes, and with the effects of refrac-
tion; and some have even ascribed to him the honour of
having invented the telecope. (See these several articles.)
In geography his refarches were various and extensive; and
his acquaintance with astronomy enabled him to discover the
effors of the calendar, and to propone the proper method of
correcting them. See CALENDAR.

Although Roger Bacon was in some instances misled
by the visionary projects of the alchemists of his age, and

---

BAC BAC
though he indulged chimerical notions of the medicinal virtues of the aurum potabile, or the tincture of gold, and of a secret charm for renewing the native heat of old men, he was led by his chemical processes into an acquaintance with the properties of bodies, and a variety of discoveries that were no less important and useful than novel and curious. Such, in particular, was that of the ingredients and effects of gun-powder, which was for a long time supposed to have been the invention of a much later period. (See Gun-powder.) Of his medical knowledge we have evidence in his "Treatise on Old Age," blended with many things that are obscure and fanciful; and though he so far partook of the superstition of the times as to frame some confidence in judicial astrology, he was an enemy to accursancy and magic. The imputation on his character of his leaning to magic, was altogether unfounded; and the story of his having constructed a brazen head, which proposed and answered questions, is as ridiculous as it is groundless. The full object of this calumny, was his patron Robert Grothhead or Grothhead, bishop of Lincoln; and similar tales have been related of pope Sylvester II., Albertus Magnus, and other eminent philosophers; but they gained credit merely with mean and ignorant persons. In logic and metaphysics, as well as in philosophy, and the polite arts of learning, Bacon was equal, if not superior, to most of his contemporaries; and his treatise on Ethics, or moral philosophy, contains many excellent principles for directing the judgment, and regulating the conduct. To theology, all his other studies were sublificient; and he directed both his actions and his writings to the glory of God, and of the good of his fellow-creatures. To the holy scriptures he paid due deference; and he enforced the study of them in their original languages, and an affidious application to the several branches of learning which he thought necessary for rightly understanding and interpreting them. This seems to have been the object of his last treatise, which he left as a kind of testament to his order. As the whole life of friar Bacon was spent in study and writing, we need not wonder that his works were very numerous. Bale speaks of upwards of fourteen books written by him; and Dr. Jebb has digested a still greater number, under the distinct heads of grammar, mathematics, physics, optics, geography, anatomy, chronology, chemistry, military, magic, medicine, logic, metaphysics, ethics, theology, philology, and micellany. It seems, however, that the number has been multiplied by means of the different titles under which various copies of the same treatise have been dispersed, and by conferring the titles of distinct chapters of his work, as the titles of separate treatises. Accordingly, eleven of these pieces will be found in the work intitled, "Epitola Fratris Rogeri Baconis, &c.," already mentioned, published in 1410. at Paris, in 1542; in 8vo, 1691; in 1573; and in 8vo, at Hamburg, in 1608 and 1618. This treatise abounds with various physical facts and observations, and exposes the futility of the several practices of necromancy, charms, divination, and magic. The "Opus Majus," written in the form of an epitile or address to pope Clement IV. is professedly a digest of the author's former writings. "In this curious and valuable work, Bacon describes the impediments which hinder men from arriving at true and useful knowledge; illustrates, at large, the usefulness of the studies of grammar, mathematics, and perspective; explains the nature and value of experiments in philosophy; and earnestly exhorts the pontiff whom he addresses, to give all possible encouragement to science in general, and particularly to the study of nature. This work, which affords abundant proofs of the author's superior talents, and, considering the time in which he lived, of his wonderful knowledge, long remained buried in obscurity, and never appeared in print till, in 1733, Dr. Jebb, from various collated MSS. lent from the prefs of William Bowyer, a correct and beautiful edition in folio. Bacon wrote many chemical tracts, most of which may be found in "Thesaurus Chemicus," printed in 8vo, at Frankfort, 1603, 1604, and others are in MS. in the university library of Leyden. His treatise "On the Means of avoiding the Infirmities of Old Age," in which, before a regular course of life, he recommends the use of certain secret and extraordinary medicines, was first printed at Oxford in 1590, and afterwards translated into English, with notes, by Dr. Richard Browne, under the title of "The Cure of Old Age, and Preservation of Youth," 8vo. 1683. Several tracts of friar Bacon, yet unpublished, remain in MS.; a piece, bearing the title of "Liber Naturalium" a treatise on Chronology, intituled, "Computus Rogeri Baconis," and the "Compendium of Theology," are to be seen in the King's library; and two other works, which the author called "Opus Minus," and "Opus Tertium," remain in the Cotton library; and other pieces might probably be found by diligent search."

Although in the present advanced state of literature and science, we could not expect to derive much accession to our means of knowledge from the publication and study of friar Bacon's works, yet as a display of the astonishing powers of the human intellect, and as a valuable part of the history of knowledge, they ought to be preferred and known. The want of a complete edition of his works is the less to be regretted, since the public have been put into possession of his "Opus Majus," by Dr. Jebb.

From the brief account that has been given of the talents and performances of friar Bacon, it will appear, that he contributed, in a very eminent degree, to illuminate the dark age in which he lived, and to prepare the way, by enunciating the mind from the authority of Aristotle, and pursuing a plan of experiment and induction in the prosecution of science, for those discoveries and improvements, which have distinguished a later period. Although allowance should be made for the language of panegyric, which characterizes Bacon as the "brightest and most universal genius that perhaps the world ever saw;" he must ever be regarded as a prodigy of learning and science, and a very high rank must be assigned to him among those who have been instrumets of enlightening and reforming the world. Jebb's Pref. to Bacon's Opus Majus. Cave, H. L. t. ii. p. 325. Bug. Brit.

Bacon, Sir Nicholas, an eminent lawyer, and lord keeper of the great seal in the reign of queen Elizabeth, was the descendant of an ancient and honourable family in the county of Suffolk, and born in the year 1510 at Chilghurft in Kent. He was sent at an early age to Corpus Christi and Benet college at Cambridge, and finished his education by travelling into France. Upon his return, he entered at Gray's ian, and distinguished himself by the study of the law. By favour of Henry VIII., he obtained a grant of several manors in Suffolk, when the monastery of St. Edmundsbury was dissolved; and was appointed attorney in the court of records; which office he retained during the reign of Edward VI. Having, by his prudence and moderation, escaped the dangers of the reign of Mary, he was honoured with knighthood on the accession of queen Elizabeth; and in 1558, he was intrusted with the custody of the great seal, and admitted a member of the privy council. He took an active part in the administration of this period, and was eminently instrumental in the settlement of religion. It has been said, that he incurred the displeasure of Elizabeth by joining
BAC

joining the party that was adverse to the title of the queen of Scots; but from "A Discourse upon certain points touching the inheritance of the crown, conceived by sir Anthony Brown, and answered by sir Nicholas Bacon," published in 1733, by Nathaniel Bothe, of Gray's inn, Esq., from the original MS., it has been inferred, that sir Nicholas Bacon was a most strenuous adherent of the title of the queen of Scots, in opposition to sir Anthony Brown, who had contended for the right of the house of Suffolk. However this be, he was placed by Elizabeth, in 1568, at the head of the commission for hearing the disputes between that unfortunate princess and her rebellious subjects; and in 1571, he again acted in the same capacity. From this time he was a principal agent in the counsels of Elizabeth, and by his inflexible adherence to the Protestant cause, shared the odium of the Papist faction in common with her other principal ministers.

As a statesman, he manifested great skill in properly balancing the different parties, and it is thought that he instructed the queen in the art, which she found so necessary and useful. In the chancery he distinguished himself by a very moderate use of power, and by shewing great respect to the common law. His private as well as his public conduct was regulated with great discretion, and a moderate use of the fortune which he had acquired. His motto was "Mediocria firma," and he was accordingly content to be false, but did not wish to be great. In his later speeches he advocates the reputation of uniting two opposite characters, viz. the gentlemanly and a weighy speaker. That he was not unduly exalted in his own opinion, notwithstanding his eminent talents and preference, appears from his modest answer to queen Elizabeth, when on a visit to him at Redgrave, she told him that his house was too little for him: "Not so, madam," replied sir Nicholas, "but your majesty has made me too great for my house." In deference to her majesty's opinion, he added two wings to it; and he also indulged his taste for building and gardening, at Gorhambury, near St. Albans, which was a manor taken from the ancient abbey of this place. Having retained his office of lord keeper for more than twenty years, with the reputation of a wise statesman and faithful counsellor, he died, after an illness of a few days, on the twentieth of February 1579, in the fiftyninth year of his age. Of his writings there are extant in MS. several discourses on topics of law and politics, and also a commentary on the twelve minor prophets. Biog. Brit.

BACON, Francis, baron of Verulam, viscount of St. Albans, and high chancellor of England in the reign of James I., the glory and ornament of his age and nation, was the son of sir Nicholas Bacon, mentioned in the last article, by his second wife Anne, the daughter of sir Anthony Cook, tutor to king Edward VI.; and born in London on the twenty-second of January 1561. In his childhood he manifested indications of singular genius, from which those who conversed with him might have deduced prelages of his future attainments. In reply to queen Elizabeth, who asked him how old he was, he infantly replied, "Just two years younger than your majesty's happy reign," and her majesty, condescending frequently to converse with him, and forming a high opinion of the solidity of his feelings and gravity of his behaviour, used pleasantly to call him "her young lord keeper." At the age of thirteen, in the year 1573, he was entered a student in Trinity college, in the university of Cambridge, where his progres under the tuition of Dr. John Whitgift, afterwards archbishop of Canterbury, was rapid and surprising. Before he had completed his sixteenth year, he began to percieve the imperfections of the Aristotelian philosophy, which was then the reigning system, and probably to form designs of introducing a more rational and profitable method of pursuing philosophical researches. To this purpose, we are assured by Dr. Rawley, who was his chaplin and biographer, and to whom he communicated several particulars relating to the earlier period of his life, that his objections against the prevalent philosophy were not owing to any disrespect of Aristotelianism, of whom he entertained a very high opinion, but to the inutility of his philosophy, which was calculated to produce and perpetuate disputes, rather than to afford any substantial benefit to mankind; and these sentiments of it he retained through life. In order to perfect his education, and to extend his knowledge of the world, his father sent him to France, and placed him under the patronage of sir Amias Pawlet, who was then the queen's ambassador at Paris. In this situation he gained the esteem and confidence of sir Amias to such a degree, that he was intrusted with him with a commision to the queen, which required both secrecy and dispatch; and having executed this commision in a manner highly honourable to himself, and equally satisfactory to the queen and ambassador, he returned to Paris, and from thence travelled through several of the provinces, for the purpose of gaining a more accurate and extensive acquaintance with the manners and customs of the country. The result of his inquiries appears in a treatise, intitled "Of the State of Europe," and written when he was no more than nineteen years of age. The unexpected death of his father obliged him to return suddenly from France, and to engage in some lucrative profession. Accordingly he determined upon the profession of the law, and entered himself in the Society of Gray's Inn, where by affidious application he obtained such a degree of reputation, that at the age of twenty-eight years he was appointed by the queen to the honourable office of her learned counsel extraordinary in the law. Whilst he was studying at Gray's Inn, and in the twenty-sixth year of his age, he formed the plan of that great philosophical work, afterwards completed, and intitled, the "Inflation of the Sciences," which will not only render his name immortal, but do honour to his age and country, as long as learning shall flourish. The title of the work which our author composed at this time, was "Tempestitum partum maximum," or the "Greatest birth of time;" with respect to which it appears, from a letter written towards the close of his life to father Fulgentio, a learned Italian, that he lived to regret the juvenile folly and vain confidence which led him to prefix to it this pompous title. These rudiments of Bacon's philosophy have been supposed to be lost; but it has been dugged (see Mallet's edition of Bacon's works, Append. to vol. i. p. 17.) that they probably remain under the more modest title "Of the Interpretation of Nature," and that philosophers may fill have the pleasure of tracing the steps by which this great genius advanced from one discovery in science to another in forming and establishing his system. From the high rank of a philosopher, in which Bacon appears with acknowledged pre-eminence, we are obliged to descend, in tracing the outlines of his history, to the level of ordinary men, and to contemplate him as an humilitating example of human frailty. Reduced by his father's death to circumstances which rendered it necessary for him either to pursue his philosophical speculations in obscure retirement, or to become an obnoxious dependant on the court; he unfortunately chose the latter alternative. Allied by marriage to the lord treasurer Burleigh, and to his son Robert Cecil, principal secretary of state, he indulged reasonable expecta-
his preferment. The interest of lord Burleigh procured for him merely the reversion of the office of registrar to the flarm-
chamber, worth about 1600l. a year, which he did not ob-
tain for twenty years. In 1594, Cecil represented him to
the queen as a man wholly devoted to speculation, and pre-
vented his being advanced to the post of solicitor-general,
which the earl of Effex endeavoured to procure for him; but
as a compensation for this disappointment, the earl presented
him with a landed estate, which was afterwards sold, at his
than its value, for 1800l. Bacon, however, after this sin-
gular expression of friendly attachment on the part of Effex,
proved ungrateful; and in the moment of danger abandoned
his friend and benefactor; pleaded against him on his trial
for high treason; produced evidence to his injury from his
letters; and after his execution, vindicated the conduct of
administration, in an appeal to the public, under the title of
"A Declaration of the Treasons of Robert earl of Effex." In
this "Declaration" there occurred some apparent marks of
tenderness for the reputation of Effex, which led the queen
to observe to him, that "old love could not easily be for-
gotten;" but whilst they proved that he was counteracting
his feelings by his conduct, they were insufficient to excite
the baseness of his ingratitude. His conduct on this
occasion excited against him such general dissatisfaction, that
he found it necessary to write an elaborate defence under the
title of "Apology;" but no art or eloquence could avail to
flute the public indignation. From the queen he received
no additional honours or emoluments during the remainder of
her reign; and to persons in power he was an object of jea-
lozy and aversion.

In public concerns, however, he acted with firmness and
dignity. Having been chosen, in 1593, to represent the
county of Middlesex in parliament, he took the popular side,
though a servant of the crown, against her majesty's mini-
fiers; and in the question of subsidies, to which he indeed
attended, he delivered a speech, the freedom of which offended
the queen, and prevented his advancement. Towards the
end of her reign he became more servile in his parliamentary
conduct; for which his only plea was his poverty, and debts
which he had incurred, and for which he had been twice
arrested.

Upon the accession of James I. Bacon was distinguished
by the favour of his new sovereign, and in 1603 received
the honour of knighthood. In the first parliament of this
reign, he regained his popularity by undertaking the redress
of grievances, arising from the exactions of the royal pur-
voyers; and in the conduct of this business he gave satisfac-
tion both to the house and to the king. From the former
he received a vote of thanks, and from the latter a patent to
be one of the king's councillors, with a salary of 40l. a year,
accompanied with a pension from the crown of 60l. a year,
for special services rendered by his brother Anthony Bacon
and himself. Notwithstanding the opposition of Cecil, now
earl of Salisbury, and of Sir Edward Coke, attorney-general,
he pursued with steady perseverance his plans of advance-
ment; and by promoting the king's favourite object of an
union between the two kingdoms, and by publishing, in 1605,
one of his most important works, "On the advancement
of learning," he so far succeeded in gaining the favour of
his royal master, that in 1609 he was appointed to sup-
ply the place of Sir John Dodridge, as solicitor-general.
His practice also was at this time very extensive and profit-
able, and he also improved his fortune by marriage with the
daughter of Benedict Barnham Esq., a wealthy alderman of
the city of London. Whilst he displayed his eminent talents
both in the senate and in the courts, he was not in-
tentive to his grand philosophical speculations and pursuits.
Vol. III.
all his powers of eloquence to induce the peers to content themselves with dismissing him from the high office which he had disregarded. They insisted, however, on a particular confession, respecting each article of bribery and corruption of which he was accused; and the chancellor confessed his guilt with regard to most of the twenty-three articles of corruption which were exhibited against him, whilst he extenuated some of them, and again threw himself on the mercy of the house. Upon being asked whether the confession which had been read was written by his own hand, he replied, "It is my act, my hand, my heart; I bequeath your lordships to be merciful to a broken reed." The house moved his majesty to sequestrate the seales, which was accordingly done; and then proceeded to pass sentence; which was, "That the lord viscount St. Albans, lord chancellor of England, shall undergo fine and random of 40,000l.; that he shall be imprisoned in the Tower during the king's pleasure; that he shall for ever be incapable of any office or employment in the state or commonwealth; and that he shall never fit in parliament, or come within the verge of the court." This sentence, severe as it may seem, and for which collateral causes have been alleged, was the result of the strict exercise of justice. Thus degraded under a full sentence, we cannot forbear pitying a man, who, among other crimes, suffered his servants to become the instruments of his ruin; and who in passing by several of his retinue, that stood up to salute him, facetiously said to them; "Sit down, my masters; your rife has been my fall."

Thus degraded and banished into solitude, reproached by his own mind as well as by the public confence, and depreved by a load of debt, he retained the vigour of his faculties to such a degree, that he returned with ardour to his favourite pursuits, and produced various writings of singular merit in history, morals, and philosophy. Through all the vicissitudes of his life, he kept in view the great object of the improvement of science, to which his attention was directed in the early period of his youth. From contemplating the examples of Demoithenes, Cicero, and Seneca, who, like himself, had occupied high stations, had fallen into delinquency, and had been banished into retirement, he derived consolation; and in imitation of them, he determined to devote the remainder of his time to philosophy, and writing. He might, indeed, have adopted the language in which Cicero addresses philosophy; "Ad te confingit a saud tur ante muros ex parte, et ante muros totosque tradimus." "To thee I fly; from thee I seek support; to thee I devote myself, as formerly in part, so now entirely and altogether." It is observed, however, that neither philosophy nor experience had taught Bacon a lesson of moderation. After his release from confinement in the Tower, which was soon granted him, and the entire remission of his sentence gradually obtained, he proceeded a royal pension of 1200l. a year, in addition to 600l. a year, accruing to him from the abatement of four years, and 700l. a year derived from his own estates; but he lived with a magnificence and splendor which had no bounds. In his way to London, his coach was attended by a number of attendants on horseback; he was met by the prince of Wales, who asked whole equipage it was, and being told that it was lord St. Albans, attended by his friends, his highness remarked, "Will I do what we can, this man learns to go out like a king." With such prodigality, it is no wonder that at his death his debts should have amounted to 22,000l. As an instance of his humility, we may cite his reply to the French ambassador, who, upon reading a French translation of his Essays, paid him the fulsome compliment of comparing him to angels; "If the philosophers of others compare me to an angel, my own infirmities remind me that I am a man;" and of self-command we have a singular display in his behaviour, when he received information by a friend that his application for an important favour at court had proved unsuccessful; at this time he was dictating to his chaplain an account of some experiments in philosophy, and he calmly said, "Be it so;" and dismissing his friend with thanks for his service, he turned to his chaplain, saying, "Well Sir, if that business will not succeed, let us go on with this, which is in our power;" and he continued to dictate to him for some time, without hesitation of speech, or interruption of thought.

Lord Bacon purfued his philosophical researches to the last, in the midst of bodily infirmities, occasioned by intense study, multiplicity of business, and, above all, by anxiety and anguish of mind. In the winter of 1625, his health and spirits were much impaired; but in the following spring he made an excursion into the country, for the purpose of making experiments on the preservation of bodies. Having exposed himself imprudently to noxious effluvia, he was suddenly feized with pains in his head and stomach, which made it necessary for him to stop at the Earl of Arundell's house at Higher. Here he fell sick of a fever, and, after a week's illness, expired on the ninth of April 1626, in the sixty-sixth year of his age. In a letter addressed to the nobleman in whose house he expired, he compares himself to the elder Pliny, who lost his life by approaching too near to mount Vesuvius, during an eruption. He was buried in the chapel of St. Michael's church, within the precincts of Old Verulam. Verses to his memory were written in various languages by the most eminent fcholars of the university of Cambridge; but the most honourable memorial of this great man is found in his immortal writings.

Before we can duly appreciate the value of lord Bacon's philosophical works, we should duly consider the state of philosophy, and the method of purifying science which prevailed, at the period in which he lived. The authority of Aristotle was absolute; his logic, physics, and metaphysics, were the principal guides in all scholastic disquisitions; and the science that was principally cultivated was such as consisted of words and notions, and seemed to exclude the study of nature. Instead of investigating the properties of bodies and the laws of motion by which all effects are produced, this science, or philosophy, if it may be so called, was confounded about logical definitions and distinctions, and about speculations that were altogether barren and unprofitable. This kind of captious philosophy was not only useless, but a real obstacle to all advances in sound learning, human and divine. Some few persons, indeed, had before the time of lord Bacon ventured to differ from Aristotle; and the fields of natural knowledge had been cultivated and improved by sir Isaac, Galileo, Copeius, and others. But there was still wanting one great and comprehensive plan that might embrace the almost infinite variety of science, and guide our inquiries right in all. This, lord Bacon first conceived in its utmost extent, to his own lasting honour, and to the general advantage of mankind. To him belongs the praise of having invented, methodized, and in a considerable degree perfected, this general plan for the improvement of natural science by the only sure method of experiment. With a mind commanding and comprehensive, prompt in invention, patient in inquiry, and subtle in determination, neither afflicting novelty nor idolizing antiquity, he formed and in a great measure executed his grand plan, "The Institution of the Sciences." This plan comprehended all capital parts. Of these, the first part proposes a general survey of human knowledge, and is executed in the admirable treatise, intituled, "The Advancement of Learning." He begins with
with accurately reviewing the state of learning as it flow
through all its provinces and divisions; that he might not
lose himself on a subject to vast and of such variety, he
ranges, according to the three faculties of the soul, memory,
fancy, and understanding, the several sciences and arts un-
der three great classes, history, poetry, and philosophy. He
observes and points out defects and errors; and then fugg-
sists proper means for supplying omissions and rectifying
mishakes. At the end of this treatise he has marked out
in one general chart the several tracts of science that lay
still neglected or unknown.

The second, and the most considerable part, is the "Novum
Ornament," or new method of employing the reasoning fac-
culties in the pursuit of truth. Here our author offers to
the world a new and better logic, calculated not to supply
arguments for controversy, but acts for the sake of mankind;
not to triumph over an enemy by the sophistry of disputa-
tion, but to subdue nature itself by experiment and inquiry.
Rejecting syllogism as a mere instrument of disputation, and
finding no certainty in the hypothetical systems of ancient
philosophy, the author recommends and explains the more
flow but more satisfactory method of induction, which sub-
jects natural objects to the test of observation and experience,
in order to furnish certain facts as the foundation of general
truths.

The third part is the "Sylva Sylvarum," or history of na-
ture, which furnishes materials for a natural and experimental
history; upon which the organ, or the instrument, which the
author has provided for the investigation of nature, may be
employed. The phenomena of the universe are ranged in this
repository under three principal heads, viz. the history of gen-
erations or the production of all species, according to the or-
dinary laws of nature; that of preter-generations, or births devi-
ating from the father rule; and the history of nature as confined
or addicted, changed or tortured by the art of man. Of such
a history the use is either to acquire the knowledge of quali-
ties in themselves, or to serve for the first matter of a true
and useful philosophy. The facts and observations that are
here collected together are possibly not always correct; but
they are valuable, as they furnish a pattern of the manner in
which such researches should be pursued.

The fourth part, or "Scala Intellectus," is a series of steps
by which the understanding might regularly ascend in its
philosophical inquiries; and it is evidently intended as a par-
ticular application and illustration of the author's method of
philosophizing.

The fifth part, or "Antiquitates Philosophiae sive,"
was designed to contain philosophical hints and suggestions,
but nothing of the remains besides the title and scheme.

The sixth, and final part, was propsoed for exhibiting
the universal principles of natural knowledge, deduced from
experiments, in a regular and complete system; but this the
author despaired of being himself able to accomplish.
Having laid the foundation of a grand edifice, he left the su-
perstructure to be completed by the united and continued la-
bours of philosophers in future ages.

Among the more popular works of lord Bacon, the prin-
cipal are his "History of Henry VII." which, allowing for
some faults, and particularly for its partiality to Henry, with
a view of flattering his grandifon James, at what deal it
was written, may be justly admired for vigorous conception
and energy of language; his "Wildom of the Ancients," in
which he endeavours, with greater ingenuity than solidity,
to unveil the hidden feme of the fabes of antiquity; his
"Moral Essays," containing many just reflections on subjects,
which, in the author's own parliology "come home to
men's busines and bofoms;" and his law tracts, speeches,
letters, and other miscellaneous papers, relative to personal
or public affairs, and abounding with curious and interesting
matter. These valuable writings, which were gradually col-
lected, have been repeatedly published on the continent in
Latin. An edition in folio was printed at Frankfort in
1665; and another by Arnold at Leipsic, in 1694. They
have passed separately and collectively through several ed-
tions in English; in 1740, they were published in 4 volumes,
folio; but the most complete edition is that printed at
London in 1778, in five volumes, quarto.

The character of lord Bacon seems to be pretty fully de-
lincated by Mr. Hume in his History, vol. vi. p. 52. He
represents him as "a man universally admired for the great-
tude of his genius, and beloved for the courtesies and hu-
manity of his behavior." He was the great ornament of his
age and nation; and nought was wanting to render him the
ornament of human nature itself, but that aught of mind
which might check his temperate desire of preference that
would add nothing to his dignity, and refrain his profuse
inclination to exasperation that could be requisite neither for
his honour nor entertainment. His want of economy, and his
indulgence to fervices, had involved him in necessities; and,
in order to supply his prodigality, he had been tempted to
take bribes; and that in a very open manner, from tutors in
chancery. "If we consider," says he, "the variety of
talents displayed by this man; as a public speaker, a man of
business, a wit, a courtier, a companion, an author, and a
philosopher, he is justly the object of great admiration." He
adds; "if we consider him merely as an author and phi-
losopher, the light in which we view him at present, though
very estimable, he was yet inferior to his contemporary Gal-
ileo, perhaps even to Kepler." "The national spirit," adds
Hume, "which prevails among the English, and which forms
their great happiness, is the cause why they hellow
on all their eminent writers, and on Bacon among the rest,
such praises and acclamations as may often appear partial
and excessive." In answer to these strictures it has been
justly observed (Brit. Biog. vol. iv. p. 154.) that "Galileo
was undoubtedly an illustrious man, and Kepler an admira-
able astronomer; but though we admit their superiority in
astronomy, mechanics, and some particular branches of phy-
cical knowledge, it does by no means follow that either of
them was a greater philosopher than Bacon. The praise of
Bacon is founded not upon his skill in this or that particular
branch of knowledge, but on his great and comprehen-
sive understanding, which took in almost the whole extent
of universal science. And he was so little indebted to the
partiality of his countrymen, that his writings appear, for
some time at least, to have been more esteemed and admired
in foreign countries than in England."

Mrs. Macaulay expresses in very strong terms her abhor-
rence of his character, when she says (vol. i. p. 157.), that
"philosophy itself was degraded by a conjunction with his men-
soul." But with respect to the strength and extent of his
genus, this female writer says, "his precious bequests to
posterity paint them stronger than can any other pen." It
must however be confessed, that it was some discredit to
Bacon, that he could not perceive the reasinable benefits of
the system of Copernicus; but perhaps he understood less
of astronomy, and was less sensible of its deficiencies, than
of any other part of science and philosophy. With confi-
dence in the merit of his own productions, and affarming him-
selves of posthumous fame, lord Bacon introduces in his last
will this remarkable passage:—"My name and memory I
leave to foreign nations; and to mine own countrymen, after
some time is passed over." Upon the superstructure
that has been reared on the foundation of experimental phi-
lophoy
BAC

lophry which he has established, this inscription will be read, says one of his biographers, by dilatant politeness, "Bacon, the Father of Experimental Philosophy."

Upon the whole, in contemplating the character of Bacon, exclusively of his incontestable merit as a philosopher, notwithstanding all the allowances that are made in his favour, from the spirit of the times, from his own peculiar circumstances, and from other confederations, yet, when we call to mind his flabby submissiveness in general to the will of the crown, and especially his ingratitude to Essex, and his corruption as a judge, we are constrained, though not without great regret, to acquiesce in the justice of the description given of him by Mr. Pope, (Eff. on Man, ep. iv. v. 277.)

"If parts allure thee, think how Bacon fin'd, The wiseft, brightest, meanest of mankind."

Acknowledging the propriety of this representation, we may infer from it the infinite superiority of the pursuits of intellect above those of ambition. "Had Bacon contented himself with being a philosopher, without aspiring after the honours of a statesman and a courtier, he would have been a greater and a happier man." Mallet's Life of lord Bacon, prefixed to the edition of his works, 1753. Brucker's Hist. Phil. by Enfield, vol. ii. p. 520, &c. Biog. Brit. Gen. Bioi.

Though not a practicall musician, nor a writer ex profeso on the musical art or science, yet it is so manifest by his Nat. Hist. cento ii. that he had done music the honour to bestow much meditation on the theory of sound, we are proud to devote to him an article among music's benefactors.

He treats of the philosophy or production of sound, not by calculation, but by observation and experiments on Nature herself. He does not call octaves replicates (which is a Gallicism), but a recurrence. He thinks (and thinks rightly), that our not cultivating quater tones, or enharmonic, is from their not being capable of harmony; and it seems a proof, among others, that the ancient Greeks had no harmony, or music in parts.

He speaks of sliding from one found to another by small degrees, which are delightful. This we used to think a refinement of late times.

The clavicin acousticum, or ocular harpsichord of Pere Calet, was certainly suggested to him by the experiment, No. 2, second cent.

The powers of sound on the spirits and affections; that found depends on motion; that the inclosure of sound increases its force; that the tone of voice at the same pitch is of a different quality in a room, and in the open air, and in different rooms, are his discoveries. He denies, indeed, what was afterwards proved by the air-pump, that sound could not be produced in an exhausted receiver.

Sound is carried along a wall better than in open space; and better on the smooth surface of a river or piece of water, than on land.

Dr. Holder, in his Elements of Speech, has but ingenuously extended one of sir Francis Bacon's experiments.

Derham's experiments on the propagation and motion of sound, were pointed out by the 20th experiment of sir Francis.

The late honourable Daines Barrington's experiments on birds, their power of imitation, and of teaching each other, seem to have sprung from sir Francis's experiments on the imitation of sound, cent. iii.

Conform of visibles and invisibles, advances somewhat further towards an ocular harpsichord.

The fons harmoniques, which Galileo and father Merfennus were observing about this time, had not escaped the penetrating and active mind of our great philosopher; and the aoustician, or ear-trumpet, is here first pointed out, No. 285.

His reflection at the end of No 290, shall close this article.

"We have laboured, as may appear in this disquisition of sounds, diligently; both because found is one of the most hidden portions of nature, and because it is of a virtue that may be called incorporeal and immaterial; whereof there be in nature but few. But, were we willing, now in these our first centuries, to make a pattern or precedent of an exact inquisition, and we shall do the like hereafter on some other subjects that require it. For we defire that men should learn and perceive, how severer a thing the true disquisition of nature is; and should accustom themselves by the light of particulars to enlarge their minds to the amplitude of the world, and not reduce the world to the narrowness of their minds."

BACON, in Geography, a town of Persia, in the province of Segidian; 90 miles N. N. E. of Zareng.

BAConE, a town of Italy, in the duchy of Tuscany, 28 miles N. E. of Florence.

BAConTHORP, or Bacon, John, in Biography, an English monk of the thirteenth century, was born at Baconthorp, a village in Norfolk, and assumed the monastic habit in the convent of Blackney in the same county. He received his education at Oxford and Paris; and in his youth was attached to the philosophy of Averroes, who taught that one intelligent principle animates all human beings. At a general assembly of the order of English carmelites held in London in 1329, he was chosen one of their provincials. Being invited to Rome about four years afterwards, he gave offence by allowing, in public disputation, too much latitude in the marriage of persons mutually related. But he afterwards maintained, that in degrees of consanguinity prohibited by the divine law, the pope has no dispensing power. His stature was small; but his mind was eminently vigorous and active. He was distinguished through life by the appellation of the "Resolute Doctor;" and after his death he was celebrated both in prose and verse, as a zealous defender of the Catholic faith against Jews, Turks, and Heretics. Some few of the many books which he wrote were printed; among these were "Commentaries, or Quellions on the four books of Sentences," Milan, 1510, and 1611; and "A Compendium of the Law of Christ," Venice, 1527. He died at London in 1546. Cave, H. L. vol. ii. Appendix, p. 27. Biog. Brit.

Species, 1. B. aquatica. Aulib. Guian. 129. t. 49. This plant puts forth several cylinders, succulent, knotty items; leaves opposite, item clasping or rather connate, thick, oblong, concave, sharp, smooth; flowers solitary, peduncled, alternate from the axil; below the calyx there stands a pair of fleshy bractes on the long peduncle; corolla blue.
It puts forth roots from the knots, both as it runs along the ground, and as it lies on the surface of the water. A native of Cayenne, on the borders of rivulets, flowering in December. The inhabitants of the island call it borba aux brulures, on account of its being used for curing burns.

**Bacquer, Benedict.** In *Biography.* Of this writer, who lived towards the end of the seventeenth century, but of whose life no memorials have come to us, we have a much extemned work, "Salvator Senus," published 1672; and, if it is not the same work, "Senum Medicus, prefcribent obseruanda, ut sine magis meliora fymctus praehatat," Colom. 1673, and 1683, 8vo. Hailer Bib. Med. Præct. Mont. Carrera says, that Bacquer was professor of theology, and prior of the abbey of Dunes, which Eloy observes is very probable, as at the end of the directions for the preparation of the health of aged persons, is another work intituled, "Saluator Senus, remedii fuggerans pro Senum salute eterna." Eloy. Diction. Hist. De la Med. v. i. p. 242.

**Bacquet, John,** a learned French lawyer, was advocate to the king, and flourished at the close of the sixteenth century. He wrote many excellent law-tracts, which were published with notes by Ferriere at Lyons, in 2 vols. folio, in 1744. He died in 1597. Nouv. Dict. Hiflor.

**Bacstiau, or Bart Jesse, Servants of Jezes,** a Christian family famed in the East for their knowledge of phyric.

**Bactisia, George,** the first of the family of whom we have any account, who besides his skill in medicine, was eminent for his proficiency in the Persian and Arabic languages, received his education at Jondifabur, or Nifarfur, the capital of Korasan. Sapor's king of the Persians is said to have built this city, A. C. 272, in honour of his queen, the daughter of the emperor Arudhian, who fent with her several Greek physicians. Thfe-men, settling there, received and propagated the doctrines of Hippocrates, in the east, and hence, Friend conjectures, it happened, that most of the celebrated Arab physicians, Rhazes, Haly Abbas, Avicenna, were educated in the more eastern parts of Asia. George, being sent for to Bagdad, by Almanzor, the second caliph of the house of Abbas, to relieve him of a complaint of his loins, in which he was successful, was detained there, and at the desire of the caliph, translated several books of phyric; and when, on account of his ill health, he desired leave to return to his country, Almanzor sent him home with great honour, and a reward of 10,000 aurei. Rhazes and Scarpion have recorded in their works many of the maxims and medicines of George. The answer was remarkable which he made to Almanzor, who had condescended to solicit his conversion from Chritianity to Mahometanism, and offered to infize him a place in paradise upon his compliance. "No," replied the doctor, "I am very well contented to go whereover my forefathers have gone, be it to heaven or to hell." Ruffel's Aleppo, vol. ii. Append. p. 5.

**Gabriel,** the son of George, was in equal estimation with the caliph Haroun Al Rachiid, whom he cured of an apoplexy, by directing him to be blooded, which was performed, though contrary to the opinion of the other physicians. Friend annexed to his History of Phyric, the life of Gabriel, translated into Latin, from the Arabic of Abi-Oflai. The translation was performed at the expence of Dr. Mead. The work is principally remarkable for the extravagant praises bestowed on Gabriel, and the account of the high honours and prodigious wealth heaped by the caliphs on their physicians. Friend's History of Phyric, vol. ii. Haller. Bib. Med. Præct. For an account of others of this family, which in succession supplied the caliphs with physicians for above two centuries; see Ruffel's Aleppo (ubi supra).

**Bactria, or Bactriana,** in *Ancient Geography,* a country of Asia, was bounded on the west by Margiana and Asia, on the north by the river Oxus, which separated it from Sogdiana, on the south by the mountains called Paropamisus, which covered the north of India, and on the south by mountains which separated it from Afric Scythia and the country of the Maffgets. It comprehended the present provinces of Balk and Gaur, and probably, says major Renner, part of Xorasan. It was a large, fruitful, and well-peopled country, and contained, according to Ammianus Marcellinus (liv. xiii.), a great number of cities mentioned by the ancients; hence the metropolis was Bactia, called also Zariafpa, and now Balk, from which, or from the river Bactria, the country derived its name. Quintus Curtius (l. viii. c. 4.) deduces the name both of the city and country from the river Bactris, which watered the environs of the capital. Pliny (l. vii. c. 15. 16.) places Bactra on the river Zariafpa; and Curtis, on the Bactris, at the foot of mount Paropamisus; but Ptolemy describes it as situated on the river Dargodus, in the heart of the country, at a great distance from this mountain, which was the southern boundary. The chief rivers of Bactria, with regard to the names of which there is considerable confusion, were the Oxus, the Oechus, the Orgomenes, or as Ptolemy calls it, Dargomenes, which, uniting with the Oechus, fell into the Oxus; the Zariafpa, or Zariafes; the Arsaces; and the Dargodus. The part of Bactria, which was watered by the river Oxus, is described by the ancients as a very fruitful country, abounding with pastures, and well stocked with cattle of a very large size; but the southern parts were sandy deserts, through which travellers journeyed only in the night, being under a necessity of guiding themselves by the stars, as if they were at sea, and exposed to the danger of being buried in the sand. The country was inhabited by the following nations: the Salatras and Zariafes; the Chomari, or Comarians, placed by Ptolemy near the sources of the Iaxartes, toward the eastern boundaries of Sogdiana; the Comi; the Acinacæ; the Tambahæ, or Tamyzi; the Thucarae, or Tochari, who were mountaineers on the declivity which regards Bactria, whence the modern Tokefaian; the Marycæ; the Scordæ; the Varsi; the Arâda; the Orfippi; the Amansip, and some others. The Bactrians in general were reckoned good folders, and were always at war, either among themselves, or with the neighbouring nations. Herodotus says they were archers, and sted bows made of their country reed or cane, and had short darts. In other respects they were accoutred, like the Medes, who wore tiaras, tunics, and breeches, with a dagger at their girdles. They were enemies to every kind of luxury. Pliny informs us, that they used to expose their old people after a certain age, to be devoured by fierce mastiffs, which they kept for that purpose, and called cephalchial dogs. He adds, that they allowed their daughters to associate with any whom they liked, and that incontinence was not disreputable even to the women.

The early history of Bactria is, like that of other ancient nations, involved in considerable obscurity and uncertainty. According to Diodorus, the Bactrian government, in the earlier ages, was monarchical. Zoroaster is said by Eufebius (in Chron.) to have reigned in Bactria, and to have been contemporary with Ninus, who made war upon him, and subdued his country. But Ctesias, followed by Diodorus, mentions one Oxystates, who reigned in Bactria, when that country was reduced by Ninus, and he says that Zoroaster was contemporary with Cyrus the Great. But the history of this Persian lawgiver is lost in remote antiquity. It has been affected by some writers, that Ninus subdued all Asia, except India and Bactriana. However this be, all authors are.
are agreed, that Bactria was subdued, first by the Affyrians, and afterwards by the Parthians under Cyrus the Great. After the overthrow of the Perisan empire by Alexander (B.C. 328.), it fell under the power of the Macedonians, and was held by the successors of Scælenus Nicator, till the reign of Antiochus Theos, when Theodotus, about the year B.C. 249, from being governor of that province, became king, and strengthened himself so effectually in his new kingdom, while Antiochus was engaged in a war with Ptolemy Philadelphus, king of Egypt, that he could never afterwards dispossess him of his acquisitions. He was succeeded by his son Theodotus, who, strengthening himself by an alliance with Arfaxes, the founder of the Parthian monarchy, considerably enlarged his kingdom. Theodotus, being vanquished by Euthydemus, was expelled the king-
dom; and Euthydemus was succeeded by his brother Me-
ander, who extended his conquests to several countries that were unknown to Alexander the Great. The possessions which Meander had reduced were retained by his nephew and successor Demetrius, and enlarged by several new acqui-
sions. Having left the kingdom of Bactria in a very flour-
rishing condition, he was succeeded by his son Eucratides, who invaded India, and made himself master of all those provinces which had been subjected by Alexander. During the reigns of these six princes, the commerce of Bactria with India was very considerable. The district near the mouth of the Indus, which Alexander had subdued, was recovered; and military operations were carried on in India, with such succe-
sses, that the Bactrian kings, penetrated far into the in-
terior part of the country; and proud of the conquests which they had made, as well as of the extensive dominions over which they reigned, some of them assumed the title of "Great King," which distinguished the Perisan monarchy in the days of their highest splendour. Apollodorus, the Bactrian historian, affirms that Eucratides possessed one thou-
sand cities. The learned Bayer, in his interesting history, advances many arguments to prove that the Greeks of Bact-
tria imparted the first lineaments of science to the Hin-
doos. M. Pizon, in his "Antiquities of Nations," alleges, that there was a people in the upper regions of Asia, be-
yond Media and mount Imaus, who in the first ages spread themselves over Bactria and Margiana, and proceeding by Armenia and Cappadocia, at last passed over into Europe. These people were called Sace. In the mean time, the Cimmerians, who were of the same family, went by the north; and having made various incursions, at last settled above the Oxus iex, near the Palus Mazotic. The learned Bryant is of opinion, that this account is not warranted by sufficient authority on the part of the writers to whom M. Pizon appeals. Although such people as the Cimmerians actually existed upon the Mazotic, yet that they came from Bactria, and fought their way through different countries; and that they were the brethren of the Scythians styled Sac-
es, and took the upper route, when the others were making their inroad below, are circumstanced which, says Bryant (Anal. Mythol. vol. iii. p. 143.), have not the least shadow of evidence. Another writer of our own nation (see Wife's Hist. & Chron. of the Fabulous Ages, p. 149,) supposes, that all sciences centered of old in Bactria, called Bochary, or " the land of books." (See SACE, and SCYTHIA.) But to return from this digression : Eucratides, king of Bactria, was treacherously murdered by his son of the same name, who usurped the throne; but he was expelled by the united forces of the Scythians who attacked him on one side, and of the Parthians who attacked it on the other, and was soon after killed in attempting to recover it. The Greeks, says Strabo (I. xi. p. 779.) were deprived of Bactria by tribes or herds of Scythian Nomades, who came from the country beyond the Iaxartes, and were known by the names of Asii, Paftani, Tachari, and Sacraan. This fact concides with the relation of the Chinefe historians, cited by M. de Guing-
nes (Mem. de litter. t. xxv. Mem. p. 19.), and is confirmed by it. By them we are informed, that about 126 years be-
fore the Christian era, a powerful horde of Tartars, pushed from their native feasts on the confines of China, and obliged to move towards the west by the pressure of a more numer-
ous body that rolled on behind them, killed the Iaxartes, and pouring in upon Bactria, like an irresistible torrent, overwhelmeed that kingdom, and put an end to the dominion of the Greeks there, after it had been established near 130 years. The kings, who reigned in Bactria in the times of the Roman emperors Adrian, Antoninus Pius, and Vale-
rian, were all of Scythian extraction; but the Scythians were in their turn driven out by the Huns, who reigned in Bactria in the time of Ladiulus IV. king of Hun-
gary.

BACTRIANUS, in Zoology, a species of Camelus, having two bunches on the back. Linnaeus.

BACTRIANI, in Geography, a town of Asia, in the country of Georgia. 60 miles north of Tellis.

BACTRIANA, in botany, a species of Camelus, having two bunches on the back. Linnaeus.

BACTRIANUS, in zoology, a species of Camelus, having two bunches on the back. Linnaeus.
the height of about four feet; leaves from deep, few, firm, clasping at the base, pinnate; the rib prickly; the leaflets eniform, acuminate, shining, flat, serrate-prickly; spathes axillary, solitary, fore-draw; continuing long after the fruit is ripe; flowers without scent, very slightly tinged with yellow; fruit the colour and size of a common cherry, containing an acid juice of which the Americans make a root of wine. Canes are made of the stem; they are dark-coloured, firm, jointed, very light, and called by the French Comtes de Toulouse a B. major Jacq., i.e. “fruit ovate.” This resemles the former, but grows to the height of twenty feet with a stem more than two inches in diameter. Leaves six feet long; leaflets nearly two feet, with the marginal prickles brown, and more conspicuous than those in the other species; spadix compressed, flat, reclining; fruit of the form and size of an egg, acuminate with the flake, fibrous, succulent, covered with a dark purle coriaceous coat, of which the natives make a vinous liquor. The nut is large, of a dark colour, ovate-oblong, with an acuminate trifid apex, and three oblique holes, two above the middle, and the third higher; kernel oblong, blunt at both ends, enpiiform, solid. The fruits are called Cassiara, and sold in the market. Both these plants are natives of Carthagea in South America.

BACTRIS, in Entomology, a species of Brachus that lives in the woods of the American prairie. It is chroocic; wing-cases rather smooth; posterior thighs ovate; fancks bicurved. Linn. Amoen. Ac. Grec. &c.

BACTROPERA, also written Bactroperta, composed of Bactris, flag, and pera, bag, or bud: it is an ancient appellation given to Philosphers cov by way of contempt, denoting a man with a flag and a budget.

BAHACH, in Geography, a town of North America, in New N. arr. 135 miles south of Casa Grande.

BACULARES, a kind of Anabaptists, so called, as holding it unlawful to bear a sword, or any other arma besides a staff.

BACULARIS, in Writers of the Middle Ages, an ecclesiastical appurtenant, or verger, who carries a staff, bacula, in his hand, as an ensign of his office.

BACULE, in Jurisprudence, a kind of portcullis, or gate, made of wood, of a fall with a counterpate, and supported by two great flake. It is usually made before the corps du garde advancing near the gate.

BACULLI. See Baculi.

BACULI, Santé Paul, or batons of St. Paul, a kind of figured stones, of the same substance with those resembling the bristles of some American scabir, called by Dr. Pott lapides faulchii.

BACULOMETER, the art of measuring accessible and inaccessible distances, by the help of baculi, flaves or rods. Schwenter has explained this art in his “Geometra Practica,” the rules of its are also laid down by Wohius in his Elements; Oerstem also gives an illustration of the principles of baculometry. See Distance, and Longometry.

BACULOSUS ECCLESIASTICUS, in some Ancient Lawes, is used for a bishop or abbot, dignified with the pastoral staff, or crozier.

BACULUS DIVINORIUS, or Virgula Divina, a branch of hazel-tree, of a forked figure, used for the discovery of mines, springs, &c. See Virgula Divina.

BAD, in Ancient Geography, a town of Africa, according to Orbilius and St. Clement. Also a river of Eleutheria, in the vicinity of the town of Palos, near which was a tomb said to be that of Memnon, son of Titobonus, and nephew of Priam, king of Troy. Strabo, i. xlv.

BADA, or Babus, in Zooloqy. This is the name of the Rhinoceros among the negroes on the coast of Angola.

BADACUM, in Ancient Geography, a town of Iurica, situate near the Danube. Ptolemy.

BADAGIS, in Geography, a town of Kassim, on the southern borders of the ancient deict of Mardianna. N. lat. 25° 25'. E. long. 50° 28'.

BADAGSHAN, or Badakshan, an ancient city of Independent Tartary, in Great Bucharia, laid on the north side of the river Amu, or Harbit, not far to the north of Amudah in Tokareth. In the 15th century, this city belonged to the khan of Great Bucharia, or rather of Samarca, and being surrounded in a branch of the Belar Alps, was used as a slave prison for rivals or insurgents. Badakshan was small, but well built and populous; and its inhabitants were enriched by the gold, silver, and rubies found in its neighbourhood; the grains of gold and silver abounding in the torrents which descend from the mountains, when the snow melts in the beginning of summer. Several Caravans for Little Bucharia and China pass by this city. Ibn Haukal mentions that there were not only mines of rubies and lazulite near Badakshan; but that there was abundance of marble. It is situated about 100 miles from the source of the Amu, 250 from Balk, and 210 from Anghien in the province of Samarcan. N. lat. 36° 15'. E. long. 68° 45'.

BADAGRY, a town of Africa, in the country of Benin.

BADAJOZ, Pax Augusta, a considerable town of Spain, being the capital of Elbemada, and a frontier fortress towards Portugal. It is situated near the river Guadiana, on a gentle rife, which on one side is covered with olive-trees, and on the other side of the river are some fortified hills. Over the river is a handomfe stone bridge, built, as it has been said, by the Romans, but as the interposition on it plates, by Philip II. The streets are clean, and partly straight, and well-paved; and there are a few large houses, with some handsome churches and towers. The fortifications are not very strong; but it has sustained two sieges, one by the Portuguese in 1568, and another by the English and Dutch, aided by the Portuguese, in 1705. N. lat. 38° 43'. W. long. 6° 19.'

BADANATHA, in Ancient Geography, a town of Arabia Felix, in the country of the Thamudes. Pliny.

BADARA, a town of Afiis, in Gerdonia.—Also, a town of Afiis in Caramania.

BADASKA, in Geography, a town of Siberia, on the side of the Angara; 80 miles N.N.W. of Tukushch.

BADATIUM, in Ancient Geography, a town of the Tauric Chersonesus. Ptolemy.

BADUSA, a town of Afiis, in Mesopotamia. Ptolemy.

BADAMMY, in Geography, a town of Hindustan, in the country of the Vifapour, eighty miles south of Vifapour. N. lat. 16° 10'. E. long. 75° 46'.

BADELON, BADALON, or BATULA, an ancient town of Spain, in Caralonia, seated on the coast of the Mediterranea, about six miles north-east of Barcelona. BADELU, or Bardiou, a country of Africa, on the borders of the river Gantha.

BADERNDASIO, a long narrow sandy tract of land in Sweden, in the province of Varmeland, where the Danes were totally defeated in 1527.

BADEN, a district or county of Switzerland, lying on both sides of the river Limmat, and bounded on the west by the river Aur, on the north by the Rhine, and on the south by the Reufs, became a bailiwick of the eight ancient cantons in 1418, when the canton of Zurch took possession of the town and county, and so continued till the year 1712. A civil war breaking out at that time between the Pro-
Protestant and Catholic cantons, Baden was besieged and taken by the troops of Zürich and Bern; and at the peace of Aarau, it was ceded to those two cantons and Glarus, which, on account of its neutrality, preserved its right of joint sovereignty. Until 1716 the diet assembled at Baden; but was afterwards transferred to Freiburg. The three cantons alternately elected a bailiff, who resided in the castle. The inhabitants elected their own magistrates, and had their own judicial courts. In civil proceedings, an appeal lies to the bailiff, and from his decision to the syndicate, composed of the deputies of the three cantons, and in the last resort to the three cantons themselves. In penal causes, the criminal court condemns, and the bailiff enjoys the power of pardoning, or mitigating the sentence. This bailiffage comprehends about 138 square geographical miles, and contains 24,000 persons. In consequence of the French revolution, a new division took place in 1798; the country of Baden, the free bailiffage, and a small portion of the south-western part of Zürich, were constituted one of the 18 Swiss departments or cantons, and Baden was its capital; but according to the constitution of the 25th of May 1801, Argovia, re-united with Baden and with the upper part of the Frickthal, was made one of the 17 departments or cantons of Switzerland; and six representatives were appointed to be deputed by it to the diet. The soil of this district is fertile; in general it abounds with grain and fruit, and on the sides of the Limmatt it produces wine. The mountains yield excellent freestone, marble, and iron ore. The greater number of the inhabitants are Roman Catholics.

Baden, the capital of the above district or canton, is situated on the south of the river Limmatt, in a plain flanked by two hills, between which the river runs. It derived its name and its origin from the warm baths in its neighbourhood, which were famous before the Christian era, and are mentioned by the ancients under the name of Agna and Therna Helvetica. It was a Roman fortress, erected to curb the Alemanni or Germans, and was razed when the Helvetians, who supported Otho, were routed by Caesar, general to Vitellius. Being rebuilt, it was taken by the Germans; fell afterwards under the dominion of the Franks, and was in the tenth century incorporated in the German empire, and became successively subject to the dukes of Züringen, to the counts of Kyburg, and to Rhodolph of Hapibus. When his descendant Frederic, duke of Austria, was put under the ban of the empire, in 1418, it came into the possession of the canton of Zürich, which purchased it of the emperor Sigismund, and subjected it to the eight cantons. (See the preceding article.) Many monuments of antiquity have been found in this place; such as statues of several heathen gods, made of alabaster; Roman coins, formed of bronze, of Augustus, Vespasian, Decius, &c., and several medals of the Roman emperors, of gold, silver, copper, and bronze. There are two churches in this city; one collegiate, and the other a monastery of capuchins, near the town-house, in which the diet formerly assembled. Before the castle, which is the residence of the bailiff, there is a stone-pillar, erected in honour of the emperor Trajan, who paved in this country a road eighty-five Italian miles long. The inhabitants are rigid Roman Catholics, and were formerly inoffensive in their behaviour towards the Protestants. The baths are situated on each side of the river, about a quarter of a league from the city. Adjacent to the small baths is a village, and to the large, a town, seated on a hill of steep ascent. The water of the baths is conveyed to inns and private houses by means of pipes, of which there are about sixty. And in the middle of the towns there are public baths, supplied by a spring in the fleet, where the poor may bathe gratis. All the baths are hot, and they are used for drinking as well as for bathing. They serve, like others of a similar kind, to give relief in a variety of diseases. (See Waters, Medicinal.) About a mile from Baden, at a place called Wettingen, where the Limmatt flows with the greatest rapidity, there is a beautiful piece of mechanism, which is a wooden bridge, 240 feet long, and suspended above twenty feet from the surface of the water. It was the last work of Grubenmann, the self-taught architect, and exceeds in elegance that of Schaffhausen. Mr. Cox (Trav. Swiff. vol. i. 175) has given a geometrical elevation of it. Baden is distant 143/2 miles from Zürich. N. lat. 47° 31'. E. long. 8° 12'.

Baden, a marquessate of Germany, in the circle of Swabia, is divided into the upper and lower marquessate. The upper, or the marquessate of Baden-Baden, terminates westward on the Rhine, though a small part of it lies west of that river, and is bounded on the north-west by the lower marquessate of Baden-Durlach, on the east by the duchy of Wurttemberg and the county of Eberlein, and on the south by the Ortenau and the Brifgau. The principal towns are Rastadt, Baden, Ettlingen, Steinbach, and Stolhoften. The marquessate is a sovereign prince, and has a vote in the college of princes. The established religion is Roman Catholic. The lower marquessate, or that of Baden-Durlach, is bounded on the west by the Rhine, on the south by the upper marquessate of Baden, on the east by the duchy of Wurttemberg, and on the north by the bishopric of Speier. The principal towns are Carlsruhe, Durlach, Pforzheim, Muhlburg, and Emmingen. This prince has two votes in the college of princes, one for Baden-Durlach, and the other for the marquessate of Stockberg, which belongs to him, and lies in and along the Brifgau. The reigning family, and the country in general, profess Lutheranism, with a toleration of Protestants, Catholics, and Jews at Carlshruhe. The whole marquessate of Baden is a populous and fertile country, abounding with corn, hemp, flax, bees-wax, wood, and wine. Venison and wild-fowl are so plentiful that they are the common diet of the peasants. Their hogs, being fed with chestnuts, furnish excellent bacon. They have freestone for building, marble of various colours, and some agate. Manufactures are much encouraged, and the country is in a flourishing condition. The territories of the marquessate of Baden comprehend 832 square miles, and 200,000 inhabitants. The annual revenue is estimated at 1,200,000 florins; and the military establishment consists of 3000 men, of whom 200 are cavalry.

Baden, a town of Germany, and capital of the upper marquessate of Baden, is seated on the river Oalbach near the Rhine, among vineyards. It has a fine castle, on the top of a mountain, where the prince often resides during the summer. It is famous for its hot baths, whence it derives its name: distant four miles south from Rastadt. N. lat. 48° 46'. E. long. 9° 24'.

Baden, a town of Germany, in the archduchy of Austria, seated on the river Schwocha, and much frequented on account of its baths. The town is walled, and has three churches: twelve miles S. S. W. from Vienna. N. lat. 48° 3'. E. long. 16° 12'.

Badenoch, a district forming the eastern part of Inverness-shire, in Scotland, extending from sea to well about thirty-three miles, and in the breadth part twenty-seven miles from north-east to south-west. It is barren and hilly, and abounds with deer and game.

Badens, Francis, in Biography, a painter of history and portraits, was born at Antwerp, in 1571, and acquired the first rudiments of the art from his father; and, by visiting Rome and other parts of Italy, acquired a good taste in
BADENSIS, in Entomology, a species of Cerculio, about the size of C. cerami. It is black; legs pitchy. Genus, Blum. This insect inhabits Germany; the thorax is rather smooth and ovate; wings-cases obliquely eliptic; thin elivated.

BADENSIS, in Ornithology, a species of Emberiza found in the neighbourhood of Baden. The colour is olive, streaked with blackish, beneath paler; cheek orange; breast elivated with blackish. Sander Naturf.

BADENUCHI, in Geography, a town of North America, in the province of New Navarre; 125 miles south of Cafa Grand.

BADENWEILER, a town of Germany, in the circle of Swabia, and margravate of Baden-Baden. N. lat. 47° 55'. E. long. 7° 50'.

BADERA, in Ancient Geography, Baferg, a place of Gaul, belonging to the Volfsce Tectofagos, in the Narbonenesis prima, on the route from Toulouse to Narbonne, and south-east of the city of these towns.

BADESSUS, a town of Asia, placed by Ptolemy in Caria.

BADERY, in Geography, a town of Persia, in the province of Korafl; 140 miles north-west of Herat.

BADGE, in Naval Architecture, signifies a sort of ornament placed on the outside of small ships very near the stern, containing either a window, for the convenience of the cabin, or a representation of it. It is commonly decorated with marine figures, military instruments, or such like emblems.

BADGE, in Heraldry. See Device.

BADGER, in Zoology, ursus miles of Linnaeus and Gmel. See Ursus Melis. The badger's skin is of some use in commerce. Their fat is sold by the druggists, as a remedy against disorders of the kidneys and the sciatica; and their hair, for the making of pencils for painters and gilders.

BADGER, from bajulo, I carry, or from the Fr. bagage, a bundle; whence bagager, a carrier of goods; a licenced huckler, or person privileged to buy corn, or other provisions, and to carry them from one place to another to make profit of them, without being reputed an engrosser. In the statutes he is also called a kildar, or lader of corn, 5 & 6 Ed. VI. c. 14. 5 El. c. 12.—We also read of badgers, or retailers of salt, 9 W. III. c. 6. If any person shall act as a badger without licence, which continues in force one year, he shall forfeit five pounds, one moiety to the king, and the other to the proprietor. 13 Eliz. c. 25. § 20.

BADGER-BY-NIGHT. See Hunting.

BADIA, in Conchology, a species of Cypraea, having an oblong gibbose shell, above bay-colour, dotted with brown and white. Gmelin, &c. Its native place is unknown.

BADIA, a species of Helix, called by Born helix ungulatia; it is about an inch in height, and rather more than an inch and a half in length; and of a chestnut colour. The shell is umbilicated, subgloboso, smooth, depressed above; aperture lunare. Gmelin.

BADIA, a species of Patella, the shell of which is somewhat convex, brown, bay-colour within; with twelve larger rays, each surrounded on both sides by a rib; and smaller rays. The varieties of this kind are numerous, and no less than sixteen of them are described by Schreber. Linne, in Conch. d. Letterat. &c. This shell is usually about two inches and three quarters in length; more or less flat in different specimens, and rarely inflated; sometimes they are dotted with green, but slightly; and in others the upper surface is spotted all over with that colour; shells of this kind occur in which green or brown is disposed in rays, or in rows of dots; sometimes they are palisade-colour, waved or spotted with yellow or brown, or liver-colour. The crown is often variegated with rays, and not uniformly with five rows of blue dots; and the pustulae conical, or a green spot in the bottom, surrounded by a single or double band, which is more or less pale, and of different colours in different shells; the inner surface is usually either brown, yellow, liver-colour, or bay-colour. LINNÉUS makes it a species of Spunge.

BADIAN, or BADIANA, the seed of the anise-tree, or of a tree resembling it, that grows in China; and sometimes used by the Chinese, and also by the Dutch, to give an aromatic taste to their tea.

BADIAH, in Ancient Geography, a town of Africa, in Libya interior.

BADIGEÓN, a mixture of platter and free-flone, well grounded together, and sifted; used by flatuaries to fill up the little holes, and repair the defects in flones, whereasof they make their flatuaries and other work.

The same term is also used by joiners, for saw-dust mixed with strong glue, wherewith they fill up the chaps, and other defects in wood, after it is wrought.

BADILE, Antonio, in Biography, a painter of history and portrait, was born at Verona in 1482, and by affidavit application excelled his predeceivers in an acquaintance with the true principles of his art. He was allowed to be a very eminent artist; and he had the honour of having for his discipes, Paolo Veroeino, and Baptista Zelotti. His colouring was admirable; his carnations beautiful; and his portraits preferred the perfect resemblance of flesh and real life. He died in 1560. Pilkington.

BADILETTES, a name given to a race of horsemen relented in the mountains, in the vicinity of Circilia, and of the Nogai Tartars, who in some measure retain their independence.

BADINGEN, in Geography, a town of Germany, in the
BADY, a river and an ancient place of Peloponnesus, in the territory of Elis, mentioned by Pausanias. After a war which depopulated the country, the women, it is said, prefented their supplications to Minerva, that they might supply the want by a new progeny in conformance of their first intercourse with their husbands; and they erected a temple in honour of the goddess; and hence the name Bady or Badis, Bady, or in the Dorian dialect Avo, i.e. pleasant or agreeable.

BAA, the name of a mountain in the island of Cephalonia.

BA/BEZANA, or BAKKANA, a town of Afa, in Aria.

BÅERO, the name of a town of Spain, mentioned by Pliny.

Species, B. fruticosa, Reich. 2. 200. Obs. It. 231 t. 1.

This shrub has the habit of fotherworm, with wand-like branches, and opposite short simple twigs; leaves opposite, linear, sharp, smooth, entire; flowers axillary, foliary, on a naked peduncle the length of the flower, much shorter than the leaves. A native of China, where it is called Tsin gia.

B. ECOLICUM, or BIAECOLICOS, in Ancient Geography, a mountain of Africa, in the Pentapolis. Ptolemy.

B. EECOR, a place of Spain, in Bettyca, where Viriates wintered after having been defeated by Fabius Maximus Aemilianus. Appian.

B. EECULA, a town of Hifpasia Tarragonensis, in the territory, or at least in the vicinity of the Authetani. Ptolemy.

B. EDOO, in Geography, a district of Africa, to the west of the river Niger, mentioned by Mr. Park in the narrative of his journey.

B. EELAMA (Cloaca Badiana), in Ichthyology, the name of a fish found in the Red Sea, and described by Forsk. P. Arab.—It is eulops feiferisci of Gmelin.

B. EELON, in Ancient Geography, a town of Spain, north-west of Mallaria, upon the shores of Gadis, which carried on a considerable commerce in fall with Tingis, on the opposite shore.

B. AEN, in Geography, a town of European Turkey, in Moldavia, six miles miles N. N. W. of Niemecz.

B. EENUM, in Ancient Geography, a town of Arabia Felix. Ptolemy.

B. EEBOTrys, in Botany, (from Bees, small, and Beesw, a race me; the fructifications being in this race me). Lin. gen. Schreb. 318. Forrier, Gen. 11. Clafa, pentandra monogynia. Gen. Char. Cal. perianth double; exterior three-leaved; leaflets roundish, concave, smaller; inferior one-leaved, bell-shaped, short, five-cleft, growing to the germ; clefts ovate, permanent, converging after flowering, and crowning the fruit. Cor. one-petalled, tubular; tube very short; border five cleft, erect; clefts rounded, very short.
short. Stems, filaments five, very short, in the middle of the tube; anthers heart-shaped. Pal/ a gem globose, half-superior; style cylindrical, very short, permanent; stigma obtuse, tuberculat/ed. Per. berry globose, somewhat dry, coarsely-nerved, growing to the calyx. Seeds several, angular, allined to a columnar receptacle in the bottom of the berry.

B. Zones, *in Cog/169/, the name given by Arr./175/ a to an island in the Indian ocean, on the other side of the river Indus.

B. Auer, and Whi/e B/175/ in *Zoology*, the names of the *black bear*, and *Polar bear*, in "Ridinger's Animals."

B. B/175/RS/175/US, or V/175/kenst/175/H, Henry, in *Biography*, a mathematician, flourished in the beginning of the sixteenth century. He was a printer at Louvain, and the author of the following curious mathematical treatises: "Tabula perpetua Longitudinem ac Latitudinem Planitarum," 1528; "De compositione et ufo Decretariori Planetarum," 1550; "De compositione et ufo Quadraritatis," 1557; More.

B. *Es/175/rat*, a painter of sea-shores, sea-florcs, and fish, was an eminent master, whose works were much esteemed, though the place and time of his nativity are unknown. His pictures are easily distinguished by a general brightness diffused through the whole, and particularly in his lilies. His drawing was correct, and his perspective true; he copied every object from nature, and was exact in his representations of sea-shores, ships of war, and vessels of a smaller size, which he distributed with judgment, so as to produce a very pleasing effect. His pencil is light and clean, his touch spirited, and his colouring always transparent; and he generally finished his pictures very neatly. He died in 1657, F/175/lington.

B. *Es/175/am/175/psa*, a town situated in the Arabian gulf, supposed by some interpreters to be the same with the Beth-Schemau, or the house of the fun, mentioned by Jobu/175/a.

B. *Es/175/ippo*, a town of Spain, situate about twelve miles from Ba/175/lon, and at a somewhat less distance southward from the promontory of Juno. Antonio Itin.

B. *Es/175/tana*, a town of India, on this side the Ganges, situated on the river Nanguna, and said by Ptolemy to be the capital and residence of the Siro pulses.

B. *Et/175/rae, Be/175/ziers*, a town, which was a Roman colony, situate in Narbonensis Prima, a southern province of Gaul, at a small distance northward from Narbo. It was the flation of the seventh legion, who built two temples, one dedicated to Augustus, and another to his daughter Julia. The Tiberians also adorned this city; and in the fourth century it was one of the most considerable in Gaul. But in the fifth century it was taken by the Vifi/175/ goths, who demolished its splendid edifices. It was afterwards re-established; but taken possession of by the Saracens in 736. In the next year Charles expelled them, and destroyed the city, so that they might not be able to re-fortify it.

B. *Es/175/thau/, a town of Asia, in Mesopotamia. Pto/175/lem.

B. *Es/175/tica*, a province comprehending the southern part of Spain, and corresponding to the present Andalusia and Grenada. This was one of the three provinces into which Augustus divided Spain; the other two being Lusitania and Tarracencens. It derived its name from the river Baxis, since called Tartessus, and now Guadalquivir, or the great river; and was bounded on the west side by Lusitania, on the south by the Mediterranean and Gulf of Cadiz, and on the north by the Centralic sea, now the sea of Biscay. Its limits towards the north-east were fluctuating, and cannot be easily ascertained. The Baxis divided this province into two parts; on the one side of which, towards the Andes, were situated the Tartanisi, whence the kingdom was called Tartessos, but it was better known by the name of Bactria. On the other side were situated the Baffuli, Baisitani, and Costellani, along the Mediterranean coasts. It was the richest and the best known province of Spain. It was famous for its wool; and its fertility was such, that its produce, according to Pliney, (i. xviii, c. 10), was an hundred fold. It is well known that the Phoenicians were long ago established on these coasts, and that the Carthaginians had settlements in this country. Ptolomies speaks in high terms of the wealth of Bactia, and of the magnificence of the court of one of its sovereigns.

B. *Es/175/tia*, now Guadalquivir, a river of Spain, in Bactia, which had its source, according to Pliney, in the mountains called Saltus Fugiens; or to the north-east of Orosplada, pursu'd its course towards the west, washing Corduba, Corduba, and Hifpalis, and discharging itself by many outlets or mouths into the sea. The inhabitants of the country called it Citium and Ceritis, and the Arabs Ciritis, derived, according to Mariana, from the oriental term kirhis, a town, and denoting the river of towns, on account of the number of those which it watered. See Guadalquivir.

B. *Es/175/tium*, the name of a town of Macedonia.

B. *Es/175/tius*, a river of Arabia Felix.—Also, a mountain of Asia, in Drangiana. Ptolemy.

B. *Es/175/tulo*, a town of Spain, belonging to the Lusitani, at a small distance south-west from Bescino; now Badelona.

B. *Es/175/uria*. See Bactia.

B. *Es/175/us*, in *Ich/175/eology*, a name given by Aris/175/tote and other of the ancient Greeks, to the fish called by some Latin writers cottius; and particularly to one kind supposed to be that described by Linnaeus under the name of gobio; and called the bull-headed, or miller's thumb, in England.

B. *Es/175/yleis*, or *B/175/tis/175/on*, in *Antiquity*, a kind of stones worshipped among the Greeks, Phrygians, and other nations of the East; supposed by some modern naturalists to be the fame with our ceramia, or thunder-stone.

The priests of Cybele called a batylos on their breast, representing the mother of the gods.

According to Dama/175/iscus, cited by Photius, they had many of these batylas, which were consecrated to different gods, as Saturn, Jupiter, the sun, &c. Bochart (Chanaan, i. ii. c. 2, vol. i. p. 708.) derives the origin of this superstitious practice from the stone which Jacob erected at Bethel. Whenever the practice was deduced, it was very extensive and prevalent; for in the eastern countries no idol was more common than oblong stones, which were denominated by the Greeks to/175/ri/175/a, pillars. In some parts of Egypt, they were planted on both sides of their roads. In the temple of Heligabalus, in Syria, there was one which they pretended
pretended to have fallen from heaven: and a black stone of this kind was fetched from Phrygia, with great ceremony, together with the priests that belonged to it, by a Roman embassy, at the head of which was Scipio Nafica.

BAZA, in Geography, a town of Spain, in the province of Andalusia, and country of Jaen, seated on a high hill three miles from the river Guadalquivir. It was anciently the seat of a bishop, which was removed to Jaen in 1249, and a kind of univercity founded by John d'Avila. It was taken by the Moors about the end of the fifteenth century. N. lat. 37° 45'. E. long. 3° 15'.

BAZA, a town of South America, the capital of the government of Quixos, in the province of Quito, in Peru, was founded by Gil Razon D'Avamos in the year 1559. Baza, though the first built town in this country, has remained very small, which is owing to the building of the two cities of Avila, and Archidona, which became the chief objects of the attention of the settlers. But these places have not increased to the title of cities, which was given them, when they were founded; because the country is much inferior to Quito with regard to its air and fertility, and the other enjoyments of life. Baza is much declined, and confisits only of eight or nine thatched houses, with about twenty inhabitants of all ages; so that from being the capital as it once was, it is now annexed to the parish of Papallacta, in which town resides the priest, who has also under his care another town called Mailpu. This decay was the unavoidable consequence of the removal of the governor, who has of late relived at Archidana. See Quixos.

BAZILLO, a town of Spain, in Old Castile, three leagues from Valladolid.

BAFETAS, or BAFAS, a cloth made entirely of coarse white cotton thread, which comes from the East Indies. Thes of Sarat are the best.

BAFFA, or Boro, in Geography, a neat village of Africa, on the Grain coast, about a mile east of Sanguin; which supplies ships with ivory and pepper. It is easily distinguished by a long sandy point, surrounded with rocks, that project into the sea. The language spoken in this place is a kind of corrupt Portuguese, or rather a mixed language.

BAFFA, Cape, is the south-west point of the island of Cyprus in the Mediterranean, in N. lat. 34° 37'. E. long. 32° 18'. Near this harbour stood the ancient Pathos, where was a temple consecrated to Venus (see Paphos), it is now succeeded by ruins, a village, a mean cottage, and equally mean houses, and a few Greek churches of the same description, and the name Paphos is converted into Baffa or Bafion. In the rocks is found a very fine rock-crystal, which is called the Baffa diamond, because it is procured from the environs of Baffa.

BAFFIN'S BAY, is the largest gulf or bay of North America, and was called from William Baffin, who, accompanied by captain Robert Bylot, attempted, in 1616, to find a passage through Davis's straits. In a large lense it extends nearly north and north-west from Cape Farewell in West Greenland, as far as Whale found, passing through the part of it called Davis's straits, and reaches from the parallel of 60° to that of 80° N. lat. In a more confined lense it comprehend from 70° to 80°, being bounded on the north by the Arctic continent or lands approaching towards the north pole, on the east by Greenland, on the south by Davis's straits, the ocean, and several islands which lie between this gulf and Hudson's bay, and on the west by a part of North America. Baffin seems to have restricted this appellation to the sea between 72° and 78° N. lat. and says that he traded with the Greenlanders at Horn found, in the seventy-third degree, but in the seventy-fourth degree he found no natives, but several plains where tents had been set up, from which he concluded, that at certain seasons of the summer people resided there. The sea was full of seals and unicorn fish; and in sir Thomas Smith's found, in the seventy-eighth degree, he found the largest whales. See Grantz's Hill of Greenland, vol. i. p. 16. In our maps it opens into the Atlantic ocean through Baffin's and Davis's straits, between the broken land on the American coast, and that west of New Greenland, and between Cape Chidley on the Labrador coast and Cape Farewell on that of West Greenland; and on the south-west of Davis's straits it has a communication with Hudson's bay, through a cluster of islands. Some maps show a communication with Hudson's bay, in the seventy degree of N. lat. and in the 70th of W. long. Baffin's bay is laid down as extending from 46 W. long. to 94°, which allowing only sixte, a geographical miles for the degree, would give a length of 768 geographical miles; and the breadth on the west side is represented as little inferior. But the extent and limits of this sea have not yet been accurately ascertained: nor has the west coast of Greenland been explored beyond N. lat. 72° or Sanderton's Hope, and an old Danish settlement called Opperier. In the midst of Baffin's bay many maps present a large tract called James island, which some have imagined to be a promontory passing from Greenland; or it is probably a large isle in the north of Hudson sea, laid down from erroneous observations. This bay has been sometimes called Bylot's bay.

Baffin's Strait is a passage between James island and the most easterly of Cumberland islands, from the gulf of the ocean into Baffin's bay. This, and Davis's strait on the east of James island, and Cumberland strait on the south-west between the Cumberland islands, seem to shew that the proper boundary of Baffin's bay does not reach so far south as to cape Farewell.

BAFING, or Black River, a principal branch of the Senegal river in Africa. Mr. Park, in his Travels in the Interior Districts of Africa, describes a singular bridge erected by the Follonkas over this river. It consists of two tall trees, which were tied together by the tops, reach from one side of the river to the other; the roots reposing upon the rocks, and the trees floating in the water. When a few trees have been placed in this manner, they are covered with dry bamboo, so as to form a floating bridge, with a floping gangway at each end, where the trees rest upon the rocks. In the rainy season this bridge is carried away by the swelling of the river.

BAFVENLAKE lies in that part of Sweden called Sodermanland: it is extensive, and contains many islands.

BAG, in Commerce, a term used to signify different quantities of certain commodities: a bag of almonds, for instance, is about 3 cwt.; of aniseed, from 3 to 4 cwt.; of pepper, from 14 to 3 cwt.; of goats-hair, from 2 to 4 cwt.; of cotton-yarn, from 24 to 41 cwt. &c.

BAG, in Medicine and Pharmacy, denotes a kind of fomentation, prepared of proper ingredients, included in a bag, to be applied externally to a part disfigured for pretent relief. Diaphoretic writers describe cordial bags, used in delirious; bags for the side, for the stomac, in weaknesses of the stomach; mercuric bags to ease pain in any part. Wines and ale are frequently medicated by putting into them bags full of proper ingredients.

Sweat bags are compositions of perfumes, scented powders, and the like, included in bags, to give a fragrancy to clothes, &c.

BAG, in Purfury. See CHEWING-BALLS.
BAG

Baguio. See Oil.

Baguio, Sandy. See Sand.

Bag, or Bay of Points, in Geography, is a noted promontory among islets on the north coast of Divon, at the north-west point of the entrance into Barnafilip bay. N. lat. 52° 50' W. long. 4° 32'.

Bagh, in Ancient Geography, a town of Africa Propria, being one of those which were re-established by the emperor Julian, according to Procopius.

Bagh, or Bagh, a town of Afia, in Pithia.

Bagadania, a large plain of Afia, in Cappadocia, placed by Strabo between mount Taurus and mount Arge, about 3000 flads more fouthward than the Euxine sea.

Bagadai, a name by which there call the carrier pigeon, the columba tadelis of Moors. This name is probably a corruption of the word Bagheta, the name of a city from whence they are sometimes brought to Europe; being originally brought thither from Bagheta.

Bagaduca Point, in Geography, a headland of America, within Penobscot bay, in the district of Maine.

Bagagnana, in Ancient Geography, a mountain of Afia, in Armenia, where they obtained, according to the ancient physician Atius, the Armenian rose.

Bagan, in Geography, a town of Servia, twenty miles north from Nissa.

Baganza, a river of Italy, which joins the river Parma, at the city of Parma.

Baganzola, a town of Italy, in the duchy of Parma, four miles north of Parma.—Alta, another town in the same duchy four miles south of Parma.

Bagaraca, in Ancient Geography, a town of Thrace, Anton. Itin.

Bagard, Charles, in Biography, born at Nanci, in Jan. 1696, was early initiated into the practice of physic by his father Anthony, who had acquired considerable reputation in that art. To the influence our physician had with Stanislaus the first titular king of Poland, and duke of Lorraine, we are indebted for the botanic garden and the college of medicine at Nanci, of which he was the first president. He died of apoplexy in December 1772. Besides numerous dissertations on medical and philosophical subjects, we have the following, by this author:—"Difcours sur l'histoire de la Thérapeutique," published 1755; "Difpensatoire Pharmac. Chymicus," Paris, 1771, fol.; "Linne Medicinalis," &c. 1771, 8vo. "Difcours fur les médicaments de Nanci, 1760, 8vo. Elyot. Diction. H. A. Haller, Biblioth. Botan.

Bagarda, in Ancient Geography, a town of Afia, in Parapamisus. Prolemny.

Bagase, a town of Africa, in Libya Interior, Prolemny.

Bagasis, Bagas, a town of Africa, situated on a river at the foot and to the east of mount Audus.

Bagat, in Geography, a town of France, one league west from Paris.

Bagathusa, Cafse, lies on the coast near coast of Arabia, fifteen leagues east from Shahar. Under the lee of this cape there is good anchorage; but the sea rages on this coast from April to July to such a degree that no ship can live in it.

Bagatins, or Couriers, a name given to the pigme-carriers.

Bagauda, or Bacauda, in History, an ancient faction of pedants, or malecontents, who ravaged Gaul, and assumed the name bagauda, which, according to some authors, signifies, in the Gallic language, forced rebels; according to others, tribute; according to others, robbers; which last signification others allow the word had, but then it was only after the time of the bagauda, and doubtless took its rise from them. Du-Cange.

The bagaudas were a rustic troop of plowmen and shepherds, who, the generous weight of their taxes induced to take up arms under the reign of Claudius II., about A.D. 270, in order to rid themselves of a tyranny which seemed to them worse than death. Irivated by oppression, they renmbled by their ravages the fury of the barbarians, and laid waste the countries which they ought to have cultivated. At this time their strength must have been considerable, as they held a siege of several months to the city of Autun, and at length took it by force. Under Aurelian and Probus no mention of them occurs, because it is probable that the valor and activity of these warlike princes kept them in awe. But under the reign of Diocletian, about the year 286, exasperated by the injustice, violence, and cruelty of Curianus, they renewed their revolt, and they were commanded by two men, whose names were Eliamus and Ananias, each of whom had the holdness to assume the title of Augustus. Maximian, who was admitted by Diocletian as a colleague in the government, A.D. 286, subdued the bagauda partly by clemency and partly by force. It does not appear what became of the two chiefs of the rebels; but Salvianus informs us, that the name and the faction of the bagauda were revived in the fifth century. Crevier's Hist. Emp. vol. ix. p. 282.

Bagauze, is the same name which is given, in the Antilles islands, to the sugar-canes after they have passed through the mill. They are dried, and used for boiling the sugar.

Bagdad, in Geography, a large and populous city of Asiatic Turkey, in that division of Diarbirk called Irak-Arabi, is seated on the eastern banks of the Tigris, N. lat. 33° 22'. E. long. 44° 21'. It has been erroneously supputed by several geographers to be the old Babylon, though it be at a distance from the ruins of this ancient metropolis. It is computed to be about 15000 paces in length, 7 or 8000 yards in breadth, and 30000 in circumference. Mr. Jackman, in his "Journey from India to England," in 1757, says, that it extends three miles along the eastern bank of the river; and the length of the walls from the river being about two miles, it has the form of an oblong square. Its walls are all of brick, with terraces and large towers at proper distances, in form of bastions, and defended by about 60 pieces of cannon. The callest is large, and flanked by some small towers with cannon; and the garrison usually consists of 500 foot, 4200 horse, and 60 gunners. The number of inhabitants, if we may credit the accounts of the Arabian writers, was formerly very considerable; but it is now reduced to fifteen or twenty thousand, including those who live in a suburb on the other side of the Tigris, at the end of the bridge of boats, which are separated every night to prevent surplice. But notwithstanding this number of inhabitants, the town has still many empty spaces within its walls, and it is for the most part but indifferently built. Many of the public buildings, however, such as the mosques, minarets, and hammums, are constructed of hewn stone, and make a very handsome appearance. Here is also an extensive bazar, which is well supplied with a variety of articles. Several of these buildings are arched, in order to guard against the excessive heat of the sun; and as scorpions, tarantulas, and other noxious insects, are numerous, peregrina, in order to avoid them. In the summer season, sleep on the tops of their houles. The environs of Bagdad to the well
of the known world. Among the students there were 300 who devoted themselves entirely to the study of the Mahometan law, according to the decisions of the four chief sects of the Sunnites, each of which sects had a professor in this college. For several ages Bagdad, besides being the seat of power, abounded more with learned men than any other place in the Mahometan dominions, except Mecca and Medina. It was also extremely populous, and contained several forts and castles, capable of making a tolerable defence, and deriving their respective names from their founders. The language spoken in this city was one of the most polite and elegant dialects of the Arabic, as there was a greater concourse of nobility and learned men, who excelled in many branches of literature, for several ages, in this city than in almost any other of the east. The city had also a mint, in which were coined a great number of dirhems and dinars. Bagdad continued to be the seat of the caliphs of the race of Al Abbas for 520 years; but at length, in the year of the Hegira 675, A.D. 1278, the conquest of Iran, or Persia, was achieved by Holagou Khan, the grandson of Zingis, the brother and lieutenant of the two suaveceive emperors Mangou and Cubbi. After a siege of two months, it was stormed and sacked by the Moguls; and their savage commander pronounced the death of the caliph Moltamaf, the blit of the temporal successors of Mahomet; and thus the family of the Abassides was extinguished. The Tartars of Mogul having plundered and set fire on, and mafacred many of the inhabitants, enriched themselves by its spoil, as it was then reckoned one of the most considerable cities in the world; and they retained possession of it till the year of the Hegira 795, A.D. 1392, when it was taken by Tamerlane, for the first time, from sultan Ahmed, the son of Avis, who converted his baggage beyond the Tigris, and abandoned the capital to the conqueror; and it was taken a second time in the year of the Hegira 803, A.D. 1400, from the same sultan, who had recovered possession of it. After this capture, it was restored by Tamerlane to the sultan; but in the year 815, A.D. 1412, the sultan was finally expelled by the Turecoman Kara Jofef. The descendants and successors of Tamerlane remained masters of Bagdad till the year of the Hegira 875, A.D. 1470, when they were expelled by Hafian, surnamed Uzun, or Ufun-Caftan. The princes of this family posseffed it till the year of the Hegira 914, A.D. 1508, when Shah Ismael, surnamed Sofi, the first prince of that race which afterwards reigned in Persia, made himself master of it. From that time it was an object of controll in the wars between the Persians and the Turks, for 100 years. The Turks took it under sultan Soliman, and the Persians retook it under Shah Abbas the Great, king of Persia; but being at length befieged by a formidable army under Amurath III. it was surrendered to him by Shah Sofi, king of Persia, A.D. 1653; and from this time it has remained in the possession of the Turks. Heredot Bib. Or. p. 154. From this disaffurts period the trade of the place has considerabily decayed, as the sultan rilfed all the rich merchants. However, though it groans at present under the Turkish yoke, Bagdad is a celebrated emporium and frontier of the Ottoman empire, on the fide of Persia, to which not only many merchants, but likewise an incredible number of passengers, travelling from Natolia, Syria, Palestine, and Egypt, into Persia, continually resort. Its situation on the banks of the Tigris renders it convenient for trade; but the heat of the climate is so excessive, that the inhabitants are obliged to keep their markets in the night during the summer; and to keep, as we have already said,
on their terraces. The military government is under a pacha or baitha, who ues various deductive methods to extort money from the inhabitants, and particularly from the Jews and Christians, who are the principal merchants of the city, and who have been in a great measure driven from it by the oppression they have suffered. The civil administration is exercised by a cadi, who acts as judge, presiding, and mufti, with a teftedar or treasurer under him, who collects the revenue of the grand signor. The pilgrims that visit Mecca by land are obliged to pass through Badgad, and every one of them pays a tribute or toll, equivalent to four paltries, to the baihkan, which branch of the revenue yields annually a considerable sum to the grand signor. The revenues are computed at 125 lacks of paltries, amounting to about 1,500,000, per annum; but of these, not more than one quarter are collected, by reason of the indolence of the Turks. As the baitha lives in all the splendid of a sovereign prince, and maintains a very large army, he has recourse to great injustice and oppression, in order to obtain the necessary supply. The inhabitants of this city are chiefly Persians, Armenians, Turks, Arabs, and Jews; and of these the latter act as schiffs, or bankers, to the merchants. The Jews, notwithstanding the severity with which they are treated, are induced to live here from a reverence to the prophet Ezekiel, whose mandate they pretend is a day's journey from the city. Many of them likewise annually resort hither from other parts to visit the prophet's tomb. Two chapels are allowed for those of the Romish and Greek persuasion. In this city there are several beautiful mosques, into which Christians are not suffered to enter, for fear of their being defiled. The Mahometan women are very richly drest, wearing bracelets on their arms and jewels in their ears. The Arabic women wear rings in the partition between their nostrils, which are bored for this purpose.

The ruins of ancient Babylon are frantant about fifteen leagues to the south of Bagdad. See BABYLON.

BAGGEDIN, MAHOMET, in Biography, an Arabian mathematician, lived in the tenth century; and is reported to be the author of several treatises in geometry, among which is one "On the division of superficies," translated into Latin by John Dee of London, and by Frederic Commandini of Urbino, who published this treatise at Pefaro in 1570. Some have supposed that Baggedin was merely the translator of this work from Greek into Arabic, and that it was written by Euclid, or some other ancient mathematician. Moreri.

BAGENBON HEAD, in Geography, a cape of Ireland, in the Atlantic ocean, on the coast of Wexford. N. lat. 52° 9'. W. long. 6° 48'.

BAGGAGE, is particularly used, in the Military Arts, for the necessaries, utensils, apparel, &c. of the officers and soldiers. The baggage includes also women, children, sutlers, &c.

The baggage is well called by the Roman writers, impenos, an account of the great trouble and expense attending it. Unles strict discipline be kept, great inconveniences may arise from it; whence several military laws and ordinances relating to the baggage.

The baggage-wagons, before a march, are appointed a rendezvous, where they are marshalled by the waggon-master-general, according to the rank the several regiments bear in the army. On a march, they are sometimes ordered to follow the respective columns of the army, sometimes to follow the march of the artillery, and sometimes to make a column of their own. The general's baggage is generally first. If the army march from the right, the baggage of that wing has the van; if from the left, the baggage of the left has the van. Each waggon has a distinguishing flag, to shew to what regiment it belongs.

BAGGAGE, Packing up the, was a term among the Romans, for preparing to go to war, or to be ready for an expedition.

The formula by which the soldiers declared they were in readiness, was "Bagge conclamare.

The Romans distinguished two kinds of baggage, a greater and lesser: the former was carried by the soldier on his back, and called farina; confiding of the things most necessary to life, and which he could not do without. Hence colligere farinam, packing up the baggage, is used for decamping, capitare. The greater and heavier was carried on horses and vehicles, and called enera. Hence enera vehiculum, farina buvim. The baggage-horses were denominated figurantibus equi.

The Roman soldiers in their marches were heavy laden, inasmuch that they were called, by way of jest, muli, martini, and aruma. They had four sorts of luggage, which they never went without, viz. corn, or batteriam, utensils, vallum, and arms. Cicero observes, that they used to carry with them above half a month's provisions; and we have instances in Livy, where they carried provisions for one whole month. Their utensils comprehended those proper for gathering fuel, dresting their meat, and even for fortification, or intrenchment; and what is more, a chain for binding captives.

For arms, the foot carried a spear, shield, bow, battle, rutrum, lanceet, horn, falx, &c. Also flaves or pales, wall, for the sudden fortifying a camp; sometimes seven, or even twelve of these pales were carried by each man, though generally, as Polybius tells us, only three or four. On the Trajan column we see soldiers represented with this fardle of corn, utensils, pales, &c. gathered into a bundle, and laid on their shoulders.

Thus inured to labour, they grew strong, and able to undergo any fatigue in battle; the greatest part of which never tired them, or put them out of breath. In after-times, when discipline declined, this luggage was thrown on carriages, and porters' shoulders.

The Macedonians were not less inured to hardship than the Romans; when Philip first formed an army, he forbid all use of carriages; yet with all their load, they would march in a summer's day, twenty miles in military rank.

BAGGER, JOHN, in Biography, a Danish divine, and bishop of Copenhagen, was born at Lunden in 1646. After prosecuting his studies under the abbeys in Germany, the Netherlands, and England, he settled in his native place, and was appointed professor of the oriental languages. At the age of twenty-nine years, he was advanced to the episcopal See of Copenhagen, and discharged the duties of his office with distinguished approbation. He revised the ritual of public worship established by Christifian IV., and published several learned and eloquent discourses in Latin and Danish. He died at the early age of forty-seven. A logical treatise of Bagger, under the title of "De principiis perfectivs Synagogi," was printed in 4to. at Copenhagen in 1665. Moreri.

BAGGING of Hops. See Hops.

BAGHYRETTY, in Geography, a river of India, supported by major Renell, to be the true head of the Ganges, which joins the Aixamandra river, the former proceeding from the north, and the latter from the north-east, at Dairag, or the middle Gangoutra, i.e. the fall or cascade of the Gand, or Ganges, at a few miles distance below Sirigaur; and then they form the proper Ganges of Hindooflan, which after-
afterwards fishes through mount Sewalick, at Hardwar, the lower Ganges. Of those two streams Alakehunda is the largest; and at Sirmour, fented on its banks, being confined in a channel 100 yards wide, it runs with astonishing rapidity, and is crost by means of rope bridges of singular contrivance. This river has its source in the snowy mountains of Tribet; and it is probably the same river which Du Halde mentions under the name of Manchou. The Baghyretty river has its source far more remote; but the direction of its course above the upper Ganges is unknown. According to the information of Mr. Dabul, the Baghyretty river separates, at a considerable distance below the Cow's mouth, into two branches; the smallest of which is said to be the Alakehunda. But this depends upon a vague report of travellers, which, lays major Rennell, cannot be depended upon. Rennell's Memoir, p. 371.

BAGIA, in Ancient Geography, a promontory of Carmania, near which was a rock consecrated to the Sun. Ptolemy.

BAGIA, in Geography, a town of Persia, in the province of Farshitan. 120 miles north-east of Shiras.

BAGIENNA, in Ancient Geography, a town of Asia, in Armenia Major. Ptolemy.

BAGIEU, Jacques, in Biography, surgeon to a regiment of cavalry, in the middle of the last century, and author of several valuable works on chirurgical subjects, particularly on the method of treating gun-shot wounds. He opposes the frequent amputation of limbs, so common in France, and reduces the cafes, rendering that operation necessary, to a very small number. He defends experience, as more valuable than theory; no course of reading, or study, being competent to supply the place of practice, the light or knowledge obtained from which is often incommunicable. He commends Amb. Parey's practice in gun-shot wounds, of first using emollient applications, and then making large openings for discharging the confined matter. He does not admit the efficacy of the Peruvian bark in checking the progres of gangrene, which he thinks has its boundaries affixed by nature. He is suppos'd, by Portal, to be the author of "Lettre de M. Chirurgien de Province, a M. Chirurgien de Paris," 8vo. 1730.—Alfo, "Deux Lettres d'un Chirurgien de l'Armee, l'une fur plufieurs chapitres du tr. de la gangrene de M. Queffin, l'autre fur le tr. des armes a feu, de M. Defportes," Paris, 1750, 12mo. "Nouvelle Lettre de M. Bagieu, &c." 1751, 12mo. "Examen du Plufieurs parties de la Chirurgie, &c." 2 vol. 1756. Haller Bib. Chirurg.

BAGISARA, in Ancient Geography, a port of Carmania. Arrian.

BAGISTANA, a town of Asia, in Upper Media, at the foot of the mountains in which are the sources of the river Gyndes; south-west of Ecbatana.

BAGISTANUS, a mountain of Asia, between Babylonia and Media, consecrated to Jupiter. Diód. Sicul.

BAGITAN, in Geography, a town of Persia, in the province of Segellana, 110 miles north of Zorang.

BAGIURA, a town of Egypt, twenty-five miles south of Glege.

BAGLAECUTE, in Ornithology, the name of Gmelin's cousinus philippina, var. B, in Buffon's history of birds.

BAGLANA, or BLAGANEH, in Geography, a province of the Mogul empire, in the peninsula of India, encompassed by Guzerat, Dowlatabad, and Caufeld. It is included within a ridge of the Gats, and is exceedingly mountainous, but contains also many fertile and pleasant tracts. Few countries possess greater advantages, with regard to natural strength; and these are augmented by no fewer than nine strong fortresses, seated on the summits of rocks, of which Salheir and Muhir are accounted impregnable. According to Abdul Hummed, Baglana extended from the sea-coast near Surat, which was its western boundary, to the borders of Dowlatabad (or Aurungabad) eastward; being in length 100 common coffes, and in breadth, from Naderbar and Suttapour on the north, to Nussuck Trimbuick on the south, 70 coffes. Shahnavaz, though he agrees with Abdul Hummed, with respect to the length, allows about 30 for the breadth; and major Rennell says, that it certainly is not 70 coffes, and yet much more than 30, in distance between the alligned limits on the north and south. It has owed its independence, not merely to its natural strength, but to the aid of its rajahs, who courted the princes of the kingdoms of Guzerat, Dowlatabad, and Candesh, by which it was surrounded. Whenever the conquest of it was attempted by any one of these princes, the other two armed in its defence. When the surrounding kingdoms successively fell under the Mogul power, the rajah, for the first time, acknowledged a superior, and visited the court of Achar. But even then the Moguls contented themselves merely with a tribute, until the rapid progress of Aureng-Zeb's conquests and power in the Deccan. Its revenue, previously to the Mogul conquest, was about 80,000l. Rennell's Mem. p. 270.

BAGLIONE, Costanza, in Biography, a most pleasing finger, and excellent actress, in the commedia at Milan, in 1770, at the head of a Bolognese musical family, of which six sisters were all actresses, doubling the number of our Abrames', but not the merit. Three of these sisters went afterwards to Paris, "who pleased there so much (says M. La Borde), as to make us wish to hear the rest." Eliafue la Musique.

BAGLIVI, George, born, Haller says, in Ragusa, a city in Dalmatin, in the year 1668, applied himself early to the study of medicine. After attending the lectures of the professors at Naples and at Padua, at which latter place he graduated, to improve himself further, he travelled over Italy, and settling at length at Rome, viz. in 1692, was advanced to the chair of professor of the theory of medicine and of anatomy, by pope Innocent XII. to whom he dedicated his first work, " De Praxi Medica, ad prificentiam observanda" lib. i. printed in 1696, 8vo.

In this work the author laments the degraded state of medicine in his time, which he attributes to the neglect of observation and experiment, and of the study of the writings of the ancient Greek physicians, particularly of Hippocrates, joined to an inordinate passion for speculative reasoning. He acknowledges, however, the improvements that had been made in anatomy and phylology, and that the theory of the moderns, founded on these improvements, far excelled the hypothetical reasoning of the ancients; and thence conjectures, that when we shall sedulously bend our minds to practical observations, we shall as far excels the ancients in our knowledge of the true method of treating diseases, as we then excelled them in theory.

Examining the question, whether theory or practice conduces most to a knowledge of the method of curing diseases, he determines in favour of practice, but recommends both; "Quaeque curarum," he says (Opera omnia, 4to. p. 127.), "de medicina meditatus quae, pro veris non habetas, nullius ad hygiam praxeis sapientem revocaverit; quae si repetita experimenta nuberis veris, pro veris semen habeat. De bono, aut malo viso, judicaret non poterit, nihil sibi peritum; perfectus medicus non curat, nil cecinert; nec miles flamineus, nil bella gefeller." Bogli is accused of plagiarism, and of

fias, and to the young Sicilian shepherd Daphnis, who first composed pastoral poems.

An anonymous French author has published a treatise of the bagpipe, "Traité de la Mufette," with a new method of learning to play on it without a master. Fol Par. 1672.

Bagpipe the Mizen, in Sea Language, is to lay it aback, by bringing the sheath to the mizen-tillers. BAGRADA, or BAGADA, now Mijera, in Ancient Geography, a river of Africa Propria, the source of which Ptolemy fixes in mount Mampharus, erroneously representing its course to have been from north to south; whereas it flows in a direction from west to east. It is equal, says Dr. Shaw (Travels, p. 77.), to the Isis united with the Cherwell, and continues winding, through its whole course, along a rich and fertile country, with the soil of which it becomes so well saturated, that it is of the fame colour with the Nile, and has the fame property of making encroachments on the sea. To this circumstance may be ascribed the many changes which appear to have been made at one time or other in the channel of it; and to this also it is owing that an open creek of the sea, into which the Mejirda about a century ago discharged itself, is now circumcircled by the mud, and become a large navigable pond, the anti-harbour, as Dr. Shaw calls it, to port Farina. The situation of Utica and of Cartaghis, with respect to this river, are materially altered. (See Cartagine, and Utica.) Bochart (I. i. c. 24.) deduces the name Bagrada, from ἐν θάλασσα, a pond, agreeably to the description of Silius Italicus, l.v. i. 127. -

"Turbidis arenentis lento pede sulcat harenas
Bagrada, nonullo Libycis in finibus amne
Victus limosus extendere latius undas,
Et fla-gante vado patulos involvere campos."

BAGRADAS, a river which flowed on the confines of Peria and Carmania, and discharged itself into the Perian gulf. Ptolemy.

BAGRE, in Ichthyology, a species of Silurus that inhabits South America. The posterior dorsal fin is fat or fleshy; first ray of the dorsal and pectoral fin fetaeous; beards four. Gmel.

BAG-REEF, in Sea Language, denotes a fourth or lower reef of sail, sometimes used in the royal navy.

BAGSZEILAR, in Geography, a town of European Turkey, in the province of Baghria, 20 miles north of Ternova.

BAGUETTE, in Architecture, a little round moulding, less than an astragal; sometimes carved and enriched with foliages, pearls, ribbands, laurels, &c. According to M. J. C. Clerc, when the baguette is enriched with ornaments, it changes its name, and is called chaplet; and unornamented, it is a fous.

BAHAMA ISLANDS, in Geography, a name commonly applied by the English geographers to that cluster of small islands, reefs, and rocks of sand, which stretch in a north-westly direction for the space of near 300 leagues from the northern coast of Hispaniola to the Bahama island, opposite to the Florida shore; or from about 20° to 28° N. lat. and from about 70° to 85° W. long. This whole group is called by the Spaniards Lucayos. The island of Bahama, which gives name to the reef, N. lat. 26° 43'. W. long. 78° 35', is about 25 leagues distant from the continent of Florida; it is about 50 miles long, and scarcely any where 16 broad. The number of these islands is said to be about 50; of which, however, some are merely rocks. Though their number is considerable, and some of them are of a large size, our knowledge of them is very imperfect. They were first discovered by Columbus, A.D. 1492; and the first land he discovered was that of Guanahani, on which he landed to return thanks for his successes, and to erect a cross; and he denominated the island San Salvador, taking poiffeion of it in the name of his Catholic majesty. This island, in the vicinity of Providence island, is known to the English navigators by the name of Cat island. Columbus, however, made no settlement in these islands. About the year 1639, it is said (see Anderson's Comm. vol. ii. p. 37.), the English began to plant on the island of Providence, which till then was uninhabited; and after the conclusion of peace with Spain, King Charles 1. renewed his grant of this and the other Bahama islands. In the year 1666, captain Sayle, an Englishman, was forced in his passage to Carolina, by fires of weather, to land upon one of these islands; and, upon his return to England, he made so favourable a report of them, that six of the proprietaries of Carolina solicited, and obtained a grant of them. Captain Sayle, in a second visit to the island of Providence, which was one of them, discovered the advantage which England might derive from it; and he made the government of England so sensible of it, that about the year 1672 they sent thither a governor and a colony. But the settlement was disturbed by Spanish pirates; and the island of Providence, and the other Bahamas, were abandoned. The chief town of Providence, called Nassau, consisted at this time of 150 houses. The island afterwards became a nest of pirates, who interrupted the American navigation; and on this account, an order was given by his majesty king George 1. on the conclusion of a peace with Spain, in 1721, to fortify and settle the island, and to dislodge these outlaws. The English in the Bahama islands have been computed at three or four thousand; half being settled in Providence, where is the fort called Nassau; and a small harbour. But the natural barenness of the soil, and the narrow length of these islands, which exposes them to the heat and to the winds, account for their comparative insignificance in this grand commercial archipelago. Of their present state, little satisfactory information has been obtained even by the lords of the committee of council for the affairs of trade and plantations. To the inquiries of their lordships in 1789, as to the extent of territory in these islands, the quantity of land in cultivation, the number of white inhabitants, productions, and exports, &c., the only answer that could be obtained from the governor was this, that it was at that time impossible to ascertain any of those particulars. It appears, however, from the testimony of other persons, that these islands in general are rocky and barren; that the only article cultivated for exportation is cotton, of which the medium export is 1500 bags of two hundred weight; that the inhabitants, who in 1773 consisted of 2052 whites and 2241 blacks, have been of late years considerably augmented by emigrants from North America; but of their present number no precise account is given. Edward's Hist. of the West Indies, vol. i. p. 470.

BAHAMA SWORDS, called the gulf of Florida, the narrow sea between the coast of America and the Bahama islands, about 43 leagues long, and 16 broad.

BAHAMA BANK, Great, a bank of sand extending from near the island of Cuba, N. lat. 20° 20', to the Bahama islands, N. lat. 26° 15'. The fund which lies to the north of the island Bahama is called Little Bahama Bank.

BAHAR, or BAR, in Commerce, a weight used at Ter- nate, Moja, in the Moluccas, Achem, and divers other parts of the East Indies. There are two kinds, the great, with which spice is weighed, equal to 524 lb. 9 oz. avoids- dupas. The little bahar served for the weighing quickfoil-
ver, vermillion, ivory, silk, musk, and other precious wares, equal to 437 lb. 9 oz. avoidance of weight.

BAHAR, in Geography, one of the eleven soubans, or provinces, into which Achar divided Hindoostan proper; bounded on the south by Bengal, on the north by Napat and Boontan, on the south by Orissa, and on the west by Oude, Benares, and Allahabad. It has been estimated at 250 miles from north to south, and at 200 miles from west to east. It produces wheat, rice, peas, &c.; but the principal article of export is saltpetre; most of that which is imported by the East India company being manufactured in this province. The capital is Patna. Mr. Fraier, in his "Life of Nadir Shah," rates the revenues of this province, under Aurung-Zebe, at 101½ lakhs of rupees. The greatest part of Bahar is populated by the British nation; but there are several pargunnahs, or hundreds, on the south-west of Little Nąpour, that were formerly chaffed as belonging to Bahar, which are now in the possession of the Maharrats.

BAHAR, a town of Hindoostan, in the province of the same name; remarkable for its number of funeral monuments; 50 miles south-east of Patna, and 240 north-west of Calcutta. N. lat. 25° 14'. E. long. 85° 45'.

BAHAR, or Burea, a town of Persia, in the province of Kerman; 40 miles south-east of Sirgian.

BAHARITES, derived from the Arabian lobar, or fat, and denoting maritaine, in History, the denomination of a class of perfons in Egypt, who having affaflinated Tourn Chah, the last of the family of the Aioibetes, reigned over Egypt and Syria for 156 years, and had 27 kings. The Baharites were of Turkish origin. Nejm Edin purchased them of the Syrian merchants. They were dethroned in their turn by the Mamalukes or Cescadian flaves, in the year 724 of the Hegira, A.D. 1322 who formed a new dynasty which kept possession of Egypt until the conquest of Selm, emperor of the Ottomans, in the year 923 of the Hegira, A.D. 1517.

BAHARNAGASH, a country of Abyssinia, adjoining to the province of Tigris, and situate between the river Alatuspes and the Arabian gulf. Its capital is Dobawra, in N. lat. 15° 22'. E. long. 39°.

BAHAS, in Geography, a town of Arabia, sixteen miles N.N.W. of Lohein.

BAHBELGON, a town of Hindoostan, in the country of Baghiana; 65 miles west of Aurungabad. N. lat. 20° 45'. E. long. 74° 51' 30'.

BAHI, a province of the island of Luçon or Manilla, one of the Philippine islands. It produces excellent betel, which the Spaniards are continually chewing; and it is the place where most of the ships are built. The province is about 30 leagues in circuit, and contains about 6000 tribu-
tary natives.

BAHIA, DE TODOS LOS SANTOS, a province of Brazil, in South America, and the richest in the whole country; but the air and climate do not correspond with other natural advantages. The province is fertile in sugar and other articles of commerce, that the Portuguese re-
port in great numbers to it, as the seat of affluence, and alfo of pleafure and grandeur. The capital called St. Salvador, or Ciudad de Backia, is populous and magnificent, and by far the moit gay and opulent city in Brazil. It stands in a bay in S lat. 12° 11'; it is naturally strong, and is also well fortified and defended by a numerous garrison. See St. SAINTS, and ST. SALVADOR.

BAHIR, in Literary History, denotes famous and illustrious, and is particularly used for a book of the Jews, treating of the profound mysteries of the cabbala; being the moit ancient of the Rabbinical works.

BAHIRA, or RIT, in Geography, the northern district of Egypt, extending from the division of the Nile to the eait and west branches, on both sides to the Mediterranean. The principal towns are: Alexandria, Nitetta, Damietta, Menoufi, Manfouira, Tighe, Catisch, and Duphar.

BAHIRA, among the Ancient Arabs, a name given to one of the four kinds of camels or sheep, which, for some rea-
sons of their religion, were turned out at liberty with an ear-
mark, no longer to be used for service like other cattle. The bahira, with the fohri, weftri, and bami, were abo-
ilished by Mahomet as no ordinance of God.

Authors are not agreed as to the characters of the ba-
hira.

BAHRAITCH, in Geography, a town of Hindoostan, in the province of Oude, 55 miles N.N.E. of Lucknow. N. lat. 27° 30'. E. long. 81° 57'.

BAHRT, CHARLES FRÉDÉRIC, in Biography, a theo-
logical and spirituul writer, was born at Bischofswerd, Aug. 25th, 1741. Having commenced his education, with-
out much improvement, under private tuition at Leipfe, where his father lived, he was removed to a public school, and afterwards to the grammar school at Pfort. From hence he returned to Leipfe, where after receiving some private instruction in the Greek and Latin from Ernesti, he was entered in the university, and quitting it after two years, he commenced preacher in the vicinity of Leipfe. In 1761, he was admitted to the degree of master of arts, and some years after he was appointed extraordinary pro-
feffor of sacred philosophy. In 1763, he published a work, intitled, "The true Christian in Solitudo!" and also his "Commentary on Malachi," in which he endeavoured to display his talents in biblical criticism, and his knowledge of oriental literature. An intrigue, which rendered him a father, defeated all his expectations at Leipfe, and obliged him to retire to Halle; and he was appointed profeffor of biblical antiquities at Erfurt. Having no falary, but sup-
pelled with money by his father, he found his situation agree-
able; however he introduced some remarks of a theological kind, which were not thought orthodox; and complaints were preferred against him by Schmidt and Vogel, two clergymen of that city. In order the more successfully to repel the accusatiou of his antagonists, he purchased the de-
gree of doctor in theology from the university of Erlangen, which gave him a right to read public lectures in divinity; and in 1769, he published in his defence the first part of his "Essay towards a System of the Doctrines contained in the Bible." About this period he also published "The earneit Wifhes of a dumb Patriot," in which he attacked the weakest proofs of the fundamental truths of the theolo-
gical systen, and endeavoured to raise refuptions againift profeffor Schmidt of being a Jefuitical fectarian. His con-
duct in this respect was reprobated by the faculty of divines at Wittenberg, and those of Gottingen recommended re-
conciliation. In 1770, Bahrdt published at Erfurth his "System of Moral Theology," which was favourably re-
ceived, and he embarked, from a defire of fame and love of money, in some other projects and undertakings. The approbation generally bestowed on his critical performances induced him to undertake an edition of the Old Testament similar to that announced by Dr. Kennicott; but neither his knowledge nor situation promised success, and his inten-
tions were never fulfilled. He afterwards thought of improving his finances by marriage, and espoused a young widow of Mulhausen with a fortune of 6000 dollars. In 1771, he entered on the office of fourth profeffor of philo-
osophy at Gieffen in Hesse; and here, in the space of four years, he published two "Collections of Sermons," a "Book of
of Homilies," his "Apparatus Criticus Veteris Testamenti," a General Theological Repository," "Outlines of an Ecclesiastical History of the New Testament," "Proposals for explaining the Doctrines of the Church," "A Critical Examination of Michaelis's Translation of the Bible," and "The purest Revelation of God," i.e. a translation of the New Testament with notes. The heterodoxy of his opinions raised a violent storm against him at Gießen; but he escaped it by a removal to the office of director of the philanthropium of Von Salis at Marlichinz, in Switzerland, with a salary of 2000 florins. He soon however changed his situation, and in 1776 removed to Durkheim, and established a seminary of education at Heidelberg. His philanthropium was opened in 1777, and for some time it prospered; but he involved himself in debt, and being under the necessity of removing, he determined to visit Holland and England for the purpose of procuring pupils in those countries. On his return to Heidelberg with 13 pupils, he was informed that he had been suspended from all his employments by a conclusion of the imperial council. Bahrdt had now no other resource but that of quitting the empire, and seeking refuge in Prussia. Accordingly in 1779, he retired with his family to Halle; and had again recourse to his pen. Here he published extracts from the sacred scriptures, under the title of "The Bible in Miniature," which was printed in 1780; and he delivered private lectures on philosophy, humanity, and rhetoric; and he also read lectures on Tacitus and Juvenal. Upon his first arrival at Halle, he acknowledges, in his life, that there were some latent sparks of religion in his mind; but that they were soon totally extinguished by his intercourse with deists. In the works, therefore, which he now published, he endeavoured to teach the doctrine and history of Christianity separate from everything supernatural, accommodated to reason, and agreeable to his own ideas of its original simplicity. But his health declining, he was under the necessity of altering his mode of life, and he purchased a vineyard with a small farm attached to it in the neighbourhood of Halle. Part of his manor was fitted up as a tavern and coffee house; and in this situation Bahrdt acquitted himself as a landlord and a pleasant companion. But his affection and confidence being directed towards a maid servant who managed his house, he obliged his wife, by the most cruel treatment, to leave him; and when the afterwards returned to him, she became a victim to still greater barbarities. Bahrdt, whilst he was in England, had been initiated in masonry; and in the year 1781, upon the perusal of Stack's book on the mysteries, he adopted the notion that Jesus Christ must have intended, by establishing a secret society, to preserve and diffuse among mankind truth almost banished from the world by priests. This idea he propagated in his "Accomplishment of the Plan and Object of Jesus," and in the third edition of his "Translation of the New Testament." In the year 1784 or 1785, a society of twenty-two united maons was established in Germany, with a view of improving the arts and sciences, commerce, and above all, religion, among the common people. Bahrdt became a member of this society, and proposed that it should engrave the business of book-selling, partly with a view to gain money, and partly for obtaining the complete sovereignty of the republic of letters in Germany. This plan, however, not being approved, failed. In 1785 or 1786, he formed another project, which was that of making himself the founder of an avowed delusional sect in Prussia; but it does not appear that he ever seriously attempted it. In 1787, he exerted himself with zeal in supporting the union, and affiliated the members; but after a second meeting, he received notice to discontinue these assemblies. But his own activity was unintermitting, and he continued to propagate his ideas by an epistolary correspondence during the whole of the year 1788. He also published several works calculated to promote his views, and bringing to the union, such as "Observations on the Liberty of the Press and its Boundaries," and "Za Moor, or the Man of the Moon," in which he delineates free-masonry in Germany, as corrupted by the wildest fanaticism and the darts of popery. There also appeared about this time a comedy, called "The Edict of Religion," universally ascribed to him, on account of which he was arrested, and confined at Halle; and during his imprisonment, he wrote "Morality for the People," which has been reprinted as the best finished and most valuable of his works, though he completed it in the course of three weeks. Upon his trial, he was acquitted with regard to the charge that related to the union, but declared guilty of having written the comedy, and sentenced to two years imprisonment in the fortress of Magdeburg, which term was mitigated by the king to half that period. During his confinement, his letters were employed in writing the "History of his own Life," which he dedicated to his vineyard, and renewed his barbarities towards his wife, who abandoned him, and left him at liberty to take home his maid-servant and her children. Here he continued his former life as landlord and writer. Being attacked by a disorder in his throat, he recurred to the too liberal use of mercury, and a fever ensuing, he expired on the 23d of April 1792. His works on morality and religion, besides those already mentioned, were very numerous. His factual pieces, being of a temporary nature, have sunk into merited oblivion. The genius of Bahrdt was comprehensive and versatile; but his principles and his conduct were licentious; and his history exhibits the perversion of talents, which properly employed and accompanied with integrity, might have rendered him respectable and useful. Gen. Biog. BAHREIN, BAHREIN, or BAHREN, a fortified town of Arabia, situated on an island of the same name, called also AXA; which fea. The name is extended to a group of small islands adjacent to one another, the largest of which is Bahrein. Bahrein once belonged to the Portuguese. When they were driven out of the Persian gulf, it fell into the hands of the sheik of Lachfa; but was taken from him by the Persians. The imam of Oman then made himself master of it; but gave it up again to the Persian monarch for a sum of money. It afterwards changed its owners; but in 1765 it reverted into the possession of the sheik of Abu Scheib, and he was then sole monarch of the island. It is famous for its pearl fisheries. (See Pearl.) N. lat. 27°. E. long. 49°. BAHREIN is an appellation sometimes given to the province of Lachfa; which fea. BAHR EL ABIAD, or the White River, a name given to the real Nile, near its first source; the fountains of which in the African Alps of Kuni remain to be explored. BAHR EL AZZEK, BLUE RIVER, or AYEZJIAN Nile, has its chief spring in a small hill, situated in a marsh, and joins the Bahr el Abiad, or true Nile, about N. lat. 16°; the latter is tinged, the former is clear. The Bahr el Azrek was mistaken for the real Nile, by the Portuguese writers, Alvarex, Tilka, &c. probably misled by the vain glory of the Abyssinians; though it was well known to the ancients as quite a distinct river, being the Allipus flowing into the Nile from the Color Palus, now the lake of Demebe. Mr. Bruce has adopted the same mistake; and it is said, that when M. d'Anville shewed him this mistake, he resolved to expunge the White River from his map, though
BAI

though he acknowledges in his work that it is the largest stream. The Bahir el Akk is flayed Abawi by the Abyssinians. The sources of this river were accurately described in the seventeenth century by Puyis, a Portuguese missionary, whose account was published by Kircher and Isaac Volpinus; and has been long ago minutely copied by Bruce, as Hartian has been by printing the two accounts in parallel columns. Tinkerton's Mod. Geog. vol. ii. p. 275.

BAHRENBURG, in Geography, a town of Germany, in the circle of Weilphalia, and county of Hoya, on the river Shillingen, fourteen miles S.S.W. of Hoya.

BAHUS, in Geography, a river of France, which runs into the Adour, about a league above the Sever.

BAI, in Botany, a species of Phalena (Machaerium), of the middle size, that inhabits Europe. The wings are ferruginous, with a small black dot at the base, and a double one at the apex. This is produced from a variegated grey and brown cat spidral, having three doral white lines, and yellowish spots. Feeds on the dead nightshade. Grad. Fabr.

BAI, in Ancient Geography. See BAVIA.

BAIABA, in Geography, a town of Hungary, on the river Danube, 50 miles N. N. W. of Petrervas. N. lat. 46° 40'. E. long. 15° 50'.

BAIA, a sea-port town of Italy, in the kingdom of Naples, and country of Lavoris, eleven miles west of Naples. See BAI.

BAIABAD, a town of Asia, Turkey, in the province of Caramania. 28 miles south-east of Kalkoomi.

BAIAD, in Ichthyology a species of Silurus, having the posterior dorsal fin tiffly or fat; twelve rays in the anal fin; and beads of the mouth eight. Forsk. En. Arab. Inhabits the Nile; color greenish; length one foot or more.

BAJOAR, or BAGADOE, Cape, in Geography, a cape on the west coast of Africa, in the Atlantic ocean; 120 leagues distant from Cape Ger. N. lat. 26° 29'. W. long. 14° 36'. Bajador is also a cape at the north-western extremity of the island of Luzon, one of the Philippine islands.

BALE, in Ancient Geography, now BAYA, an ancient village of Campania, in Italy, situate between the promontory of Misenum and Putoeli, on the Sinus Baiaeus; famous for its hot baths, which served the Romans for the purposes both of medicine and pleasure. The hot springs and medicinal vapours that abounded in the environs of this place must, at a very early period, have excited the admiration of valetudinarians, as bathing was the common amusement and refreshment of the Greeks while in health, and their remedy when diseased; but Baiae does not seem to have attained a degree of celebrity superior to that of other baths, till the Roman commonwealth began to decline. As soon as the plunder of a conquered world was transferred from works of public use and ornament to objects of private luxury, the transcendental advantages which Baiae offered to Roman voluptuaries, flying from the capital in search of health and pleasure, became an object of peculiar attention. The variety of its natural baths, the softness of its climate, and the beauties of its landscape, captivated the minds of those whose passion for bathing knew no bounds. The abductions which they might wish to practice at Rome required an enormous expense in aquaeus, stoves, and attendants; but here they found a place, most delightfully seated, where waters naturally heated to any degree of necieality warmed bubbled spontaneously out of the ground; and its easy communication with Rome was also a circumstance that recommended it. Hither the mighty rulers of the empire retired at first for a temporary relaxation, after the fatigue of bloody campaigns and civil contests. Their habitations were small and modest; but increasing luxury soon added palace to palace, with such expedition and frugality, that space was wanting for the vast demand. Accordingly architects, supported by boundless wealth, extended their foundations into the sea, and drove that element back from its ancient limits, as Horace expresses it:

"Marique Baiae obhrepentis urges
Summum per litera."

But the sea has since recovered much more than it lost. From being a place of resort for a feaon, Baiae grew up to a permanent city; and its wealthy inhabitants rendered it as much a miracle of art as it was before of nature. Its splendour may be inferred from its innumerable ruins, heaps of marble, mosaics, statues, and other precious fragments of life. It flourished in full glory to the days of Theodic the Goth; but the destruction of these enchanted palaces soon followed the incursion of the northern conquerors, who overturned the Roman systen, sacked and burnt all before them, and destroyed or dispersed the whole race of nobility. No hoaror had opulence withdrawn its support, than the unbridled sea rushed back upon its old domain; moles and batteries were torn abacer and washed away; whole promontories, with the sacred towers that once covered their brows, were undermined and tumbled headlong into the deep, where, many feet below the surface, pavements of stones, fountains of nudes, and mazes of walls, may be discovered. Internal commotions of the earth contributed also in a great degree to this general devastation. Mephitic vapours and stagnated waters have converted this favourite seat of health into the den of pestilence, at least during the summer heats; and yet Baiae in its ruined state, and stripped of its ornaments, still presents many beautiful and striking subjects for the pencil of the artist. N. lat. 41° 6'. E. long. 14° 45'. Swinb. Trav. vol. iii. p. 42, &c.

BAIANA, in Conchology, a species of Venus found on the shores of Brazil. The colour is ochraceous, varied with black; and the shell is specifically distinguished by being fragile, glabrous, and marked transversely with a few transverse lines. Figured by Bonnet.

BAIANUS SINUS, in Ancient Geography, a bay of Italy in the kingdom of Naples, so called from Baiae, Portus Baiaeus of Pliny, which was enlarged by Augustus, by giving entrance to the sea into the Lacus Lucrinus, and Avern, ordering it to be called Portus Jaicus and Scutium (Scutum). We also read in Tacitus of Baianus Lucrinus, which some have interpreted Lucrinus. This gulf is denominated Grater by Strabo; and he places it between the cape of Minerva and that of Misenum. The modern name is Golfo di Pzezuzzo. From the highest point that forms the bay, a large castle commands the road, where foreign ships of war usually ride at anchor, the harbour of Naples not being sufficiently spacious for the reception of a fleet; here they enjoy good shelter, watering, and victualing; but in summer, risk the health of their crews, on account of the unwholesomeness of the air. At the bottom of the bay, and at the foot of the steep rocks which serve as a foundation to the ruins called "Nero's house," are some dark caves of great depth, leading to the bottom of all vapour baths. These baths are thirty in number; and they are said to have been adorned with Greek inscriptions and statues denoting, by their expressions and attitudes, what particular part of the human frame was affected and relieved from its pains by each particular bath. The springs at the bottom of the grotto are fitted so as to boil an egg hard almost instantaneously. These caverns form to be the spot where Nature has opened the readiest access.
access to the focus of a volcano, which has been within the two last centuries most outrageous in its operations; for to them must be attributed the overturning of the adjacent country, and the total alteration of its surface by the birth of Monte Nuovo, which now blocks up the valley of Averno. Swinh. Trav. vol. iii. p. 48.

BAJAZET I., in Biography, sultan of the Turks, was the son and successor of Amurat I., and denominated "Ildefon," or lightning, on account of the fiery energy of his soul, and the rapidity of his destructive march. He succeeded Amurat in the year 1389, being then about 44 years of age; and having secured his authority at home by the execution of his younger brother, who attempted to excite a revolt against him, he prosecuted the ambitious designs of his father. During the fourteen years of his reign, henobly moved, at the head of his armies, from Boursa to Adrianople, from the Danube to the Euphrates; and though sternly laboured for the propagation of the law, he invaded, with impartial ambition, the Christian and Mahometan princes of Europe and Asia. Having reduced to his obedience the northern regions of Anatolia, made himself master of Caramania, and imposed a regular form of servitude on the Servians and Bulgarians, he passed the Danube to seek new enemies and new subjects in the heart of Moldavia. Whatever yet adhered to the Greek empire in Thrace, Macedonia, and Theffaly, acknowledged a Turk as master, and he was led through the gates of Thessaly, Thessaly, into Greece by an obsequious bishop. The Turkish communication between Europe and Asia had been dangerous and doubtful, till he stationed at Gallipoli a fleet of galleys to command the Hellespont, and intercept the Latin succors of Confiantinople. While the monarch indulged his passions in a boundless range of injustice and cruelty, he imposed on his soldiers the most rigid laws of modesty and abstinence; and the harvest was peaceably reaped and fold within the precincts of his camp. Having obtained the title of sultan from the caliphs who served in Egypt under the yoke of the Malamukers, he was ambitious of defying this title; and accordingly he turned his arms against the kingdom of Hungary, the principal theatre of the Turkish victories and defeats. At Nicopolis, near the Danube, he defeated, in 1396, a confederate army of an hundred thousand Christianis, headed by Sigifindum, the Hungarian king; most of whom were slain or driven into the Danube: and Sigifindum, escaping to Confiantinople by the river and Black Sea, returned after a long circuit to his exhausted kingdom. Among the captives was a body of French crusaders, and in this number were John count of Nevers, the son of the duke of Burgundy, and some of the noblest lords in France. In the pride of victory, Bajazet threatened that he would befeige Buda, that he would subdue the adjacent countries of Germany and Italy, and that he would feed his horse with a bullock of oats on the altar of St. Peter at Rome. Whilst the military talents of Bajazet, manifested on this occasion by the speed and fecrecy of his march, and also by the order and evolutions of the battle, have been acknowledged even by his enemies, he has justly been accused of cruelty in the use of victory. The French captives, who survived the slaughter of the day (the count of Nevers and twenty-four lords excepted, who were afterwards raniomed for two hundred thousand ducats) were led before his throne; and as they refused to abjure their faith, they were successively beheaded in his presence. So absolute was his authority, that his word, pronounced either by way of mercy or destruction, was irre- vocable. In the treaty, after the battle of Nicopolis, it was stipulated, that the French captives should swear never to bear arms against the person of their conqueror; but this inhuman restraint was abolished by Bajazet himself.

"I deplore," said he to the heir of Burgundy, "thy oaths and thy arms. Thou art young, and mayest be ambitious of effacing the disgrace or misfortune of thy first chivalry. Assail thy powers, proclaim thy design, and be assured that Bajazet will rejoice to meet thee a second time in the field of battle." The progres of Bajazet, notwithstanding his threats, was checked by a long and painful fit of the gout. Before he directed his arms against the feeble remains of the Eastern empire, he rendered the emperor, Manuel Palaeologus, tributary, and imposed upon him the humiliating condition of having a Turkish cali and a mofch in his capital. He next threatened and actually invaded Confiantinople; but he was called away by the menaces of a more formidable tyrant than himself. This was the great Timour, or Tamerlane, who, in the year 1400, began his march from Georgia towards Asia Minor. In his first expedition, Timour was satisfied with the siege and destruction of Siwas, or Schasli, a strong city on the borders of Anatolia; and with causing 4000 Armenians, who formed the garrison, to be buried alive for the brave and faithful discharge of their duty. He then turned aside to the invasion of Syria and Egypt, sacked and destroyed Aleppo and Damascus, and took possession of Damascus. To Bajazet he offered peace on moderate terms; but the sultan, confident in his strength, employed the interval in collecting all the forces of his empire, and these two potentates met on the plains that surrounded the city of Angora, in July, A.D. 1402, to a memorable conflict, which has immortalized the glory of Timour, and the shame of Bajazet. Such was the event of this fearful contest, in which two very numerous and powerful hordes were engaged, that the Turks were entirely broken with dreadful slaughter; and Bajazet, afflicted with the gout in his hands and feet, was transported from the field on the fleeteft of his horses. He was pursued and taken, and at fun-fet brought to the tent of Timour. Bajazet, by the mild expotulation of the conqueror, who, with a soothing pity for his rank and misfortune, mingled just reproaches for his pride and obstinacy, was softened into humiliation. "Had you vanquished," said Timour, "I am not ignorant of the fate which you referred for myself and my troops; but I disdain to retaliate; your life and honour are secure, and I shall express my gratitude to God by my elemnacy to man." The "iron cage," in which Bajazet is said to have been imprisoned by Tamerlane, so long and so often repeated as a moral lesson, is now rejected as a fable by the modern writers, who smile at the vulgar credulity. It has been suggested, indeed, that Timour might display an ostentation of magnificence and liberality, towards Bajazet; while, with a view to securitv, he kept his important prize in a "moveable apartment guarded with bars," and indulged his own pride in carrying him about in triumph. In the feast of victory," says Gibbon, "to which Bajazet was invited, the Mogul emperor placed a crown on his head, and a sceptre in his hand, with a solemn assurance of restoring him with an increafe of glory to the throne of his ancestors. But the effect of this promise was disappointed by the sultan's untimely death; amidst the care of the most skilful physicians, he expired of an apoplexy at Akihehr, the Antioch of Paphia, about nine months after his defeat," A.D. 1403, in the fifteenth year of his reign, and fifty-eighth of his life. "The victor dropt a tear over his grave; his body, with royal pomp, was conveyed to the mausoleum which he had erected at Boursa; and his son Moufa, after receiving a rich present of gold and jewels, of horses and arms, was invested by a patent in red ink with the kingdom of Anatolia.

The character of Bajazet was that of a despot with vio-
lent passions, but not habitually cruel; a lover of justice in
the rough summary way practised by arbitrary princes; in-
fitually ambitious, and much addicted to the erection of
pomposous edifices for use or ornamentation. Anc. Un. Hist.
28. 30.

BAJAZET II, Sultan of the Turks, succeeded his father
Mahomet II. in 1481. After being freed from the com-
petition of his brother Zizin, or Jem, he engaged, like his
predecessors, in wars, and made conquests in Moldavia and
Caramania; and he manifested the ferocity of his own di-
position by putting to death, at an entertainment in his pa-
lace, his famous general Achmet. His war with the Sultan
of Egypt terminated in the ruin of the latter power; but
at its commencement Bajazet left a great number of troops
in an invasion of Syria. He afterwards overran Circassia,
and carried many of its inhabitants into captivity. On
the expedition of the Moors from Spain, Bajazet, at the
head of the Mahometan religion, was solicited to revenge
their caufe; and he sent a fleet into the Mediterraneam,
which defeated the Chirillian navy, and ravaged the coasts.
He afterwards reduced Croatica and Bofnia. In compliance
with the request of Sforza, Duke of Milan, he declared
war against the Venetians, and invaded and plundered Fri-
uli. Marching in perfon into the Morca, he took Lepanto,
Moden, and Durazzo; but in 1503, peace took place be-
tween him and the Venetians, who had taken possession
of Cephalonia. Befides these foreign wars, Bajazet encoun-
tered many civil commotions, occasioned by the rebellion of
his fon Selim. The issue of these contests was the rejigna-
tion of the crown to his fon, upon which Bajazet, willing to live
in peace and retirement at Demotica, set out on a journey
thither, attended by a few friends. His progres was slow,
and his fon suspected that he was waiting for some favour-
able turn in his affairs; and therefore his death, after he had
proceeded to the distance of about forty miles from Con-
stantinople, was not without reason ascribed to poison admi-
nistered by a Jewifh physician. He died in 1512, at the
age of 62, after a reign of 32 years. He was active and
vigorous in body and mind, a patron of the learned, him-
self a proficient in literature, and well versed in the philo-
sophy of Averroes, and a punctual obferver of the rites of
his religion. At the fame time he had the fererenes com-
mon to the Ottoman princes, and fied blood without re-
more. He is commendable for his attention to the improve-
ment and decoration of his dominions by many edifices of

BAIBACHTA, in Geography, a town of Siberia, on the
river Irilish, 72 miles N. W. of Tara.

BAIBAZAR, a town of Asiatic Turkey, in the pro-
vince of Caramania, 48 miles west of Angora.

BAIBOU, a town of Armenia, 45 miles south of
Trebizond.

BAICH, two rivers of Siberia, which run into the
Turchnan; one 32, and the other 56 miles N.W. of Turu-
chans.

BAIDARS, the name of a kind of small canoes, used
among the natives of the Kuril islands, and of the north-
western coast of America. In Sauer's "Account of a geo-
graphical and astronomical Expedition to the northern Parts
of Russia, by Billings, in the Years 1785 to 1794," we
have the following account of their construction. The keel
is eighteen feet long, four inches thick on the top, and not
three inches deep, or somewhat less, at the bottom. Two
upper frames, one on each side, about 1½ inch square, and
sixteen feet long, join to a sharp flat board at the head, and
are about fourteen feet shorter than the flem, connected by
a thwart which keeps them about twelve inches afdver.
Two similar frames are placed near the bottom of the boat,
fix inches below the upper ones, about one inch square.
Roumd�icks, thin, and about six inches distant from each
other, are tied to these frames, and project from the fides;
and for the top thwarts are fixed very strong thicks, nearly
as thick as the upper frames, curved, as to raise the mid-
dle of the boat about two inches higher than the fides. Of
these thwarts or beams there are thirteen; one of them is
placed feven feet from the flem; another is twenty inches
nearer the head; and a hop is faftened between them, in
which the rower is faeted. This is made strong, and grooved
for faftening an open fkin, which is tied round the body, as
to prevent any water from getting into the boat, although
it were fink. The fame is covered with the fkin of the
fe-a-lion, drawn and fewed over it like a cafe. The whole is
so extremely light, even when foddon with water, that it
may be carried with fafe in one hand. The head of the boat
is double the lower part, sharp, and the upper part is flat,
refembling the open mouth of a fhip, but thus contrived to
keep the head from finking too deep in the water; and a
thick is tied from one end to the other, to prevent its entan-
gling with the fea-weeds. They are easily rowed in a fea,
moderately smooth, about ten miles in the hour, and they
keep the fea in a frefh gale of wind. The paddles which
they ufe, and which ferve for oars and rudders, are double,
feven or eight feet long, and are cut in the shape of a peal.
If the baidar runs aground, the favage eafily fets it afloat
again. These baidars are ufed in the fiftury for whales, in
the capture of fea-otters, and for other purpofes.

BAIDSCHEN, in Geography, a town of Prufia, in the
province of Lithuania, on the north fide of the Pilla, four
miles euf of Gumbinnen.

BAIER, JOHN JAMES, in Biography, born at Iena, in
Upper Saxony, in 1677, applied himself early to the study
of medicine, and was admitted to the degree of doctor there
in the year 1700. In 1704, he was made professor of phy-
ology at Altdorf; and in 1730, president of the academy
Nature Curiforum. Befides numerous dissertations on va-
tious branches of medicine, he published, "Adagiorum Me-
dercorum Centuria," Abl. 4to. 1718. "Hiftoria Horti
Medici Altdorpi," 4to. 1727. "Oratiorum Variorum Argu-
menti Fabricius," 4to. 1727. "Biographie Profefiorum
Medicin qui in Academia Altdorf usquam vixerunt," 4to.
1728. Nuremb. cum Iconibus, Nummis, et Scriptorum
Cemio. His fon Ferdinand James was in confiderable
ceefam as physician at Nuremberg, at the time of his death,

BAILEU, in Zoology, the name of CERUS MEXICANUS
or Mexican fang, in Baeocraft's Guiana, &c.

BAIF, JOHN ANTHONY, in Biography, was born at Venice,
1552, where he probably acquired and cherifhed his passion
for music. He was the natural fon of the French ambaffador
to that republic; had been a fellow student with the poet
Ronfard, and was clofly united to him by friendship and kin-
dred arts. Baif, like our Philip Sidney, wished to intro-
duce the fett and cadence of the dead languages into the
living, and with the like success. He fet his own verfes to
music; not to fuch music as might be expected from a man
of leters, or a dilettante, confiftinf of a fingle melody, but
to counterpoint, or music in different parts. Of this kind he
published, in 1561, twelve hymns, or spiritual songs; and,
in 1578, several books of fongs, all in four parts, of which
both the words and the music were his own. When men of
learning confeffed to study music à foud, profefors think
the art highly honoured by their notice; but poets are very
unwilling to return the compliment, and feldom allow a mu-

fician to mount Parmisus, or lay his foot within the precipices of their dominions. Baikaf, however, was allowed to be as good a musician as part: and what entitled him to the more notice here, is the having established an academy, or concert at his house, in the suburbs of Paris, where the performance was frequently honoured with the presence of Charles IX. Henry III. and the principal peripolages of the court.

Merlennen, in Geneva, p. 1652, has given a particular account of his establishment, the first in France of which we have met with any record. In this academy or concert, digested by a royal charter, in which voices, viols, and flutes were employed (serenis, foliaer, et folia confunatar, it was expected to recover the three genera of the Greeks, and all the miraculous powers of their ancient muse.

BAIKAL, Lake, or island, in Geography. In the steep part of the Sayan mountains (the eastern continuation of the Altay), at the extremity of the chine, where the country changes to a level plain, seeming itself only a lower mountain between the lofty snow-capped summits, lies a monument of one of the greatest revolutions that the surface of our earth has ever undergone. A lake, not less remarkable for its internal composition than for the space which it occupies, heaves its billows within the craggy cliffs of mountains, through which it is all appearance impossible that any stream can force its way to supply its enormous basin. Nature, in the remote periods of antiquity, seems here to have opened, by some tremendous convulsion, an abyss into which she might pour her enormous floods of water, and cause a part of it to flow over the watery level.

This lake extends from 52° N lat. to 55° 47', in a direction from south-west to north and north-east. Its most common appellation is Baikaf, in the maps rare Baikal; but in the surrounding regions it is generally called the Sea, without farther addition; or sometimes the Holy sea. Both these denominations are extremely natural in a country which to a vast distance round knows no larger mass of waters, and in the mouths of people who so frequently experience the benefits it bestows and the perils it threatens. It is therefore not at all surprising that Gmelin's pilot should have ascribed a sudden storm to the anger of the incensed deity of the waters, who felt himself insulted by the foreign infidel who called his venerable te a lake. Safe from the like danger, we shall however pay greater respect to geographical justice, by making use of the latter term.

The lake Baikal is 550 versts in length; and in breadth, where it is the narrowest, 36 versts. To the north it widens to between 70 and 80 versts. Its depth is very unequal; proceeding from 20 to 80 and 100 fathoms (the fathom at seven foot). In some places, particularly near the isle of Ochon, according to the affirmation of a fisherman, even a founding-line of 200 fathom would not reach the bottom. A number of brooks and rivulets pour their waters into this bason; on the map in Georgia's travels, we count fifty of them; many indeed very inconsiderable, though several others may be deemed large: for example, the Selenga and the Upper Angara, which pursues a course of more than 700 versts. The lake has only one outlet; the Lower Angara, which flows into the Yenisey. Though its bed at the part where it comes from the Baikal is two versts broad, and has a very rapid current, yet it is not by far capacious enough for carrying off all the water collected in that reservoir. Notwithstanding which, the lake never rises more than three feet above its ordinary level, even in the spring season; and therefore it probably may have some subterraneous drain. The bottom, at the shores, consists of gradually rounded rocky fragments, piled on one another; in the middle, of gravelly sand. The lake is extremely clear, so that in eight fathom water the bottom is distinctly seen; in five or six fathom the smallest objects are discernible. At a distance it appears of a greenish hue, owing to the verdant moss with which the fliny bottom is overgrown. It is pure, and very agreeable to the taste; but in the month of July it gets into a state of fermentation, which is called its flowering, whence it becomes turbid as if mixed with a fine yellowish sand, and loses its good taste. More danger is to be apprehended when keeping within three, than out upon the main; for the Baikal is extremely subject to violent gales and storms, which strike and split against the lofty mountains that surround it. The mariners know of no more than three winds, which they denominate after the promontories. The south-west, which is the most constant, and the north-east, are innocuous; the north is more formidable, by reason of its violence, and on account of the shallow shores to the south. But the agitation of the water is out of all proportion to the wind; since in a very moderate breeze the lake frequently rages with great fury, whereas famous winds-only just increase its agitation. There being no rocks or banks in the middle, the waves usually swell seven feet high, almost always quite to the shore. Even when the violence of the storm has abated, the turbulence of the water continues only lasts for several hours. The internal agitations of the lake are still more alarming. With a bright sky, and the surface of the water as smooth as a mirror, all at once the vessel is tossed about with such violent shocks, that the people on board have much ado to save it. In like manner in a particular place a single wave will suddenly arise, which at the same spot is followed by several others. These curious phenomena are supposed to happen in consequence of the contiguity in which the lake is situated below with clefts in the adjacent mountains, the drafts of wind issuing from which force up the water, though not always perceptible above to the same degree.

Thus continually ruffles, it is very comprehensible that, notwithstanding the severity of the climate, the Baikal is not frozen over till the month of December or January. Ice-fields, sometimes of ten versts in dimension, form in the bays, then unite in places, which, previous to the freezing, are covered with a dense cloud. The surface being at length thoroughly consolidated, frequently presents one vast plain of glistening ice, which, though sometimes exceedingly rough, snow, on account of the winds, seldom adheres to it; and therefore, especially to the first travellers, it is extremely laborious to the horses. The furious gusts of winds at times press the people who run by the side of the fidges, to the distance of several fathoms forwards; whereby they are in imminent danger of being frozen, or of falling into the chinks of the ice. These bends become wider and more frequent as the time of the breaking up draws on; boards are then laid across them to facilitate the passage; and in cases of necessity, when the apertures are become too wide to be remedied in that way, canoes are introduced. The ice usually breaks up in May, and then it requires only a few days for dissolving; in several of the bays, however, it lies the whole summer through.

The weather is generally inclement in the parts about the Baikal. The summer is short, and fearely ever palies without night frosts; the winter announces its approach so early as August, by falls of snow. On the icy coasts, such plants grow as are elsewhere only found on the coldest mountains. The caufe of this inclemency of climate is principally to be attributed to the elevation of the whole region, the snow, etc.
and the want of sufficient protection against the north winds.

In the Baikal are numerous islands; most of them, however, very small. The largest is Olchon, in the northern part, separated from the main land by a found, in which are eight islands of inferior dimensions. Olchon is 50 versts in length, eight or ten broad, and terminates to the north in a promontory; the south-eastern part is lower and delitute of forests; in the south-western grow pines, poplars, birch, and willows. The land is so favourable to the nurture of cattle, that the fine droves belonging to the inhabitants find pasture all the winter through, without any particular tending. The population consists of 150 Burats families, many of whom are owners of between four and five hundred head of sheep. The natural propensity to idleness in all pastoral people here finds so much encouragement, that the Burats pass the greater part of the day in carousing.

Round the coast are several objects of consequence to the naturalist. On the western side, above Olchon, in a very beautiful country, skirted by majestic forests, with a fine view of the lake, are several springs, molly cold. Amidst the one is hot water, more remarkable than the rest on account of its curative properties. A Russian officer belonging to the mines obtaining relief from it in some disorder, reduced it to a conduit, which yields 582 gallons every hour; and it is found to be only necessary to dig in its vicinity for coming to hot water. The water is clean, but has somewhat of a fctal taste; the vapour smells like fixed gunpowder, and occasions freezing; birds are boiled in it in twelve minutes, slit fish in fifteen minutes. No snow therefore remains here upon the ground; the lake likewise continues free from ice; and even the cold springs, where they run through the territory of the hot, are tepid. These hot springs are useful for bathing as well as for drinking. Some years ago a lama performed frequent cures by means of these waters; since his death, however, the Russians are the only persons who occasionally resort to them.

The Upper Angara flows through the northern margin into the lake, after having purified a course of 800 versts, down several precipices, forming tremendous cataracts, along a tract of near a hundred miles. Not far from its mouth, eastwards, is the Frolikha lake, fifteen versts long, and from one to five versts across, remarkable for its extraordinary depth, and for a cataract on its way to the Baikal. The river Frolikha, between fifteen and twenty fathoms wide, forms this cataract by rolling over a succession of rocks, extending half a verst and being twenty feet in perpendicular height. More to the south is again a hot source, pellicud, and in taste resembling soap-water; in the morning the efflavia it cast is enough to make one sick. The water infuses in a copious stream, but is turned to no account.

On the Shamane promontory stands a curious lufus nature; namely, three rocks adjacent to each other, upwards of two hundred feet in height above the water's level. Their tops resemble human heads, with caps on them. It may well be imagined that the particular features are not small. Of the middlemost, which is the biggest, the noise is in length seven feet, in the slit of the mouth two families of sea-gulls are commodiously lodged; even the eyebrows are not wanting; only there is no trace of an ear. The Tun-gufes reverence these three rocks, as the sacred Diauds, with his two subordinate deities. He is able to tame any Tun-guf from drowning, to cause a good draught of fishes, &c.

The peninsula Barguzin, thirty versts long and fifteen broad, is thickly wooded, but void of game and fish, consequently cannot boast of a numerous population. Lower down to the south is the Dukhovoi or Vapoury lake, five versts long and three broad. Its yellowish flamy water is of a nauseous acid taste; the whole district is charged with its fetid exhalations; yet the water taken in a vessel has no remarkable odour. It even abounds in pike, perch, and various other sorts of fish, which, however, often in winter, when the ice remains without punctures, are licked in the purifying water. Whence it may be, that the horrid fench of this region arises not so much from the lake itself, as from the prodigious quantity of fish that lie corrupting on the shore.

The most famous of all the mineral waters on the coasts of the Baikal is the Turka, celebrated since the commencement of the late century, not yet however employed according to its merits. It consists of seven springs, some of hot, others of cold water, which in one place have been collected into a reservoir. It is visited both by Russians and Burats, labouring under disorders, who generally find relief from it. The former, on their recovery, erect crosses; the Pagans plant young cedars about the spot, hanging up like wise on poles silk and cotton fluffs, as votive offerings to the deities; in the same view they also throw into the water. Without waiting for any revealed authority from the Siberian gods, the Russians carefully convey away all the mineral articles, making by that means sometimes a profit of ten rubles in the year, a capital sum for this part of the world! A little above the Turka is obtained naphtha, which the lake casts ashore in the spring, hanging to the ice, or in iced, with ice, in lumps often as big as one's fist. This dark brown chamy substance, which probably oozes up from the bottom of the lake, though tolerably viscous, may however be kneaded, and is soluble in moderately warm water. It has rather a fragrant odour, and is used in healing wounds, particularly as a salve for running sores. Their parts about likewise in various species of alkaline salts, which have of late been collected for the use of the apothecaries.

Southwards from the Turka is the mouth of the Selenga, the largest river that debouches into the Baikal, and whereon the two cities Udinka and Selenga, are situated. In its mouth lie scattered a few islands. Lower down lands the delta of Poleses, which is the landing-place on coming across the Baikal from Irkutsk. The south-western mountainous border of the lake is called Kultus.

We now proceed to the particularities of animated nature in this extraordinary lake. Among the aquatic animals, the prime rank is certainly due to the callotinus, called by the Russians golomyanka, entirely peculiar to the Baikal. He is from four to six inches in length, and, excepting his head, black, and a slender back-hone, consists only of blubber, into which he immediately dissolves on being exposed to a gentle heat. None of these fish, however, are caught in lakes or otherwise; it is even extremely rare to see them alive; it is only during violent agitations of the water that they are raised to the surface and cast ashore, generally either dead or in a dying state. This chiefly happens in summer, when it blows a tempest from these north; though not every year alike. Shoots of them are often found piled up in heaps on the shore, particularly near the mouth of the Selenga: at times they are so rarely seen, that the old fishermen even aver that it is only of late years that they have been seen at all. Whence and how they are thrown up and ejected cannot indeed be satisfactorily ascertained; unless it be probably in consequence of their usual haunts being the deepest chains at the bottom of the lake. That these may possibly be connected with the crevices of the mountains, we have already
already conjectured; and if this be admitted, it is far from improbable, that, in heavy gales, the wind furiously rushing through these vents, may lift them from their holes into the upper water, where, unacclimated to the outward air, they cannot long survive this change of place. The frogs that are call abroad are partly devoured by the sea-fowls, and partly boiled to oil by the inhabitants of the island, which is said to be very fine and well tasted; at least it must be so to the Chinese, who buy it in great quantities.

Another particularity, at least to the Baikal, are the palfes. As they elsewhere only live in salt water, and never travel far up the rivers, it is the more surprising how they came into this fresh-water lake, which has no communication with the sea, nor with any river that contains these animals. Though the rill farms may fall on the Yenisey and the Angara, yet in neither of these rivers are any of them, now at least, to be found, and it would be extremely difficult for them to shoot the cataracts on the passage from the Yenisey to the Baikal. Perhaps in some great inundation, the sources of the Lena might have communicated with the rivers of the Baikal; and on that occasion the primitive race of them might have moved hither. They are of the same species with those of the Caspian and the Baltic; excepting that scarcely any of them are of varied hues. They are particularly fond of the ice; and show themselves above water rather in the winter than in the summer; for which purpose they blow up of themselves air-holes in the ice, which they have the art of keeping constantly open; and in the spring drop their young upon the ice, for whole accommodation they make little holes of snow. The reason for the chance of them hatching from the beginning of March to the breaking up of the ice at the latter end of May; the right of catching them is firmed out. They are caught with fire-arms or pierced with javelins; in both cases from a concealment behind a screen of white linen, which the animals mistake for a piece of ice. The old ones are made to yield their blubber; but the young are chiefly sought after because the Chinese are extremely partial to their silver grey skins. In the carion, the Burets share with the crows. The annual capture is estimated at between 1500 and 2000 of these animals.

The omul (Salmo migratorius) is a fish of great consequence, in regard to its prodigious numbers, not only to the Baikal, but to all the country round. His ordinary length is from fourteen to sixteen inches; seldom extending to two feet. His flesh is white and tender, and so delicate that he dies as soon as taken out of the water, even though immediately thrown in again. In August, the omuls generally begin to approach in schools of various bulk, in order to ascend the rivers in which they spawn. In September they return, but so unacclimated a condition, that multitudes die upon the passage. They do not go up every river; those on the western side not at all, and even not every one on the eastern side of the lake. Each fish is wont to go to spawn in the place where itself received life. They are caught the whole summer long; but mostly at the time of their floating in the rivers. With fine nets 2000 of them are taken at a draught. They are thrown together in great heaps upon the shore; but ere the fishermen have time to prepare them, the Tungus, the dogs, and the birds of prey, have devoured a good part of them. The omuls are fished, oil is obtained from them, and even fine caviar, which however will keep only a very short time. Besides these, the Baikal produces many other sorts of fish: such as sturgeon, quabs, carp, perch, trout, trout, pike, &c. in great abundance.

One very singular natural phenomenon of the Baikal we have referred to the lake, as being probably the original cause of the existence of the lake itself; we mean the earth-quake that are very frequent in the parts adjacent. They are most usual in the spring and autumn; generally once, sometimes twice a year. The flocks are not violent, last a few minutes, and do scarcely any mischief. At half the utmost injury that attend any one of the sixteen earthquakes described by professor Geiges, was, that it gently waked him out of his sleep, threw down the floor in the police-offices at Schilingsfjord, and shook off some of the croffes from the tops of the church-steeplees. Nature seems to have exhausted herself in forming the bed of the Baikal; for it is highly probable that it was the effect of some tremendous earthquake, attended by an extraordinary falling-in of the earth. We are naturally led to this hypothesis by considering the rate of the circumjacent region, and of the bottom of the lake. This latter consisting of fragments of demolished rocks, the largest of which thump up their tops as islands; the传导 aound is one amazing congeries of rent, broken, and split rocks, to the height generally of forty fathoms; flinted portions of rocks lift their bare segments to the clouds, while the other parts of them lie rooted in the heart of the earth. On the craggy pinnacled sides of the snow-covered mountains lie broken tops of rocks in the shape of beehives, which only the powerful hand of nature could have projected thither; as it was the who fenced the Baikal round with majestic cliffs, and fixed their bases in unfathomable pits. But when—History is silent. And how?—The naturalist can only conjecture; he has recourse to an earthquake, and imagines, that here perhaps formerly the streams of the Upper Angara flowed, the territory whereof is now engulfed by the broad lake.

The country round the Baikal forms a part of the government of Irkutsk, and belongs chiefly to the province of Nerchinsk. Irkutsk lies at the distance of about 50 miles upwards from the Baikal. The inhabitants of the confines of the lake are Tungus, Burets, and Mongoles; the Russians are few and numerous, because the land adjacent to it is not favourable to agriculture; though even on the eastern side winter-rye, oats, and barley thrive tolerably well. The whole of the population on the eastern side of the lake, from Turkei to the Upper Angara, amounted, in 1771, to not more than 5000 souls.

Besides the numerous birds of prey that seek their food in the neighbouring forests, multitudes of winged guests are attracted hither by the exuberant forces of fish with which the lake abounds. These consist of the various tribes of newfs and herons; but more numerous than all are the gulls, in fine resembling a full grown duck, but incomparably heavier. They come in the month of April, and take their departure in October. Every thing bears marks of their devastation; the very trees in which they roost perihy, partly by their corrosive dung, and partly in consequence of their biting off the buds. They are said to consume more than one half of the omuls that go up the rivers. This may be thought surprising after what has been before observed of the prodigious quantities of these fish; not however to altogether incredible, when we are informed that these foals hatch about ten young ones at a brood, and are extremely voracious. Not content with eating their fill, they overload themselves in such a manner, that beneath the rocks where they nestle, the foxes, ermines, magpies, and crows constantly find a plentiful banquet. In many places the nets of them are so numerous, that the people have much ado to pass along the rocks. The illes in the sound between Olchon and the main land, being the principal haunt of these birds, take their name from them.

The forests are overrun with quadrupeds. Wolves and bears roam there in great abundance; but the latter at least are
are by no means formidable. Nothing scares them so easily as fencing; accordingly the Buruts are so confidem as to compose particular times for them. The louder the vocal performer pitches his notes, the taller the stupid bearer fappers from him. The Buruts hunt them for the sake of their flesh. Stags, elk, and roe-bucks are very numerous; rein-deer are far less frequent on the northern shore. The wild hares are silver gray, and scarce; both perhaps in consequence of the cold climate. The race of fables is not yet so thinned as in these regions as in some others; those taken here are esteemed as eminently valuable; such especially as range about the Upper Angara, are prized for the blackness of their fur. Termes are so prolific, that while M. Georgi was at Irkutsk, a contract for twenty thousand skins to be delivered at St. Petersburg might be completed in a couple of days. Not less numerous in winter are the white hares, of whose large and stout ears pelisses are made, each at one end, and one half a nobles. The Tunguska pay their tribute in squirrel-skins; besides these, many Russian hunters collect a thousand pites in one winter, and yet there is no perceptible diminution of the animals.

**Baikal, Mere of the.** In the region of the Baikal, 234 miles from Irkutsk, on the Lena, extends a bed of copper ore, which seems to reach, for 500 miles, to the river Kiren. The country of the latter river is far more hilly, consisting partly of line-clone, whence several mineral sources proceed. Nor are specimens of copper wanting. Iron ores and ferruginous rocks are everywhere where met with in abundance. On the Lena here and there are beds of argentiferous glatz galena, interfused with line-clone, and at times appears in lumps of two or three pounds. It was first explored about sixty years ago by M. de Mefres. Make and Kutunof. They keep four machines at work at the copper-flats, near the villages Botom and Shennaya. The ores are green-copper, brown-copper, copper-glafls, faltz-clones and malaquite. The gangues are calcareous and sandy. The narrower the gangue, the richer it is. The proportion is one fourth to forty per cent. copper, but scarcely a trace of silver. On an average one hundred pound of ore yields four pound of good copper.

**Baikal, Mountains of the.** This range of mountains takes nearly the same direction with the Baikal lake, accompanying it on both sides from south to north and east, runs down to the west on the right of the Angara, where it flattens in a muraille flepp of prodigious extent; to the east it advances from the origin of the Lena, on both sides of that river, and here likewise dies away in a widely extended flat. In general, it is a very grassy and pitched mountain, partly confiding of granite, partly of flat-breaca and line-clone. In the inferior regions of the Angara, and the Lena, its flatz-mountain greatly declines, and frequently produces coal. From the upper Angarian ridge there runs as it should seem, a branch westward, through the region between the Podknemenia, and the lower Tunguitska, away over the Venifley, and consists probably of mere flatz-mountains. About the north-eastern part of the Baikal, the Upper Angara, the rivers Mama and Vtim, where lie the famous pits of mufcovy-glafls, all the mountain is granite. The mineral contents of these mountains are as yet by far not thoroughly known. The principal of what has been discovered in them, are coals, asphalites, sulphur-foures, native sulphur, alum, common salt foures, laps lazuli, mufcovy-glafls, carnellins, natural pruffian blue, and specimens of copper, iron, and lead. Some tracts of mountains about the Baikal, for example, the Burunda, and others, are so high that they are covered with never-waiting snow. In the lake itself many lofty

---

**Bail, in Law.** The fetting at liberty one arrested or imprisoned upon any action or other criminal, under forfeit taken for his appearance at a day and place assigned. It is called *bail*, because hereby the party confined is bailed, from the Greek βαιλος, delivered into the hands of those who bind themselves for his forthcoming: or from *bail*, used in the sense of a guardian, into whose hands the party is put for security sake: and the end of bail is to satisfy the condemnation and costs, or render the defendant to prison.

Manwood distinguishes between *bail* and *mainprize* thus: he that is mainprised is said to be at large, and to go about at his liberty, without ward, till the time of appearance; whereas he who is let to *bail* to two or more men, is always accounted by law to be in their ward and custody for the time; and they may, if they please, actually keep him in prison.

With respect to *bail* in civil causes, it is to be observed, that there is both *common* and *special bail*.

**Common bail** is that given in actions of small prejudice, or light proof; in which case any nominal sureties are taken; as John Doe, and Richard Roe: this being no other than a form of appearance: whereas *special bail* is given in causes of greater moment, where it is required that the sureties be substantial men, and according to the value of the matter in question.

It has been enacted that no persons should be held to special bail in any action brought for less than ten pounds. In order to which it is required by *The 13 Car. II. 6. 2. that the true cause of action should be expressed in the body of the writ or procee*; *Also to security can be taken in a greater sum than 40*. This is observed as to writs issued out of the courts of Westminster-bench, and extended to all inferior courts by *19 Geo. III. 7. c. 2.0*.

The method of putting in *bail* to the *sheriff*, is by entering into a bond or obligation, with one or more sureties (not fictitious persons, as in the case of common bail, but real, substantial, responsible bondmen), which obligation is called the *bail-bond*. The sheriff, if he pleases, may let the defendant go without any sureties; but that is at his own peril: for, after once taking him, the sheriff is bound to keep him safely, so as to be forth-coming in court; otherwise an action lies against him for an escape. But, on
the other hand, he is obliged, by c. 23 Hen. VI. c. 10, to take, if it be tendered, a sufficient bail-bond; and by c. 12 Geo. I. c. 29, the sheriff shall take bail for no other sum than such as is sworn to by the plaintiff, and endorsed on the back of the writ. By rule M. 1654, no attorney shall be bail for a defendant in any action, nor his clerk. Cowper, 228. n. But an attorney may be admitted as bail in a criminal case. No sheriff's officer, bailiff, or other person concerned in the execution of process, shall be permitted to be bail in any action or suit depending in K. B. nor persons outlawed after judgment, R. M. 14 Geo. II. Upon the return of the writ, or within four days after, the defendant must appear according to the exigency of the writ. This appearance is effected by putting in and justifying bail to the action; which is commonly called bail above. If this be not done, and the bail that were taken by the sheriff below are responsible persons, the plaintiff may take an assignment from the sheriff of the bail-bond (under the statute 4 & 5 Ann. c. 16), and bring an action thereupon against the sheriff's bail. But if the bail so accepted by the sheriff be insolvent persons, the plaintiff may proceed against the sheriff himself, by calling upon him, first to return the writ, if not already done, and afterwards to bring in the body of the defendant; and, if the sheriff does not then cause sufficient bail to be put in and perfected above, he will himself be responsible to the plaintiff.

The bail above, or bail to the action, must be put in, either in open court, or before one of the judges thereof; or else, in the country, before a commissioner appointed for that purpose by virtue of the statute 4 W. & M. c. 4, which must be transmitted to the court. These bail, who must be at least two in number, must enter into a recognizance in court or before the judge or commissioner, in a sum equal (or in some cases double), to that which the plaintiff has sworn to; whereby they do jointly and severally undertake, that if the defendant be condemned in the action, he shall pay the costs and condemnation, or render himself a prisoner, or that they will pay it for him: which recognizance is transmitted to the court in a slip of parchment entitled a bail-piece. And if excepted to, the bail must be perfected, that is, they must justify themselves in court, or before the commissioner in the country, by swearing themselves housekeepers, and each of them to be worth the full sum for which they are bail, after payment of all their debts. See Sarumato.

Special bail is required (as of course), only upon actions of debt, or actions on the case in trover, or for money due, where the plaintiff can swear that the cause of action amounts to ten pounds; but in actions where the damages are precarious, being to be afforded ad libitum by a jury, as actions for words, ejectment, or trespass, it is very seldom possible for a plaintiff to swear to the amount of his cause of action; and therefore no special bail is taken therein, unless by a judge's order, or the particular directions of the court, in some peculiar species of injuries, as in cases of mayhem or atrocious battery; or upon such special circumstances, as make it absolutely necessary that the defendant should be kept within the reach of justice. Also in actions against heirs, executors, and administrators, for debts of the deceased, special bail is demandable; for the action is not so properly against them in person, as against the effects of the deceased in their possession. But special bail is required even of them, in actions for a demesne suit, or waiting the goods of the deceased; that wrong being of their own committing.

In civil cases every defendant is bailable; but in criminal matters it is otherwise. Bail may be taken either in court, or in some particular cases by the sheriff, coroner, or other magistrate; but most usually by the justices of the peace. Regularly in all offences, either against the common law or act of parliament, that are below felony, the offender ought to be admitted to bail, unless it be prohibited by some special act of parliament. By the ancient common law before and since the conquest (2 Inst. 189. Glanv. l. xiv. c. 1), all felonies were bailable, till murder was excepted by statute; so that persons might be admitted to bail before conviction almost in every case. But the statute 1 W. & M. c. 15, 3 Edward I. c. 15, takes away the power of bailing in treason, and in divers infamies of felony. The statutes 23 Hen. VI. c. 9, and 1 & 2 Ph. & Mar. c. 13, give further regulations in this matter; and upon the whole we may collect (2 Inst. 186. 2 Hal. P. C. 129), that no justice of the peace can bail, upon an accusation of treason, of murder, of manslaughter, if the person be clearly the slayer, and not barely suspected to be so, or if any indictment be found against him; such, as being committed for felony, have broken prifon, because it not only carries a presumption of guilt, but is also superadding one felony to another; persons outlawed, such as have abjured the realm; approvers, and persons by them accused; persons taken with the maimour, or in the fact of felony; persons charged with arfon; and excommunicated persons, taken by writ de excommunicato causa. Others are of a dubious nature, as thieves openly defamed and known; persons charged with other felonies, or manifested and enormous offences, not being of good fame; and accessories to felony, that labour under the fame want of reputation. These seem to be in the direction of the justices, whether bailable or not. Those who might be bailed, on offering sufficient security, are persons of good fame, charged with a bare fulpicion of manslaughter, or other inferior homicide: such persons, charged with petit larceny, or any felony, not before specified; or with being accessory to any felony. Lastly, it is agreed, that the court of king's bench, or any judge thereof in time of vacation, may bail for any crime whatsoever, be it treason, murder, or any other offence, according to the circumstances of the case; such persons only excepted, who are committed by either house of parliament during the session, or such as are committed for contempt by any of the king's superior courts of justice. This refusal, or delay, of bail for any person in any case, is an effectual punishment. But the liberty of the felon, in any magistracy, by the common law, as well as by the statute Wilm. 15 Edw. l. c. 15, and the baile causa aet, 31 Car. II. c. 2. And it is expressly declared by statute 1 W. & M. 2. c. 1. that execrable bail ought not to be required; though it is left with the courts to determine, on considering the circumstances of the case, what bail shall be called execrable. On the other hand, if the magistrate take insufficient bail, he is liable to be fined, if the criminal doth not appear. Blackf. Com. vol. iii. vol. iv. For several circumstances and considerations with regard to bail in civil cases and in criminal matters, see Jacob's Law Dict. by Tomlynus, vol. i. Art. Bail. Bail above, or Bail to the Action, succeeds the return of the writ, or the appearance of the person bailed. See Bail.

Bail-Bond, is a bond or obligation entered into by one or more sureties, upon putting in bail to the sheriff, informing the defendant's appearance at the return of the writ. See Bail.

Bail in Error, expresses the bail given by a person who brings a writ of error after verdict, or who is liable in error. Bail-Piece, a small square flip of parchment, with the corners cut off at the bottom, on which is the recognizance of persons who put in bail. See Bail.
BAI

BAILE, Clerk of the, is an officer belonging to the court of king's bench. He files the bail-pieces taken in that court, and attends for that purpose.

BAILACAN, in Geography, a town of Armenia, 181 miles call of Erevan.

BAILAN, a town of Syria, ten miles south of Alexandretta.

BAILE, or BAIL, in the Scot Language.—The scamen call lading or calling the water by hand out of a boat or ship's hold with buckets, case, or the like, bailing.

When the water is thus bailed out, they say the boat is freed. They also call those hoops that bear up the tilt of the boat, its bailey.

BAILEMENT, in Law. See Bailment.

BAILLAGE is used for the office of a bailiff, for the place where he keeps his seat, and for the territory subject to his jurisdiction; which last is also denominated bailiwick.

BAILIFF, Water, is an ancient duty received by the city of London, for all goods and merchandises brought into or carried out of the port. See BAILAGE.

BAILIE, in Scots Law, a judge anciently appointed by the king over such lands not erected into a regality as happened to fall into the crown by forfeiture or forfeiture; now abolished. It is also the name of a magistrate in royal boroughs, and of the judge appointed by a baron over lands erected into a barony.

BAILIES, WILLIAM, M. D. in Biography, practiced medicine at London, and then at Bath, about the middle of the last century, but having a dispute with Drs. Oliver and Lucas, who had the greatest share of the business there, he soon quit the city, and went to Prussia, and was made physician to Frederick the Great, to whom he was recommended as a person of great knowledge and experience in his profession. The king telling him, on his being introduced to him, he must certainly have killed a great number of persons in the course of acquiring his experience, the physician is said to have answered, "a plus tant que votre majesty"—not so many as your majesty. The ben not happened to discharge, and the doctor continued in favour with the king to the time of his death.

In 1757, Dr. Bailie published an essay on the Waters of Bath, with the view of making himself known there; also a narrative of facts, proving a conspiracy between the Drs. Oliver and Lucas, to exclude him from all consultations at Bath. Gen. Biog. Dict.

BAILIFF, in a general sense, denotes an officer appointed for the administration of justice within a certain district, called bailiwick.

The word is also written baile, baily, bavly, bavly, and bailiff, in Latin bailiffus.—It is formed from the French bailiff, that is prefectus provincie, of bail, an old word denoting a guardian or governor of a youth, originally derived from the Latin baivulus, which signified the same.

Palquier maintains, that bailiffs were originally a kind of commissioners, or judges delegate, sent into the provinces to examine whether or no justice were well distributed by the courts, who were then the ordinary judges. Loyola, with more probability, refers the origin of bailiffs to the usurpation and indulgence of the great lords, who, having got the administration of justice into their own hands, and being weary of the burden, turned it over to their deputies, whom they called bailiffs.

The bailiffs had, at first, the superintendence of arms, of justice, and of the finances; but abusing their power, they were by degrees stripped of it, and the greatest part of their authority transferred to their lieutenants, who were to be men of the long robe. In France, they assumed some prerogatives, as being reputed the heads of their respective districts; in their name justice was administered, contracts and other deeds passed, and to them was committed the command of the militia.

From these the English bailiffs originally took both their name and their office: for as the French had eight parliaments, which were supreme courts whose appeal lay within the precincts of the several parliaments or provinces, and in which justice was administered by bailiffs, at least by their lieutenants; so in England are several counties where the justice was and is still administered by a vicount or sheriff, who appears likewise to have been called bailiff; and his district or county, bailiwick or bailiff. In the statute of magna charta, c. 28. and 14 Edw. III. c. 9. the word bailiff seems to comprehend as well sheriffs, as bailiffs of hundreds. Further, the counties were again subdivided into hundreds; within which it is manifest, justice was anciently rendered by officers called bailiffs. And it appears by Bracton (l. 3. trac. 2. c. 34.), that bailiffs of hundreds might anciently hold plea of appeal and approvers. But these hundred-courts are now swallowed up by the county-courts, certain franchises alone excepted; and the bailiff's name and office growing in such contempt, at least these bailiffs of hundreds, till they are not now more than bare menangers, and mandates within their liberties, to serve writs, and such mean offices. In other respects, the name is still in good esteem; for the chief magistrates in divers towns are called bailiffs; and sometimes the persons to whom the king's courts are committed are called bailiffs: as the bailiff of Dover castle, &c.

Of the ordinary bailiffs, there are several sorts; viz. bailiffs of liberties, sheriff's bailiffs, bailiffs of lords of manors; bailiffs of huubandry, &c.

Bailiffs of Liberties, are those bailiffs who are appointed by every lord within his liberty, to execute process and perform such offices therein as the bailiff errant doth at large in the county; but bailiffs errant or itinerant, as they were formerly called, who went up and down the country to serve processes, are now out of use.

Bailiffs of liberties and franchises are to be sworn to take diligence to bring in the perjuries of juries, make returns by indenture between them and sheriffs, &c., and shall be punished for malicious dilferences by fine and treble damages, by ancient statutes 12 Ed. II. r. c. 5. 14 Ed. III. r. c. 9. 20 Ed. III. c. 6. 1 Ed. III. r. c. 5. 2 Ed. III. c. 4. 5 Ed. III. c. 4. 11 Hen. VII. c. 15. 27 Hen. VIII. c. 24. 3 Geo. I. c. 15. § 10.

The bailiff of a liberty may make an inquisition and extent upon an elegant. Cro. Car. 319. These bailiffs of liberties cannot arrest a man without a warrant from the sheriff of the county; and yet the sheriff may not enter the liberty himself, at the suit of a subject (unless he be on a quo warranto, or copias ulleagun), without a clause in his writ, non emitas popuer aliquam libertatem, &c. If the sheriff, &c. enters the liberty without such power, the lord of the liberty may have an action against him; though the execution of the writ may lie good. 1 Vent. 426. 2 Inst. 453.

Bailiffs of Sheriffs, are either bailiffs of hundreds, or special bailiffs. Bailiffs of hundreds are officers appointed over those respective districts by the sheriffs to collect fines therein; to summon juries; to attend the judges and justices at the assizes and quarter sessions; and also to execute writs and process in the several hundreds. But as these are generally plain men, and not thoroughly skilful in this latter part of their office, that of serving writs, and making arrests and executions, it is now usual to join special bailiffs with them;
Bailiffs, Royal, bailiffs regis, were those over provinces afterwards annexed to the crown. Something like these still subsist in Scotland, under the title of high or heritable bailiffs; as those of Cunningham, Carrick, and Kyle; the first in the families of the earls of Eglington, the second of the earl of Caithness, the third of the earl of London.

Bailiffs of Boroughs, bailivis burgorum, were magistrate anciently in cities and towns, answering, in some measure, to what of later times was called portrager, mayor, &c.

Canterbury was a bailiff town five hundred years before it was made a mayor town. Welleminister, Southwark, Scarborough, &c. are still governed by bailiffs.

Bailiffs differ in this from mayors, that the latter are always single in one place, whereas there were usually two bailiffs to a city, as formerly at London, and sometimes four, as at Norwich.

Bailiff of the Empire, was anciently the vicar or regent of the empire; as appears from a letter of Henry of Panners to pope Innocent III. wherein he says, the princes, barons, and knights, have elected me bailiff of the empire; bailiwm imperii.

Bailiff, Water, is an officer anciently estabished in all port-towns for the searching of ships, as appears from 28 Hen. VI. cap. 5.

There is such an officer still on foot in the city of London, who supervises and searches all ships brought thereto; and gathers the toll arising from the river of Thames. He attends also on the lord mayor in his expeditions by water, and hath the principal care of marshalling the guefts at the table. He also arrests men for debt, or other personal or criminal matters, on the river of Thames, by warrant of his superiors.

BAILI, DAVI, in Biography, a painter of perspective views, and portraits, was born at Leyden in 1574, learned to draw and design under his father, and prosecuted his studies under Adrian Verburg, and Cornelius Vanderwoort, with the latter of whom he spent six years. Baille copied many capital paintings of some great masters, in the possession of Vanderwoort, with critical care and observation; and particularly a perspective view of the inside of a church, originally painted by Stencywck, which was so accurately finished, that Stencywck himself could scarce distinguish the original from the copy. He traveled for improvement through several parts of Italy, and for some time resided at Rome; and the correctness of his drawings, and the minute handling and finishing of his pictures, procured for him everywhere employment, admirers, and friends. In the latter part of his life he discontinued painting, and only drew portraits on vellum with a pen, which he heightened with black-lead, so as to give them wonderful force and roundness. He died in 1658. Pilkington.

BAILIwick, Bailywick, or Bailiwick, the territory of a bailiff, or the place within which his jurisdiction is terminated. This is not only taken for the county, as it is frequently called in the writs, but signifies generally that liberty which is exempted from the sheriff of the county, over which the lord of the liberty appointeth a bailiff, with such powers within his precinct, as an under-sheriff exerceth under the sheriff of the county; such as the bailiff of Welleminster, &c. Stat. 27 Eliz. c. 12. Wood's Inst. 206.

BAILLEAU L'ESQUIE, in Geography, a town of France, in the department of the Eure and Loire, and chief place of a canton in the district of Chartres, 14 league north-west of Chartres.

BAILLE, a town of France, in the department of the Mayenne, and chief place of a canton in the district of
BAIIER, in Law. See BAILMENT.

BAILLET, ADRIAN, in Biography, an eminent French critic, was born in 1640, of obscure parents, at Neuville, a village near Beauvais. Having completed his education in the college of the city, he took holy orders in 1666, but soon quitted the clerical profession, and devoted himself entirely to study. Lemaison, president of the parliament of Paris, made him his librarian, and in this station he continued till his death in 1705. He was a man of indefatigable application, and extensive curiosity. As he was always reading or writing, it is no wonder that his acquaintance with authors was great, and his works numerous. His principal performance was "Jugemens des Savans sur les principaux Ouvrages des Autheurs," it is a valuable collection of facts and observations. In the first volume he lays down rules for judging of authors and their productions; the three following, published in 1683, treat of printers, critics, translators, authors of discoveries, &c.; and the next five on poets. The work would have been prosecuted agreeably to a plan presented by the author to the public in 1693, if he had not been discouraged by severe criticism and future in the Anti-Baillet of Menage, and other pieces. Abandoning this design, he directed his attention to other subjects; and he wrote, in 1693, "A Treatise on the worship of the Virgin Mary"; and another in 1695, "On the Care of Souls;" "The Lives of Saints," in 4 vols. in 1698.

Baillet is often tedious and uninteresting, and culpably negligent with regard to his style. Gen. Dict.

BAILLEUL, JOHN DE, Abbé de Jérolan, was so famed for his skill in reducing louted joints, Haller says, that his name passed into a proverb, and an expert bone-fetter was called a Bailleul. Hal. Bib. Chirurg.

BAILLEUL, in Geography, a town of France, in the department of the North, and chief place of a canton in the district of Hazencrook; it was formerly fortified, but is now without defence. It contains about 500 houses; three leagues E. S. E. of Caflé, and 4½ W. N. W. of Lille. N. lat. 50° 35'. E. long. 2° 55'.

BAILLEUL, a town of France, in the department of the Sarthe, two leagues from La Flesche.

BAILLAGE, in History, the name of a government in Switzerland, of which there are two forts: the one containing of certain districts, into which all the aristocratical cantons are divided, over which a particular sort of officer, called a bailiff, is appointed by government, to which he is accountable for his administration: the other fort is composed of territories belonging to two or more of them, who alternately appoint a bailiff. This officer, when not restrained by the peculiar privilege of certain districts, has the care of the police, and jurisdiction in civil and criminal causes in the same limits; and enjoys a flated revenue arising in different places from various duties and taxes. In case of exaction or mal-administration, an appeal always lies from the bailiff to the cantons, to which the bailiffs belong; and the place, the time, and the members who receive the appeal are regulated by the utmost exactness. Cowe's Trav. Switz. vol. i. p. 37

BAILLIE, RONAN, in Biography, a Presbyterian divine of the church of Scotland, was born at Glasgow, in the year 1596, and educated in the university of his native city. After he had taken his degree of master of arts, he applied with diligence to the study of divinity; and having, in 1622, received orders from archbishop Law, he was chosen a regent of philosophy in the university of Glasgow. In 1635, he modestly declined an offer which was made him of a chair at Edinburgh, and in 1637 refused to preach a sermon before the Synod in this city for recommending the canon and service book, then published by authority; and flatted in a letter to the archbishop of Glasgow the reasons of his refusal. In 1638, he was a member of the famous assembly at Glasgow, which was a prelude to the civil war, and it appears, notwithstanding the moderation of his con- descent, that he was not desirous of the civil war, and to struggle with the Popular party. He was a member of the following general assemblies till 1635, the time excepted during which he attended the Wellmington assembly. In 1640 he was sent by the covenanting lords to London, to draw up an accoustic against archbishop Laud, for the innovations he had obstructed upon the church of Scotland. Soon after his return, in 1642, he was appointed one of the professors of divinity at Glasgow; and his reputation was such that he received invitations before this time from the other three universities, all of which he refused. He retained his professorship till the restoration; but was often interrupted in the exercise of it by his residence in England; and for in 1649 he was chosen one of the commissioners of the church of Scotland, to the assembly of divines at Wellmington. In the principles and views of this assembly he seems to have entirely concurred; he returned, however, to his own country in 1649. When Charles II. was proclaimed in Scotland after the execution of Charles I. Baille was one of the divines appointed by the general assembly to wait upon his majesty at the Hague, and in a speech delivered on that occasion he expressed, in the strongest terms, his abhorrence of the murder of the late king, and in his sentiments with regard to this event the Presbyterian divines of that period, both at home and abroad, were almost universally agreed. After the restoration, Mr. Baillie was appointed, in 1661, principal of the university of Glasgow; but it is said that a bishopric was offered him, which he absolutely refused. In the course of the year 1662, his health began to decline: and during his illness he was visited by the newly created archbishop of Glasgow, whom he addressed in the following uncourteous language: "Mr. Andrew (I will not call you my lord), king Charles would have made me one of these lords; but I do not find in the New Testament that Christ has any lords in his house." In July of this year Mr. Baillie died at the age of sixty-three years. His character was not more distinguished by his loyalty, than by his zeal for presbytery, and his averseion to prelacy; and he seems to have been actuated, in a very considerable degree, by the intolerant spirit of the age in which he lived. In his letters, he every where manifests his dislike of sectaries; and he hardly omits any convenient opportunity of shewing his disapprobation of the doctrine of toleration. He had also imputed a considerable portion of that enthusiasm.
spirit which was then prevalent, and which protracted the religious services to an astonishmng length. Accordingly, Mr. Baillie, in one of his letters, written whilst he was attending the Westminster assembly, speaks of a devotional service that lasted nine hours. Nevertheless, he was a man of considerable learning and ability; he is said to have understood twelve or thirteen languages; and Mr. Wodrow, his biographer, commends his Latin style as not unsuited even to the Augustan age. Of his diligence and learning, he left sufficient evidence in his historical work, intituled, "Opus Historiae et Chronologicum." His other writings, which were chiefly on controversial and temporary subjects, and which indicated a degree of violence that is said to have flowed rather from the infltration of other persons than from his own inclinations, are of inferior value. His "Letters and Journals," published at Edinburgh by Robert Aiken, in 1755, in two volumes 8vo., contain an account of public transactions, both in Scotland and England, from 1637 to 1662, and may call for light on the civil and ecclesiastical history of that period. Bigh. Brit.

BAILORE, in Heraldry, is a lion rampant, holding a baton in its mouth.

BAILLOU, Guillaume de (Balliuus), M. D., a physician of considerable eminence in the sixteenth century, was born at Paris in the year 1538. After making great progress in the Greek and Latin languages, and in philosophy, he applied to the study of medicine. In 1570, he was created doctor; and in the year 1578, dean of the faculty of medicine at Paris. In his time the dispute between the surgeons and physicians at Paris, as to their precedence, began, in which Ballonius took an active part. It was decided in favour of the physicians, and the privileges usurped by the surgeons annulled. Ballonius was a voluminous writer; but as his works are now little noticed, we shall refer our readers, for titles of the particular treatises, and for an account of their contents, to Haller's Bib. Med. Prac.

BAILLY, Jean-Sylvain, a celebrated astronomer and writer of France, was born at Paris, on the fifteenth of September 1736, of a family which had produced distinguished painters for four successive generations. He was bred to the fame profecition, but manifested an early taste for poetry and the belles lettres. By an accidental acquaintance with La Caille, his attention was directed to the sciences, which he cultivated with affability and facility. He calculated the orbit of the comet of 1759; and in 1763 he published an useful and elaborate compilation, being the reduction of the observations made by La Caille in 1760 and 1761, on the zodiacal stars. About this time the theory of Jupiter's satellites became a particular object of his inquiries, and in the competition for this prize question of 1764, he had a formidable rival in La Grange, afterwards known as one of the first mathematicians in Europe. The results of his investigations were collected into a treatise, published in 1766, which also contained the first part of his "History of Astronomy." In 1771, he gave a very curious and important memoir on the light of the satellites, and introduced a degree of accuracy till that time unknown in the observations of their eclipses; and in the Journal Encyclopédique for May and July 1773, he addressed a letter to M. Bernouilli on some discoveries relating to Jupiter's moons, which he had contrived. However, the studies of M. Bailly were not confined to the abstract sciences; but he was no less successful in his cultivation of polite literature. His elegy of Leibnitz, published in 1766, gained the prize of the academy of Berlin; this, and also the elegies of Charles V., of Corinelle, of La Caille, of Cook, of Moller, and of Grellet, printed in 1779, were much admired. In 1775, appeared the first volume of the "History of Astronomy," which indeed drew a path of science with flowers, and in every respect is a most valuable work; abounding with animated description, luminous narrative, and interesting detail. His peculiar ideas concerning the early date of Upper Asia, occasioned an ingenious correspondence and discussion with the veteran philosopher Voltaire, the substance of which soon appeared in two volumes, intituled, "Letters on the Origin of Sciences," and "Letters on the Atlantide of Plato." If imagination shine forth in these essays, erudition was no less conspicuous in a great work composed in the years 1781 and 1782, on the fables and religious creeds of antiquity; which still exists in manuscript, and the publication of which would extend the fame of its author, and gratify the learned world. His opinions on some points happening to coincide with the theories of Buffon, he contracted with that celebrated naturalist an intimate friendship, which was dissolved by Bailly's uncourteous opposition to the election of the abbé Mauri into the académie Française. The other volumes of the "History of Astronomy" successively appeared, and that capital work was completed in 1797, by the "History of the Indian and Oriental Astronomy," a production of singular acuteness, research, and nice calculation. His "Discours and Memoirs," which include the eloge before mentioned, were published in two volumes, in 1796; and his memoirs communicated to the French academy, as they appear in Rojer's index, are as follows: "Memorial upon the theory of the comet of 1759," "Memoir upon the epochs of the moon's motions, at the end of the last century," "First, Second, and Third Memoirs on the theory of Jupiter's satellites, 1763," "Memoir on the comet of 1762," vol. for 1763; "Astronomical observations made at Nolm, 1764;" "On the sun's eclipse of the frill of April 1764;" "On the longitude of Nolm, 1764;" "Observations made at the Louvre from 1760 to 1764, 1765;" "On the cause of the variation of the inclination of the orbit of Jupiter's second satellite, 1756;" "On the motion of the Nodes, and on the variation of the inclination of Jupiter's satellites, 1766;" "On the theory of Jupiter's satellites, published by M. Bailly, with tables of their motions, and of those of Jupiter, published by M. Jeanrat, 1766;" "Observations on the opposition of the sun and Jupiter, 1768;" "On the equation of Jupiter's centre, and on some other elements of the theory of that planet, 1768;" "On the transit of Venus over the sun, on the third of June 1769; and on the solar eclipse, the fourth of June, the same year 1769;" "On the theory of Jupiter's satellites, published by M. Bailly, with tables of their motions, and of those of Jupiter, published by M. Jeanrat, 1766;" "Observations on the opposition of the sun and Jupiter, 1768;" "On the equation of Jupiter's centre, and on some other elements of the theory of that planet, 1768;" "On the transit of Venus over the sun, on the third of June 1769; and on the solar eclipse, the fourth of June, the same year 1769;"

Such was the reputation of Bailly, that he was received as an adjunct in the French academy, on the 29th of January 1753, and admitted to the 14th of July 1778. In 1771, he was a candidate, under the patronage of Buffon, for the office of secretary; but the interest of Condorcet, and the influence of D'Alembert, prevailed in favour of Condorcet. Of the académie Française, he was chosen secretary in 1754; and he was admitted, in the following year, into the Academy of Inscriptions and Belles Lettres; the only influence, since Fontenelle, of the same person being at once a member of all the three academies. In 1784, he was nominated one of the commission to examine and report concerning the animal magnetism of Meiner, as practised by Delon. His report was not only decisive with regard to its object, but furnishes a rule for the investigation of similar delusions. It likewise throws light upon the physical effects produced by moral causes; and these are peculiarly interesting, as causes of this nature have a political influence on the general opinions of society, and the destiny of nations.

M. Bailly, with an ardent, and, as it is generally believed, an honied mind, engaged in the support of that revolution of France, which at the time consumed Europe, and which, with regard to its consequences, has not yet subsided. His
ribe, as a principal agent in the transactions of this event, was very rapid. On the 26th of April 1790, he was nominated secretary by the doctors of Paris; he was afterwards appointed deputy to the state general; then chosen president of the "Tiers État;" and when this chamber was constituted the national assembly, he continued the chair. During the struggle between the popular part of the habitating assemblies and the court, Bailly was the most forward to assert the popular rights; at that time were new in France; and his temerity would probably have been fatal to himself; if he had not been supported by Mirabeau. Bailly dedicated the oath to the members of the tiers état, "to repel tyrants and tyranny, and never to separate, until they had obtained a free constitution." After the capture of the Bastille, on the 14th of July 1789, he was appointed by public acclamation mayor of the city, and in all his several functions he is said to have acted with integrity, courage, and moderation. But in the midst of revolutions the cause by which he professed was adapted to please neither of the contending parties; and though he acquired great popularity in the various steps by which the cause of the people gained predominance over that of the court, acircumstance occurred, which gave a turn to the popular opinion, and which rendered him an object of invective enmity. On the 17th of July 1790, the populace having collected tumultuously to demand the abdication of monarchy, Bailly received orders from the national assembly to disperse the mob. Deliberating that the existing laws and regulations should be respected; he arrested certain deputies who came from some military insurgents at Nancy; he opposed the rash proceedings of Mauv and Hubert; he was member of a club his followers in its admission of members then that of the Jacobins; and he exerted himself in endeavouring to persuade the populace to permit the royal family to depart to St. Cloud. Finally, on an occasion when the multitude assaulted the soldiery in the Champ de Mars, Bailly ordered the latter to fire, by which about forty persons were killed, and more than one hundred wounded. By these occurring circumstances his popularity declined, and at the dissolution of the constituent assembly, in the close of the year 1791, he resigned his office, and was succeeded by Petion. His health was impaired, and he retired from the scene of tumult, travelled through different provinces of France in the years 1792 and 1793; and pursued his literary and scientific researches. During this period, he wrote memoirs of the events which he had witnessed, and in which he had been a principal actor. Instead of withdrawing from France, which some of his friends advised him to do, he chose rather to submit to the injustice and ingratitude of his country. At the age of a vulgar tyrant, he was arrested, summarily condemned by a fragmentary tribunal, and, on the 15th of November 1792, was delivered over to appease the vengeance of an incensed and indiscriminating populace. His sufferings were indignantly protracted; circumstances of peculiar ignominy attended his execution; and he was executed near the spot where he gave orders for the military to fire on the people. He wore the red shirt, or badge of conspiracy, and was placed in a cart, with his hands tied behind him. In his progress to the place of execution, he was insulted and abused; and when he arrived at the fatal spot, during the removal of the guillotine, he was forced to descend from the cart, and to walk round the field, in order to gratify more completely the rancour of the mob. But all these trials were endured by him with firmness and magnanimity. A by-stander, at the time of his ascending the platform, infamously exclaimed, "Bailly, you tremble!" to which he faintly replied, "Yes, but not with fear," he shook indeed on account of the imminence of the weather. The character of Bailly, thus prematurely cut off in the fifty-seventh year of his age, may be estimated by his works. In his person he was tall; his deportment was sedate and grave; and he blended firmness with facility. During his magistracy, he spent part of his fortune in relieving the wants of the poor; nay he retired from office, impoverished rather than enriched; and in the various transactions of his life, he established the character of integrity and disinterestedness. His wife, who was the widow of his intimate friend Raymond Guye, and whom he married in 1787, survived him. He had eight nephews, whom he educated with all the attention and tenderness of a father. With regard to the motives which actuated his public conduct, there seems to be no difference of opinion, whatever discordant sentiments may be entertained concerning the cause to which his talents and life were devoted. Lalande's Eloge de Bailly. BAILLY, or BAILLIE, &c. la Revine, physician to King Henry IV., was born at Falaise in Normandy, about the middle of the sixteenth century. He was a distinguished advocate for the doctrines of Paracelsus, and in 1578 he published his "Democritian, or Aphorisms etc. continues summam doctrinam Paracelsiana," 8vo. Paris. It contains a defence of his practice, which being strongly opposed by the cotemporary physicians, in the following year he gave his "Reposicio ad quaestionem propositam Medicis Paracelsianus," also in 8vo. In 1580, he published "De peste tractatus," 8vo. Voces viri, Haller says, vex fenum admittat. We shall omit the titles of his various other writings, which may be found recited in Haller's Eth. Med. Pract. vol. ii. p. 218.

Moral. Carrere says of this physician, that perceiving he was about to die, he called his servants to him singly, and gave to each of them a portion of his money, then of his plate and furniture, bidding them, as soon as they had taken what he had given, to leave the house, and see him no more. When the physicians came to visit him, they told him they had found his door open, and the servants and the furniture removed and gone, nothing in fact remaining but the bed on which he lay. Then the doctor, taking leave of his physicians, said, since his baggage was packed up and gone, it was time that he should go also. He died the same day, November the 5th, 1605. Elyo Dict. Hist.

BAILEMENT, from Fr. bailler, to deliver, in Law, is a delivery of goods in trust, upon a contract express or implied that the trust shall be faithfully executed on the part of the bailer, a person to whom they are delivered; and the goods re-delivered as soon as the time or use for which they were bailed shall have elapsed or be performed. There are six sorts of bailments, which devolve a care and obligation on the party to whom goods are bailed; and which consequently subject him to an action, if he behave with regard to the trust repose in him.

1. A bare and naked bailment, to keep for the use of the bailer, which is called depofium; and such bailor is not chargeable for a common neglect, but it must be a good one to make him liable.

2. A delivery of goods which are useful to keep, and they are to be returned again in specie, which is called accommodation, or a lending gratis; and in such case the borrower is strictly bound to keep them; for if he be guilty of the least neglect, he shall be answerable, but he shall not be charged where there is no default in him.

3. A delivery of goods for hire, called lauris or conditio; and the hirer is to take all imaginable care, and restore them at the time, and if he use such care, he shall not be bound.
B A I

4. A delivery by way of pledge, called pawn, and in such goods the pawnee has a special property; and if the goods be the worfe for using, the pawnee must not use them; otherwise he may use them at his peril; as jewels pawned to a lady, if the keep them in a bag, and they are stolen, she shall not be charged; but if she go with them to a play, and they are stolen, she shall be answerable. If the pawnee be at a charge in keeping them, he may use them for his reasonable charge; but if, notwithstanding all his diligence, he lose the pledge, yet he shall recover the debt. But if he lose it after the money tendered, he shall be chargeable, for he is a wrong-doer; after money paid (and tender and refusal is the same) it ceases to be a pledge, and therefore the pawnor may either bring an action of assumpsit, and declare that the defendant promised to return the goods upon requell; or trover, the property being vested in him by the tender. 5. A delivery of goods to be carried for a reward. (See Carrier.) 6. A delivery of goods to do some act about them (as to carry) without a reward, called by Bracton mandatum, in English, an acting by commission; and though he get nothing for his pains, yet if there were any neglect in him, he will be answerable, for his having undertaken a thing in sufficient consideration; but if the goods be misused by a third person, in the way, without any neglect of his, he will not be liable, being to have no reward.

On this subject, sir William Jones’s "Essay on the Law of Bailment" merits particular attention; and the following analysis will convey much knowledge in a short compass.

"Definitions. 1. Bailment, as before at the beginning of this article. 2. Deposit is a bailment of goods to be kept for the bailor without recompence. 3. Mandate is a bailment of goods, without reward, to be carried from place to place, or to have some act performed about them. 4. Leasing for use is a bailment of a thing for a certain time, to be used by the borrower without paying for it. 5. Pledging, is a bailment of goods by a debtor to his creditor, to be kept till the debt be discharged. 6. Letting to hire is (1) a bailment of a thing to be used by the hirer for a compensation in money; or (2) a letting out of work; and labour to be done, or care and attention to be bestowed, by the bailee on the goods bailed, and that for a pecuniary recompence; or (3) of care and pains in carrying the things delivered from one place to another, for a stipulated or implied reward. 7. Immovable bailements are those where the compensation for the use of a thing, or for labour and attention is not pecuniary; but either (1) the reciprocal use or the gift of some other thing; or (2) work and pains reciprocally undertaken; or (3) the use or gift of another thing in consideration of care and labour; and conversely. 8. Ordinary neglect, is the omission of that care, which every man of common prudence, and capable of governing a family, takes of his own concerns. 9. Gross neglect, is the want of that care which every man of common sense, how inattentive forever, takes of his own property. 10. Slight neglect is the omission of that diligence which very circumspect and thoughtful persons use in securing their own goods and chattels. 11. A naked contract is a contract made without consideration or recompense."

"II. The rules which may be considered as axioms flowing from natural reason, good morals, and found policy, are these. 1. A bailee who derives no benefit from his undertaking, is responsible only for gross neglect. 2. A bailee who alone receives benefit from the bailment, is responsible for slight neglect. 3. When the bailment is beneficial to both parties, the bailee must answer for ordinary neglect. 4. A special agreement of any bailee to answer for more or less, is in general valid. 5. All bailees are answerable for actual fraud, even though the contrary be conjectured. 6. No bailee shall be charged for a loss by inevitable accident or irresistible force, except by special agreement. 7. Robbery by force is considered as irresistible; but a loss by private theft is presumptive evidence of ordinary neglect. 8. Gross neglect is a violation of good faith. 9. No action lies to compel performance of a naked contract. 10. A repARATION may be obtained by suit for every damage occasioned by an injury. 11. The negligence of a servant, acting by his master's express or implied order, is the negligence of the master."

"III. From these rules the following propositions are evidently deducible. 1. A depository is responsible only for gross neglect; or, in other words, a violation of good faith. 2. A depository, whole character is known to his depositor, shall not answer for mere neglect, if he take no better care of his own goods, and they also be spoiled or destroyed. 3. A mandatory to carry is responsible only for gross neglect, or a breach of good faith. 4. A mandator to perform a work is bound to use a degree of diligence adequate to the performance of it. 5. A man cannot be compelled by action to perform his promise of engaging in a deposit or mandate; but,—6. A repARATION may be obtained by suit for damage occasioned by the non-performance of a promise to become a depository, or a mandatory. 7. A borrower for use is responsible for flight negligence. 8. A pawnee is responsible for ordinary neglect. 9. The hirer of a thing is answerable for ordinary neglect. 10. A workman for hire must answer for ordinary neglect of the goods bailed, and must apply a degree of skill equal to his undertaking. 11. A letter to hire of his care and attention, is responsible for ordinary negligence. 12. A carrier for hire by land or by water is answerable for ordinary neglect."

"IV. Exceptions to the above rules and propositions. 1. A man who spontaneously and officiously engages to keep or to carry the goods of another, though without reward, must answer for flight negligence. 2. If a man through strong persuasion and with reluctance undertake the execution of a mandate, no more can be required of him than a fair exertion of his ability. 3. All bailees become responsible for losses by casualty or violence, after their refusal to return the things bailed; on a lawful demand. 4. A borrower and a hirer are answerable in all events, if they keep the things borrowed or hired after the stipulated time, or use them differently from their agreement. 5. A depository and a pawnee are answerable in all events if they use the things deposited or pawned. 6. An inn-keeper is chargeable for the goods of his guest within his inn, if the guests be robbed by the servants or inmates of the keeper. 7. A common carrier by land or by water must indemnify the owner of the goods carried, if he be robbed of them."

"V. It is no exception, but a corollary from the rules, that every bailee is responsible for a loss by accident or force, however inevitable or irresistible; if it be occasioned by that degree of negligence for which the nature of his contract makes him generally answerable."

The following cases may serve to illustrate the above principles.

A man leaves a chest locked up with another to be kept, and doth not make known to him what is therein; if the chest and goods in it are stolen, the person who received them shall not be charged for the same, for he was not trusted with them. And what is said as to stealing is to be understood of all other inevitable accidents; but it is necessary for a man that receives goods to be kept, to receive them in a special manner, viz. to be kept as his own, or at the peril of
BAI

of the owner. 1 Litt. Abr. 193, 194. And vide 1 Rol. Abr. 238. 2 Show. pl. 166.

If I deliver to A. to buy cattle, and he beflows gol. of it in cattle, and I bring an action of debt for all, I shall be barred in that action for the money bestowed and charges, &c. but for the rent I shall recover. Hob. 207.

If one deliver his goods to another person, to deliver over to a stranger; the deliverer may countenanc his power, and require the goods again; and if the bailee refuse to deliver them, he may have an action of account for them. Co. Litt. 286.

If A. delivers goods to B. to be delivered over to C. hath the property, and C. hath the action against B. for B. undertakes for the safe delivery to C. and hath no property or interest but in order to that purpose. 1 Rol. Abr. 665. see 1 Bulst. 68, 69. where it is said that in case of conversion to his own use, the bailee shall be answerable to both.

But if the bailement were not on valuable consideration, the delivery is countenancable; and in that case, if A. the bailor bring trover, he reduces the property again in himself, for the action amounts to a countenanc; but if the delivery was on a valuable consideration, then A. cannot have trover, because the property is altered; and in trover the property must be proved in the plaintiff. 1 Bulst. 68; see 1 Leon. 30.

And where a man delivers goods to another to be re-delivered to the deliverer at such a day, and before that day the bailee dott sell the goods in market ovet; the bailor may at the day feixe and take his goods, for the property is not altered. Godb. 160.

If A. borrows a horse to ride to Dover, and he rides out of his way, and the owner of the horse meets him, he cannot take the horse from him; for A. has a special property in the horse till the journey is determined; and being in lawful possession of the horse, the owner cannot violently seize and take it away; for the continuance of all property is to be taken from the form of the original bargain, which in this case was limited till the appointed journey was finished. Yelv. 172. But the owner may have an action on the cafe against the bailee for exceeding the purposes of the loan; for so far it is a secret and fallacious abuse of his property; but no general action of trespass, because it is not an open and violent invasion of it. 1 Rol. Rep. 128.

As to borrowing a thing perilable, as corn, wine, or money, or the like, a man must, from the nature of the thing, have an absolute property in them; otherwise it could not supply the uses for which it was lent; and therefore he is obliged to return something of the same sort, the same in quantity and quality with what is borrowed. Dr. & Stud. 170.

But if one lend a horse, &c. he must have the fame re-

ferred. If a thing lent for use be suffered to any other end or purpose than that for which it was borrowed, the party may have his action on the cafe for it, though the thing be never the worse; and if what is borrowed be lost, although it be not by any negligence of the borrower, as if he be robbed of it; or where the thing is impaired or destroyed by his neglect, admitting that he put it to no more service than that for which borrowed, he must make it good; so where one borrows a horse, and puts him in an old rotten horse ready to fall, which falls on and kills him, the borrower must answer for the horse. But if such goods borrowed perish by the act of God (or rather, as Sir William Jones says, it ought more reverentially to be termed, by inevitable accident), in the right use of them; as where the borrower puts the horse, &c. in a strong house, and it falls and kills him, or it dies by disease, or by default of the owner, the borrower shall not be charged. 1 Infr. 89. 29 Aff. 28.

If one delivers a ring to another to keep, and he breaks and converts the same to his own use; or if I deliver my sheep to another to be kept, and he suffers them to be drowned by his negligence; or if the bailee of a horse, or goods, &c. kill or spoil them, in these cases action will lie. 5 Rep. 13. 15 E. 4. 20b. 12 E. 4. 13.

If a man deliver goods to another, the bailee shall have a general action of trespass against a stranger, because he is answerable over to the bailor; for a man ought not to be charged with an injury to another, without being able to retire to the original cause of that injury, and in amendment there to do himself right. 13 Co. 69. 14 H. 4. 28. 25 H. 7. 14. See Jacob's Law Dictionarv by Tomlinis, art. Bailment. Blackft. Com. vol. ii. p. 356. 451. &c.

BAILO, or BAILE, a name given at Conflantinople to the ambaffador of Venice residing at the Porte, who also does the office of conful of his nation.

The word is doubtfuf the remins of the word hofjar, which the modern Greeks and Turks have formed into baiio.

The Venetian confuls at Aleppo, Alexandria, Smyrna, and other parts of the Levant, are also denominated baiio.

BAILYBOROUGH, in Geography, a market and poft town of the county of Cavan in Ireland, which, though of very mean appearance, has an excellent market. The crops in its vicinity consist of potatoes, flax, and oats, and are very poor. There is a black-green contiguous to the town, and there are some small farmers in the neighbourhood, who make butter for market, which is sent to Neney for exportation. Their pigs, which form a considerable article of trade, are sent to the same place. This town has been hitherto very much neglected; but such are its advantages of situation, that if any encouragement were given, it might be easily raised to a state of prosperity and confequence. Between this town and King's Court is a lake, or rather pool, on the summit of a mountain, which is celebrated for its anticoberute virtues, and is much frequented from June to August. Many bathe in the lake; but the mud, which is taken up from the depth of thirty feet, and rubbed on the affected parts, is deemed the most efficacious. This mud is a greatly liming subfance like tar. The lake covers about half a square good in area, and has a range of lofty hills to the east and west. For about six feet from the surface the water is pure and clear, with something of a callybate taste. It is observed of it, that the sun or atmosphere has no effect either in impor-
near the southern bank of the Nile, and runs southward through the heart of Egypt; and after a course of 400 miles mix-\-s with the Godavary, within the hills that bound our northern circuit, about ninety miles above the sea. It is not certain how far the Pain Ganga is navigable; but it is mentioned as a large river in the early part of its course; and is probably equal in bulk to the Godavary, when it joins it. Rapee's Spec. p. 246.

BAINBRIDGE, John, in Biography, an eminent physician and alchemist, was born at Adysh de la Zouche, in Staffordshire, in 1612, finished his education at Emmanuel college, in the university of Cambridge, and then returned to his own county, where for some years he taught a grammar school, and practiced physic. He also applied himself to the study of mathematics and astronomy, to which he had been devoted from his early years. Upon his removal to London, he was admitted a fellow of the college of physicians. His "Description of the comet" in 1613, introduced him to an acquaintance with Sir Henry Savile, by whom he was appointed, in 1619, his first professor of astronomy at Oxford, where he felt the entering himself a master commoner of Milton college, for some years. At the age of forty years he began the study of Arabic, with a view of publishing correct editions of the ancient astronomers. He died at Oxford, November the 30th, 1643, in the sixty-third year of his age. His works that were published are: "An Astronomical Description of the late comet from November 16th, 1613, to the 15th of December following," London, 1619. 4to; "Procli Sphaerae" and "Ptolemei de hypothecibus Planetarum liber fingulares," to which he added Ptolemy's "Canon regorum," 1620. 4to; "Canuncaria," published at Oxford, in 1648, by Mr. Grevius, together with a demonstration of the heliacal rising of Sirius or the dog-star for the parallel of Lower Egypt, written at the request of archbishop Usher. Several other treatises were prepared for the press, and left in MS. Biog. Brit.

BAINDER, in Geography, a town of Asiatic Turkey, in the province of Natalia, forty-four miles east from Baalbek.

BAINDT, a town of Germany, in the circle of Swabia, fix miles N.N.E. of Ravnspurg.

BAINt, a river of England, in Lincolnshire, which passes by Horncastle, Tatterhall, &c., and joins the Witham near the left-mentioned place.

BAINETTA, a town of Piedmont, in the province of Cuneo, on the Orlogio, six miles S. E. from Cuneo, and eight W. S. W. from Monday, in Pertine.

BAINS, a town of France, in the department of the Voges, and chief place of a canton in the district of Darcy; 24 leagues west of Plombieres, and 54 south-east of Darcy.

BAIOCCHO, in Commerce, a copper coin in modern Rome, equivalent to a tenth part of the lira, or a hundredth part of the ducat.

The basiocco is worth about nine deniers, French money.

BAIJOLE, Cape, in Geography, the most northerly cape of Minorca island, in the Mediterranean, ten leagues from the most northerly cape of the island of Majorca.

BAIPLA, a town of North America, in New Navarre, 15 miles south-west from Cafa Grand.

BAIRAM, a name given to the great annual feast of the Mahometans.

The word is also written, by some authors, more conformably to the oriental orthography, bellarn. It is originally Turkish, and signifies literally, a fast-day, or holiday.

The Mahometans have two baisams, the great and the little, which Scaliger, Euphranius, Rycruit, Hyde, Chardin, Babronus, and other European writers, commonly interchange, giving the appellation great to that which the Turks call tile, and vice versa.

This feast commencing with the new moon, the Mahometans are very exact in observing the time when the new moon commences, and which purpose, observers are sent to the tops of the high mountains, who, the moment they spy the appearance of a new moon, run to the city, and proclaim resplendens, ancient news; as it is the signal for beginning the feast.

The ceremonies are described at large by Rycraft and Tournefet.

BAIYAN, the Greater, is properly that held by the pilgrims at Mecca, commencing on the tenth of Dhu'l-Hijjah, which the Moors are fond, and lasting three days. This is called by the Arabs, el al korban, el elKal, that is, the feast of the sacrifices, as being celebrated in memory of the sacrifice of Abraham, whose son, Isa, was accorded with a great victim. By European writers it is called the Iftar benaram, as being left taken notice of by the generalty of the people, who are not struck with it, because the ceremonies attending it are performed at Mecca, the only scene of the solemnity.

The Iftar benaram is called in Arabic Ifta al Fait, that is, the feast of breaking the fast, and begins the first of Shawal, immediately succeeding the fall of Ramadan. This is called by the vulgar, and by most other writers who have written of the Mahometan affairs, the greater benaram, because it is observed in an extraordinary manner, and lasts for three days at Constantinople and in other parts of Turkey, and for five or six days in Perisa, during which no work is done; but presents pass from one to another, with many other manifestations of joy. If the day after Ramadan should prove cloudy as to prevent the sight of the new moon, the benaram is put off till the next day, when it begins; though the moon be still obscured. When they celebrate this feast, after numerous ceremonies, or rather strange mimeries, in their mosques, they end it with a solemn prayer against the hideks, to root out Christian princes, or to arm them one against another, that they may have an opportunity to extend the borders of their law.

Sale's Pred. Diff. p. 150.

BAIRDSTOWN, or BEARDS'TOWN, in Geography, a flourishing town of America, in Nelson county, Kentucky, containing 216 inhabitants, seated on the head-waters of Salt-river, fifty miles S. E. from Louisville, and about the same distance S. W. from Danville.

BAI'OULT, as it is pronounced by the Arabs, and as the modern Greeks pronounce Esghi, Belaou, or the ancient Berytus, a town of Syria, in the pashalic of Sidc or Aeros, is situated in a plain, which runs out from the foot of Mount Lebanon into the sea, narrowing to a point about two leagues from the ordinary level of the shore, and on the mouth side forms a pretty long road, receiving the river of Nabul-Salih, called also Nahar-Baout. The frequent floods to which this river is subject in winter, have occasioned the erection of a considerable bridge; but this is in a ruinous a state as to be impassable. The bottom of the road is rocky, which chafes the cables, and renders it insecure. The town of Baaut, which lies about an hour's journey westward towards the point, I clung till of late to the Druses, but Djezzar took it from them, and placed in it a Turkish garrison. It still continues, however, to be the emporium of the Maronites and the Druses, where they export their cottons and their silk, altho all of which are sent to Cairo. In return, they receive rice, tobacco, coffee, and specie, which they exchange again for the corn of the Bekaa and the
the Hauran. This commerce maintains near 6000 persons.

The deceit of the inhabitants is the most corrupt of any in the country; and it is said to unite in itself the twelve faults enumerated by the Arabian grammarians. The port of Baira, formed like all the others on the coast by a pier, is, like them, choked up with sand and ruins. The town is surrounded by a wall, the last and only float of which may be pierced by a cannon-ball, without breaking or crumbling; in other respects this wall, and its old towers, are defences.

Baira is subject to two inconveniences, which will always prevent its becoming a strong place; for it is commanded by a chain of hills to the south-call, and it is altogether deficient of water, which is fetched by the women at the distance of half a quarter of a league, and even this is but indifferent. Djereza has undertaken to construct a public fountain, as he has done at Acre; but the cauld will soon become useless. In digging, in order to form reservoirs, fabulous ruins have been discovered, from which it appears that the modern town is built on the site of the ancient Berytus; and without the wall, towards the sea, heaps of rubbish and shafts of columns indicate that Berytus has formerly been much larger than it is at present. The site around it is entirely planted with white mulberry trees, which are young and flourishing, and therefore the silk produced here is of the finest quality. In descending from the mountains, the verdure formed by the tops of these trees in the dilapidated bottom of the valley exhibits a very delightful prospect. The heat, and the warmth of the water, render Baira in summer an inconvenient place of residence; the town, however, is not unhealthy; more especially since the emir Fakr-ed-din has planted a wood of fir trees about a league southward of the town. Volney's Travels in Egypt and Syria, vol. ii. p. 187, &c. See BERYTUS.

BAISE, a river of France, which runs into the Garonne, near Aigunon.

BAIT, White, in Ichthyology, a small fish, which is caught in great plenty, from August 1, to October 1, by flat. 30 Geo. II. c. 21, in the river Thames. See WHITE BAIT.

BAIT, in Fishing. Baits make a capital article in angling; on the choice whereof much of the sport depends; different seasons, and different game, having their appropriate baits. The red, or earth-worm, is good for the small fry most of the year round; and small fish are good baits for pikes at all times; sheep's blood and cheese are good bait in April; the boeuf, dried wafps, and bees, are for May; brown flies for June; maggots, hornets, wafps, and bees, for July; fish in August; grasshoppers in September; corn, bramble-berries, and fields, at the fall of the leaf; artificial baits are for May, June, July, and frogs for March.

Baits are either natural or artificial.

Baits, Natural, include all kinds of worms, as the red worm, maggots, &c. also frogs, grasshoppers, hornets, bees, snails, roaches, blow, gnats, and locusts. &c.

These baits are to be kept each separate, and fed with those things which they like best.

The red worm is to be kept in rich black mould, with a little funnel chomped among it; a little ox or cow dung, newly made, is also a very acceptable thing to them. They may be kept in a box, with small holes in it, or in a bag. Red worms, and all other sorts, Seem quickly, and grow very tough and bright, on putting them into a thin clove, greased with fresh butter, or greafe, before they are put into moats.

This is the beer of all things to keep them in; but the moat must be first very well washed, and the water squeezed out again. As to food, a spoonful of cream, dropped into the moat once in three or four days, is better than any thing else. The moats is to changed every week, and kept in a cool place.

White large maggots are an excellent bait for many sorts of fish, and they are to be kept on sheep's feet and liver chopp'd in hot.

Hogs and grasshoppers are to be kept in wet moats, and long grass; and on moistening this air they will keep a long time. They are to have their legs and wings cut off when they are used.

Live flies must be used as they are caught; but wafps, bees, hornets, and humble-bees, may be preferred dry. The best method of drying them, is putting them in an oven after the bread is drawn. Care must be taken that they are not firstched; and when they are taken out they are to have the heads dipped in sheep's blood. This is to be suffered to dry on, and then they are to be preferred in a box. They will keep for three or four months. See ANGLING.

Baits, Artificial, are flies of all kinds and shapes, made of silk, feathers, and the like. The variety of these is very great; there being not only different ones for every season and month in the year, but almost for every fish. See ANGLING.

There are several artificial baits, for enticing of bough, and yet without tantalising or hurting the fish, so as to make it un-able.

Baits, Dead, are piles of divers sorts, made of corn, cheese, fruit, wafps, sheep's blood, boiled beans, &c. See ANGLING.

Bait, Ground. See ANGLING.

Bait, Ledger, is that which remains fixed in one certain place, while the angler may be absent; esp. in fishing for pike.

Bait, Walking, is that which the angler attends while he keeps moving from place to place, in quest of the fish.

Baits of Hemp, denote bundles of that plant, pulled and tied up, ready for deeping in water. See Fly-Fishing.

BAIT-EL-LAHAM, the ancient Bethelhem, in Geography, a town of Syria, in the pacelie of Damascus, is a village about two leagues south-east of Jerusalem, seated on an eminence in a country full of hills and vallies. The adjacent soil is the belt in all these districts; so that fruits, vines, olives, and sennaum, succeed here extremely well; and nothing is wanting but cultivation. They reckon about 600 men in this village capable of occasionally bearing arms; and occasions of this kind frequently occur, sometimes to refrain the pacha. Sometimes to make war with the adjoining villages; and sometimes in consequence of intestine divisions. Of these 600 men, about 100 are Latin Christians, who have a vicar dependent on the great convent at Jerusalem. The whole trade formerly confined in the manufacture of beads; but not finding a sufficient vent for them, they have refixed the cultivation of their lands. They make a white wine, which justifies the former celebrity of the wines of Judaea, but it has the property of being very heavy. The necessity of uniting for their common defence prevails over their religious differences, and induces the Christians here to live in tolerable harmony with their fellow-citizens the Mahometans. Both are of the party of Tamar, which, with its opposite called Keify, divides the whole of Palestine into two factions that are perpetually at variance. The courage of these peasants has been frequently tried, and renders them formidable through the whole country. Volney's Travels, vol. ii. p. 323. See BETHELHEM.

BAITHUSUS, in Biography, a Jewish teacher, and one of the founders of the sect of the Sadducees, flourished in Judea,
BAJULATIO, the office of a bajulus or bailiff.

Bajulus, an ancient officer in the court of the Greek emperors; whereof there were several degrees: as the grand bajulus, who was preceptor of the emperor, and the simple bajuli, who were sub-preceptors.

Hence the Italians use the word bajulus of a kingdom in the same sense with protector of a kingdom among the English. The word is derived from the Latin verb bajulare, to carry, or bear a thing on the arms, or on the shoulder.

Children, and especially those of condition, bad anciently, beside their nurse, a woman called gersul, as appears from several passages of Tertullian; when weaned, or ready to be weaned, they had men to carry them about to take care of them, who were called gersuli, and legule, air gerenda & bajulando.

Bajulus is also used by Latin writers in the several other senses wherein bailiff is used among us.

Bajulus was also the name of a conventual officer in the ancient monasteries, to whom belonged the charge of gathering and distributing the money and legacies left for masses and obits: whence he was also deminimissed bajulus obitanum novorum.

Bajulus, in Entomology, a species of Ceratbyx (Cylindrum) that is found in the trunks of trees in the northern parts of Europe. The thorax is villous, with two tubercles; body brown. Fabricius. This is ceratbyx cuadnus of Degeer; and leptura bajula of Scopoli. Gmelin.—Of a variety of this species (3) is described by Linnaeus. Fa. Succ. i. p. 450. The colour of which is tchaffa: thorax cinereous, and villous, with two little glabrous lines; in the Fabrician monstifin. Another variety (γ) is noticed: it is a native of Saxony, and only half the size of the former.

Baius, Michael, in Biography, a professor of divinity at Louvain, was born at Melin, in the territory of Aeth, in the year 1513, and educated in the university of Louvain; where he was elected, in 1541, principal of one of the colleges; and in 1544, lecturer in philosophy. In 1550 he took his doctor's degree, and was appointed professor of the holy scriptures. Baius and his associate having adopted the tenets of Luther, and appealing to the authority of Augustin, taught doctrines concerning grace and free-will, contrary to those which had been commonly received in the church of Rome. The complaint of heresy was excited; Baius was accused as a chief instrument of promoting it; and the doctors of the Sorbonne at Paris pronounced a sentence of censure. The clamour against him was circulated; and a number of propositions, collected from books published by him in 1561 and 1564, were transmitted in 1567 to pope Pius IV. The pope issued a bull condemning these propositions; but without mentioning the name of the author, and adding a kind of ambiguous clause, which seemed to intimate, that some of the propositions which he condemned, admitted of a favourable construction. By these measures of policy, suggested by the experience of the evils that had arisen from pursuing a more intemperate conduct with regard to Luther, the perfon of Baius was exempted from the penalties of ex-
BAK

communication, and he continued to exercise his functions, and even to vindicate his doctrines; whilst he solicited the pope to absolve the irregularity. About thirteen years after this transfiguration, complaints against Bains were renewed; and Pope Gregory XIII., at the mitigation of the Jesuits, confirmed the sentence of Pius IV. Bains quietly acquiesced in the papal sentence, and continued in condemning the propositions agreeably to the design and meaning of the bull. Bains, notwithstanding the popular odium which he incurred, retained his office, and received further preference. He, and Hellek, his associate in the professorship at Louvain, were the two divines commissioned to attend the council of Trent, in the year 1563. In 1575, he was preferred to the deanery of St. Peter at Louvain, and elected chancellor of the university; and, in 1578, was appointed confessor of its privileges. In 1580 he died, at the age of seventy-seven years. Mosheim represents him as equally remarkable on account of the warmth of his piety as the extent of his learning. In proof of his charitable disposition it is alleged, that by his will he left his whole estate to the poor. His manners were engaging; and Tolet, one of his adversaries of the fraternity of Jesuits, said of him, "Michaele Bino nihil docuit, nihil humanum:" nothing can be more learned, nothing more humble than Bains. As his works, relating chiefly to the controversy concerning grace and free-will, are not likely to be now much sought after, it is not unsafe to enumerate them. They were printed entire in 4to, at Cologne, in 1692. They are written with logical precision, and in a neat style. Gen. Dict. Mod. Eccl. Hist. vol. iv. p. 235, and 236.

BAIX, in Geography, a town of France, in the department of the Ardeche, two leagues and a half south-east of Privas.

BAIZE, a town of Germany; in the county of Tyrol, eight miles south of Trent.

BAIZE, in Commerce. See Bays.

BAKAL, in Geography, a town of Russia, in the government of Ufa, ninety-six miles N.W. of Ufa.

BAKAN, a town of Asia, in the Birmian empire, seated on the river Ava. N. lat. 19° 35', E. long. 98° 3'.

BAKER, Sir Richard, in Biography, an English historian, was the grandson of Sir John Baker, chancellor of the exchequer, in the reign of Henry VIII., and born at Sillingerhill in Kent, about the year 1508. He was entered as a commoner at Hart's Hall, in Oxford, in 1524, and having spent three years in academic studies, finished his education in one of the inns of court, and by travelling. In 1603, he obtained the honour of knighthood; and in 1620 he was appointed high-herifl of the county of Oxford. By involving himself in pecuniary embarrassment, in consequence of his marriage, he was obliged to take refuge in the Fleet prison, where, after remaining there several years, he terminated his life in 1645. In these circumstances of confinement and humiliating distress, he obtained relief by study, and from the influence of religious principles. Besides other tracts of less importance, in the composition of which he amined himself, his principal work was the "Chronicle of the Kings of England from the Time of the Romans' Government unto the Death of King James," published in folio, at London, in 1641, and afterwards continued by Edward Phillips, a nephew of Milton. This chronicle continued to be popular for several years, and deferredly so if the author's account of it be just; for he says, "that it was collected with so great care and diligence, that if all other of our chronicles should be lost, this only would be sufficient to inform posterity of all passages memorable or worthy to be known." But of this performance a least favor able opinion has been entertained by others; and the critical examination of Thomas Blount in his "Anecdotes upon Sir Richard Baker's Chronicle, and its Continuation," published in 1600, at Oxford, in 1672, in which many gross errors, respecting dates, names, places, and facts, were pointed out, greatly depreciated its value in the public estimation. Although a new corrected edition, with a second continuation, appeared in 1752, yet Baker's chronicle remained, after all, a performance ill-constructed, injudicious, and unworthy of confidence. Of the writer's taste and style the following commendation of his panegyrist, Sir Henry Wotton, will afford an adequate idea: "I much admire the character of your style, which seemeth unto me to have not a little of the African idea of St. Afinin's age; full of sweet raptures, and of researching conceits; nothing borrowed, nothing vulgar, and yet all flowing from you, I know not how, with a certain equal facility." Biog. Brit.

BAKER, Thomas, an eminent mathematician, was born at Ilton in Somercotes, about the year 1625, and was educated at Oxford. In 1645 he was elected scholar of Wadham college, took his degree of bachelor of arts in 1647, and soon afterwards left the university. As vicar of Bishops Nymnet in Devonshire, he lived in studious retirement, and chiefly applied himself to the study of mathematics; during which time he took the following note on the Geometrical Key, or the Gate of Equations unlocked, and published at London in 1684, 4to, in Latin and English. An account of this book is given in the Phil. Trans. vol. xiv. No. 157. p. 549, 550. (See Central Rule.) To some mathematical queries, sent to him by the members of the Royal Society, not long before his death, he returned an answer so satisfactory, that they gave him a medal, with an inscription honourable and respectable. He died at Bishops Nymnet, June 5th, 1699, and was buried in his own church. Biog. Brit.

BAKER, Thomas, a writer and antiquary of eminence, was born at Lanchester in the county of Durham, in 1656, and studied at St. John's college, Cambridge, where he became a fellow. In 1699 he published, in 8vo, an anonymous work, intitled, "Reflections upon Learning, wherein is shewn the Insufficiency thereof, in its several Particulars, in order to evince the Necessity and Usefulness of Revelation," which passed through several editions, and was regarded, for many years, as a standard of wise writing. As to its style, however, it has been observed, that, whilst it is allowed to be perspicuous and manly, it has no claim to any high degree of elegance; and whatever merit the work in general may be supposed to possess, it will be justly questioned, whether an author, who bewails cold and partial praise on Bacon, who in a chapter of metaphysics omits the mention of Locke, who speaks contemptuously of the Copernican system, and who attacked Le Clerc with an unbecoming airy, was duly qualified to pass judgment upon general learning. The ingenious Dr. Jortin says of him (Life of Erasmus, p. 550, 551), "that he was no critic himself, and not at all acquainted with the true state of chilfich books, and particularly of Greek authors." Baker, though he possessed real erudition, and though his remarks are often acute and ingenious, has unduly disparaged the writings of able men, and the discoveries of modern science. In the progress of his life, he pursued studies for which he seems to have been better qualified. As a collector of antiquities, and particularly of such as related to the church and university, he excelled. His talents in this way were employed in collecting materials for a history of the university of Cambridge; but though he lived to an advanced age, the history was never completed.

Baker
BAK

Baker was unquestionably a man of integrity and candour. By life he was referred to as the ablest required by government at the election of George I. He left his fellowships; but he retained his chambers at St. John's college, which was highly esteemed, and Mr. Prior, the celebrated poet, at the profits of his own fellowship to Baker, in order to supply the loss of income which he had sustained. He corresponded with men of learning, and the letters of learning, and he was liberal in his literary contributions to those which he considered the purveyors of information and protection to his friends. who was indebted to him for several remarks and corrections relating to his "History of the Reformers." These two parts, though very different from each other with regard to their subjects and principles, met tender and friendly intercourse, which were honourable to both. Baker's private character was amiable, and he was beloved and respected by all who knew him. He died at Cambridge, July 21, 1746, in his eighty-fourth year. Of his extensive collections, he left twenty-three volumes in folio, written by his own hand, to Lord Oxford, and they now compose part of the Harlani collection in the British museum. He also bequeathed fifteen volumes folio, of a like kind, to the public library at Cambridge, together with other MSS. and printed books. Biog. Brit.

"Mr. Baker," says a late biographer, Horatio Walpole Earl of Oxford, "lived and died in charity with all mankind, and was perhaps the noblest man of his age, who bequeathed his valuable books to a society that eXected him, and to the ministers of a church in which he had left preferment." Memoirs of the Life and Writings of the late Thomas Baker, &c. by R. Maber. 1784.

BAKER, Isaac, an ingenious and diligent naturalist, was born in London near the close of the seventeenth or the beginning of the eighteenth century, and apprenticed to a bookseller. This employment, if he ever engaged in it after the expiration of his apprenticeship, he soon relinquished; and having directed particular attention to the methods which might be practicable and useful in the care of common rings, he engaged in teaching deaf and dumb persons to speak; and in this undertaking he was very successful. He married a daughter of the celebrated Daniel Defoe. In the earlier period of his life, he indulged a taste for poetry, and published, in 1725 and 1726, "Original Poems, serious and humorous," in two parts, in which there are some tales that resemble in wit, and also in licentiousness, those of Prior. He was the author likewise of "The Universe, a Poem intended to reclaim the Pride of Man;" several times reprinted, and of "An Invocation to Health," reprinted in his "Original Poems." At a more advanced period of life, he purposed various branches of study and experiment in philosophy and natural history, and devoted himself more exclusively to microscopical researches and observations. In 1742, he was elected a fellow of the Antiquarian and Royal Societies; in both which he was a regular attendant. In 1744, the Royal Society honoured him with Sir Godfrey Copley's medal in recompense of his microscopical discoveries, the crystallizations and configurations of saline particles. Among various topics, on which he communicated papers to the Royal Society, that have been published in their Transactions, one was the water-polyne (see Polype); and his remarks on this curious animal were enlarged into a separate treatise, which passed through several editions. The most important and valuable of his observations are contained in his two principal works, intitled, "The Microscope made safe," and "Employment for the Microscope," of which many editions have been published. Mr. Baker was one of the earliest and most zealous members of the society for the encouragement of arts, manufactures, and commerce; and by his extensive correspondence he was eminently useful in introducing into his own country several valuable methods of culture. To him we are indebted for the true history of the "Coccus Polonianus," for the "Alpina Strabiana," and for the "Rhamn Phalangus." After the first discoveries in electricity, he was one of the first who announced to the public the apprehended medicinal effects that might result from the application of it, and to relate the experiments of this kind which had been made at Rome and Bologna. He did not, however, cheapen the virtues of critics, and particularly of Mr. Hill, in his review of the works of the Royal Society. It has been said of him, more to the chagrin of those who have thrown out this invidious and injudicious reflection on him to his disgrace, that he was a philosopher in both things; but careless of his description in order to forget that the minute productions of nature display the great and small, as much as the large, and they generally change the vulgar eye. Mr. Baker, like one of his biographers, was "an intelligent, upright, benevolent man, much respected by those who knew him best. His friends were the friends of science and virtue; and it will be always remembered by his contemporaries, that no one was more ready than himself to afford those with whom he was conversant, in their various researches and endeavours for the advancement of knowledge and the benefit of society. After a life industriously devoted to these great objects, he died at his apartment, in the Strand, Nov. 23th, 1774. The bulk of his fortune was bequeathed to his only grandson; and he left 122l. to the Royal Society for an anatomical or chemical lecture. Biog. Brit.

BAKER'S Central Rule, in Mathematics. See Central

Rule.

BAKER'S Dyer Islands, in Geography, a cluster of islands near the east side of Hudson's bay, about N. lat. 57° 30' and W. long. 81°, to the west of an opening which goes to the east and north-east as far as the south-east end of Hudson's straits.

BAKERSFIELD, a newly-settled township of America, in Franklin county, Vermont, formerly in Chittenden county.

BAKERSTOWN, lies in Cumberland county, and diocircuit of Maine, containing 1276 inhabitants; distant 102 miles north-east from Boston.

BAKEU, or BACOU, a town of European Turkey, in the province of Mollavania, 80 miles west of Jaffa.

BAKEWELL, is an ancient market town of England, in the county of Derby. In the Saxon chronicle it is called Badeceawellum; from which circumstance Mr. Bray conjectures that a bath had been used in this place previous to the year 924, at which time King Edward the elder ordered a strongly fortified town to be built in the vicinity. The parish of Bakewell is the most extensive in the county; its length from north to south being more than twenty miles, and its breadth upwards of eight. Its number of houses is 299, and that of inhabitants 1472. In consequence of the extent of this parish, it has nine chapels of ease besides the church in the town. The latter, situated on an eminence, is an ancient and handsome structure, built in the form of a crescent, with an octagonal tower in the centre, supporting a lofty spire. The architecture of this fabric combines a variety of styles. The plain Saxon appears in the nave, and the arch of the western doorway is enriched with zigzag ornaments; but the other parts are built in that style which prevailed in the fifteenth century. Here are fone ancient and curious monuments. In the church yard is a Catholic stone cross, whose sides are ornamented with a rudely executed
The market was formerly held on a Monday, but it is now kept on Fridays. Near the entrance of the town from Ashford is a large mill for the carding, roving, doubling, spinning, and twining of cotton; in which manufacture from 300 to 350 persons of both sexes are constantly employed. This mill was erected by the late Sir Richard Arkwright, who was the founder of the cotton trade in this neighbourhood. Between the gritstone and limestone strata about Bakewell, is a thick stratum of flint, which being of an argillaceous nature, and retentive of moisture, renders the pallurage extremely good and thriving. Bakewell is 25 miles north of Derby, and 152 miles north-west from London. About three miles east of this town is Chatsworth, a magnificent seat of the duke of Devonshire. This celebrated mansion was erected by William the first duke of Devonshire, in the year 1702. It is built in the Ionic order, with a flat roof, surrounded by a balustrade. Its form is nearly a square, of about 106 feet, including a spacious quadrangular court, having a fountain in the centre, with the statue of Orpheus. The fronts which form the quadrangle, are decorated with rich sculptural representations of military trophies. This mansion is sumptuously furnished, and embellished with carved ornaments by the celebrated Gibbons, with painted walls and ceilings, with portraits, also a collection of fossils, &c. The unfortunate Mary, queen of Scots, was doomed to thirteen years' captivity in the old mansion at this place. The park is about nine miles in circumference, and is diversified with much grand, picturesque, and beautiful scenery. The water-works, which about fifty or sixty years ago gave Chatsworth great celebrity, are still preferred near the south-east and south sides of the house; but they attract little attention in the midst of such a variety of natural beauties.

About two miles south of Bakewell is Haddon Hall, a truly venerable mansion belonging to his grace the duke of Rutland. The high turrets and embellishments of this house, when beheld at some distance, give it the resemblance of an ancient fortified castle. It consists of numerous apartments and offices, which surround two paved quadrangular courts. The most ancient part is the tower of the gateway, which was probably built about the time of Edward the Third. The gallery was erected in the time of queen Elizabeth; but the chapel was raised in the reign of Henry the Sixth. Many of the rooms are very spacious; and the doors were concealed behind the hangings of arras, which must have been always lifted up for persons to pass in and out. Haddon Hall presents perhaps a more complete specimen of the ancient English baronial mansion, than is to be found in any other house in the kingdom. For a particular description of it see The Beauties of England and Wales, vol. iii. p. 494.

At a short distance from Bakewell is Ashford, where are some considerable marble works. Thence were the first of the kind established in England, and great quantities of black and grey marble are faved and polished. This operation is performed by machinery, which is kept in motion by water. One part, called the levering mill from its circular motion, will work upon, and level a foot of marble flabs of eighty superficial feet. Beauties of England and Wales, vol. iii.

**BAKEWELL BREED,** an improved species of sheep, which have been bred by Mr. Bakewell of Dilliegh. See SHEEP.

**BAKHYUSEN.** See BACHUYSEN.

**BAKIAN.** See BACHIAN.

**BAKING,** the art of preparing bread, or of reducing meats of any kind, whether simple or compound, into bread.

Vol. III.

The forms of baking among us may be reduced to two; the one for unleavened, the other for leavened bread.

The learned are in great doubt about the time when baking first became a particular profession, and bakers were introduced. It is generally agreed they had their rise in the East, and passed from Greece to Italy after the war with Pyrrhus, about the year of Rome 535. This which every housewife was her own baker, for the word *fōlor*, which we find in Roman authors before that time, signified a person who ground or pounded the grain in a mill or mortar to prepare it for baking, as Varro observes. According to Athenaeus, the Cappadocians were the most applauded bakers, after them the Lydians, then the Phrygians.

To the foreign bakers brought into Rome, were added a number of freedmen, who were incorporated into a body, or, as they called it, a *collega*; from which neither they nor their children were allowed to withdraw.—They held their effects in common, and could not dispose of any part of them. Each bake-hous had a *patronus*, who had the superintendency thereof; and three *patroni* elected one out of their number each year, who had the superintendence over the reft, and the care of the college. Out of the body of the bakers, every now and then, was one admitted among the senators.

To procure honour and honesty in the college of bakers, they were expressly prohibited all alliance with comedians and gladiators; each had his shop or bakehouse, and they were distributed into fourteen regions of the city. They were excused from guardianships and other offices, which might divert them from their employment.

By our own statutes, bakers are declared not to be handicrafts. No man for using the mysteries or sciences of baking, brewing, furnishing, or writing, shall be interpreted a handicraft. 22 H. VIII. cap. 13.

The bakers of London make the nineteenth company. They were incorporated about the year 1507, and constitue of a master, four wardens, thirty affillents, and one hundred and forty-nine on the livery, besides the commonalty. See COMPANY.

The bakers of London are under the jurisdiction of the lord mayor and aldermen. A penalty is inflicted on bakers selling at a higher price than is set by the lord mayor; and bakers are to let their marks on their bread. The issue of bread is regulated by several statutes. See BREAD.

The manner of baking at Otaheite, and in many islands of the South seas, is as follows. They make fire by rubbing the end of one piece of dry wood upon the side of another, just as the carpenters whet a chisel; they then dig a pit in the ground, about half a foot deep, and two or three yards in circumference; they pave the bottom of it with large pebble stones, which they lay very smooth and even, and then kindle a fire in it with dry leaves and the husks of the cocoa-nut. When the stones are properly heated, they take out the embers and rake out the ashes on every side, then cover the stones with a layer of green cocoa-nut tree leaves, and wrap up the animal that is to be dressed, in the leaves of the plantain. If it be a small hog, or dog, they wrap them up whole; if large, they split them. When placed in the pit, they cover it with hot embers, and lay upon them bread-fruit and yams wrapped up in like manner in the leaves of the plantain. Over these they spread the remainder of the embers, mixing among them some of the hot stones, with more cocoa-nut tree leaves and then close up all with earth, so that the heat is kept in. After a time proportioned to what is dressing, the oven is opened, and the meat taken out, tender, full of gravy, and, as captain Wallis thought, better in every respect than when it is dressed any other way. Having no vehicles
vessels in these islands that could bear the fire, the inhabitants of them had no idea of hot water, or its effects, and therefore always roasted or baked their meat in the manner above related. Hawkefoworth's Account of Voyages in the Southern Hemisphere, vol. I. p. 484.

Bakew is used for the exposing a substance, inclosed in a crust, to the fire. See Dressing of Meats.

Baking Porcelain. See Porcelain.

BAKON, in Geography, a large forest of Hungary, near Veprin, where Andrew, king of Hungary, in a battle with his brother, was forsaken by his followers, and trampled to death by his enemies.

BAKSAIKAL, a fortress of Russian Tartary, in the government of Caucausus, on the W. side of the Ural; 32 miles north of Gurica.

BAKTEGAN, the name of a salt lake of Persia, about fifty miles east of Shiraz, which receives the rivers of Kuren and Bundamir. It is represented in the maps as being about 40 British miles long, and 16 broad.

BAKU, a town of Persia, in the province of Shirvan, on the west coast of the Caspian sea, with a harbour. N. lat. 45° 25'. E. long. 55° 2'.

The port of Baku is reckoned the safest harbour of the Caspian, because ships may lie there at anchor in seven fathom water; yet in some places the entrance is dangerous on account of shallows, islands, and sand-banks. Baku, like Derbent, is inhabited by Persians, Tartars, and some few Armenian merchants. The principal articles of export by which the traffic of this place is chiefly supported, are the raphtha, and the fine rock-salt, both of which are collected on the east side of the bay. The inhabitants indeed cultivate saflron and cotton, but not with any considerable advantage. The trade of Baku is doubled of more consequence than that of Derbent, though in fact but very confined, and is mostly carried on with Shamachy, whence it gets silk and silk-roufs. A Russian consul usually resides here.

BALA, in Botany, a name used by some authors for the maidis, or plantain tree; called alo the banana and foetida, by others.

Bala, in Ancient Geography, a city of Pentapolis, so called because it was surrounded up, as the word imports; this is not quitting it. It is more usually denominated Zabor.

Bala, in Geography, a town in the county of Merianeth, in North Wales, confiding of one street, with a high artificial mount, apparently the keep of a fortress, on the southeast end of it. It is situated on the cañon extremity of the fine lake to which it gives a name, and whose fish contribute largely towards the subsistence of its inhabitants. The fairs and markets are considerable, and abundantly supplied with the produce of the surrounding country, and with flannels, gloves, flocks, &c. In the manufacture of the latter articles, the inhabitants of the town and of the neighbouring villages are constantly employed. "Knitting," observes Mr. Akin, "is the general leisured work of both sexes in Wales, especially about Bala; and it cannot fail of giving strangers a high idea of the industry of the people, to see the men and women going to market with burdens on their heads, while their hands are employed in working the fibres of their own sheep into articles of dress, coarse indeed, but equally warm and serviceable with the more costly and elaborate manufactures." Bala is in the parish of Llanyci, a village about one mile from the town. The whole parish includes a population of 2445. Though endowed with many valuable privileges, Bala cannot boast of any particular or elegant structures. It is an incorporated town by prescription, and the government is vested in two bailiffs and a common council; but neither this nor any other town in the county has ever sent members to parliament. The alms are kept here and at Dulpsey alternately. Its market is on Saturdays, and here are two fairs annually. It is 36 miles from Holywell, and 203 from London. "The object best worth notice in this neighbourhood is—

"Bala Pool, or Pimble-more, or Lyn-tregy, which is the largest lake in Wales. Its length from N. E. to S. W. is about four miles, and its breadth in the widest part is 1200 yards. The water, like that of most rocky lakes, is so pure that the most delicate chemical tests detected scarcely any perceivable quantity of foreign admixture. The south-western extremity, where three mountain torrents fall into the pool, is the shallowest, owing to the great quantity of earth and stones which are borne down in flood time from the country through which they flow; the gradual aggregations have formed several banks and low islands in this end of the lake, and in consequence obliged it to encroach proportionally on the north-eastern boundary. This tendency is further increased by the prevalence of strong westerly winds, which drive on the shore a heavier forf than would be imagined. When these two causes combine, a circumstance that not unfrequently happens, the waters rise to such an alarming height, as to threaten the town of Bala with an inundation, were it not for a dyke that is raised on the shore: the water being thus obstructed pours over the road at the extremity of the mound, and discharges itself into the low grounds through which the Dee flows, doing no small damage to the rich and extensive pastures. The lake is well stocked with excellent fish, of which the red trout and the gwyniad are esteemed the most delicious. These are all caught by angling from the shore, for Sir W. Wynne, who claims the property of the whole pool, will not allow any boats to be kept on it." The scenery round this lake is much admired for its diversified, wooded, and rocky characteristics. Akin's Journal of a Tour through North Wales, &c.

From the bottom of this lake issues the river Dee, which is said to pass through it without mingling its waters with that of the lake (see Abyssinia); and passing under a romantic old bridge, winds gently in a wide and deep stream towards Corwen and Llangollen. Bala is surrounded with mountains, through which various roads are formed towards Dinamshowy, towards Llangwilling over the Berwin, and towards Llanrwst in the vicinity of Snowdon.

BALAAM, in Scripture Biography, the son of Beor or Bofor, a prophet or diviner, of the city of Pethor on the Euphrates. He was sent for by Balak, king of the Moabites, to curse the Israelites; but he pronounced upon them a blessing. He was killed, together with Balak, in a battle, in which the Israelites defeated the Midianites, about 1450 years before Christ. Numb. xxii., xxiii., xxiv. Deut. xxi. 4. 2 Pet. ii. 15. Jude, ver. 11. Rom. ii. 14. It has been a subject of controversy, whether Balaam was a true prophet or a mere diviner, magician, or fortune-teller, bariloche, as he is called. Numb. xxii. 5. Origen says, that his whole power consisted in magic and cursing. Theodoret is of opinion that Balaam did not consult the Lord, but that he was supernaturally inspired, and constrained to speak against his own inclination. Cyril says, that he was a magician, an idoleater, and a false prophet, who spoke truth against his will; and St. Ambrose compares him to Caiphas, who prophesied without being aware of the import of what he said. Jerome seems to have adopted the opinion of the Hebrews; which was, that Balaam knew the true God, created altars to him, and that he was a true prophet, though corrupt-
B L A

rupted by avarice. Numb. xxii. 18. St. Aulfin and other commentators have inclined to this opinion.

Maimonides thinks, that every thing which happened to Balaam in the way to Balak, was done in a prophetic vision. The abbot Jerusalem, and his followers, suppose Balaam to have been an erring impostor, who had acquired the reputation of being a prophet, and made a public traffic of his divinatory art. With this view he身形 frequent consultations with God, and delivers his own ideas for divine oracles. He supposes that Moses infected the history of Balaam, as an episode, from Nabonide's memoirs, for the purpose of obviating prophetic difficulties, on the supposition that Moses was the original writer. Dr. Geddes, in conformity to the few extant words which he had adopted with regard to the pentateuch, declares it to be his opinion that this history was written, not by Moses, but by the compiler of the pentateuch, from such traditional stories or scraps of written documents as he could find. "Indeed," he adds, "it has all the air of a legendary tale."

The story of Balaam's afs has often been an object of ridicule among sceptics and infidels. The abbot Jerusalem thinks that it was all a fiction of Balaam, to save himself from obloquy, if he should bleed, instead of cursing, the Israelites. Dr. Jortin (Six Dillertations, Diff. v.) supposes, that Balaam was a worshipper of the true God, and a priest and prophet of great reputation; and that he was sent for by Balak, from a notion which generally prevailed, that priests and prophets could sometimes, by prayers and sacrificces duly and skillfully applied, obtain favours from God, and that their imprecations were efficacious. He conceives that the prophet had been accustomed to revelations, and that he used to receive them in visions, or in dreams of the night. With regard to the intercourse between Balaam and his afs, he conjectures that it was transferred in a trance or vision. Accordingly, he admits that an angel of the Lord did, indeed, come to oppose Balaam in the way, and suffered himself to be seen by the beast, but not by the prophet; that the beast was terrified, and Balaam smote it, and immediately fell into a trance or ecstasy; and in that state of vifion, conversed with the beast first, and then with the angel. The angel presented the objects to his imagination, as strongly as if they had been before his eyes; so that this was a miraculous or supernatural operation. Dr. Geddes says, that to him there appears nothing strange in the story of the afs, but the manner of telling it; and it ceases to be wonderful, when we recollect the oriental mode of narrating. Balaam is riding on his afs on yet a doubtful errand; the afs startles at something, and turns aside from the way; throws his master's legs against a wall, and at length falls down under him. All this he takes for a bad omen, and a sign that his journey is not agreeable to God. God is thence conceived to be angry with him, and an imaginary dialogue ensues between God and Balaam, as had been before supposed to be held between Balaam and his afs. Geddes's Crit. Remarks, vol. i. p. 394.

BALAMITES, in Ecclesiastical History, the name of a sect in the first age of Christianity, of the fame import in the Hebrew language with Nicolaitsans. See Nicolaitsans.

BALABAC, in Geography, one of the Philippine, or rather Bornean islands, between Borneo and Palawa, near the south-western point of the latter island. N. lat. 7° 50'. E. long. 117° 30'.

B A L A B A D E A, an island near the north-west end of New Caledonia. S. lat. 27° 17'. E. long. 164° 22'.

B A L A B O L A. See BOLBOLO.

B A L A C H N A. See B ALANKA.

B A L A D, a town of ABA, in the country of Diarbekir, twenty miles north-west of Mosul.

BALADE, the name of a harbour on the north-west coast of New Caledonia island, in the South Pacific ocean, formed by a reef which runs parallel to the coast, at the distance of three leagues, and near the western extremity of the island. S. lat. 20° 15'. E. long. 164° 40'.

B A L A E N A, Whale, in Zoology. Whales are a tribe of cetaceous creatures, which in external appearance, and certain habits of life, in their native element, the water, form to approach to nearly to the other kinds of the funny race, that the earlier writers, who were little acquainted with their history, and perhaps fill less with their internal structure, may be fully excused for confounding them to the tribe of fishes. To say nothing of their anatomy, the want of fct, which is an obvious defect in the whale, was among other cogent reasons for retaining it with the latter. Our countrymen, Ray and Willughby, both include the whales in their systems of ichthyology; Ray, whose natural arrangement of the animal tribes deferves no common praise, divides his fishes into two principal sections, one comprehending those which have lungs for respiration, and the other, those which breathe by means of the gills, and are truly fishes. The reasons he offers for including the former with the fishes are these; because the form of their bodies agrees with those of fishes; because they are entirely naked, or covered only with a smooth skin; and because they live entirely in the water, and have all the actions of fishes. Notwithstanding this, Linnaeus, whose accuracy of discrimination an enlightened politerity bid fair to honour and esteem, has referred them to the mammalia tribe of animals; a reference extremely just, but the propriety of which will not appear so obvious at the first glance to the curiously observer, as to the accurate anatomist, or indefatigable historian of nature.

The whale, notwithstanding its fish-like external appearance, and residence in the waters, has no other claim to a place among fishes; for its internal anatomy is precisely the same as that of the terrestrial animals, and of the quadruped tribe in particular. Such is the opinion advanced by that eril of naturalists, Linnaeus; and such is the opinion confirmed by the remarks of that able anatomist the late Mr. Hunter. In a paper presented on the anatomy of whales, to the Royal Society of London, a few years ago by the latter, it is observed, that this order of animals has nothing peculiar to fish, except living in the same element, and being endowed with the same powers of progressive motion, as those fish which are intended to move with a confiderable velocity. Although inhabitants of the waters, they belong to the same class as quadrupeds; breathing air, being furnished with lungs, and all other parts peculiar to the economy of that class, and having warm blood. The projecting part, or tail, contains the power that produces progressive motion, and moves the broad termination, the motion of which is similar to that of an oar in fowling a boat; it supercedes the necessity of posterior extremities, and allows of the proper shape for swimming. The tail is flattened horizontally, which is contrary to that of fish; this position of tail giving the direction to the animal in the progressive motion of the body. The two lateral fins, which are analogous to the anterior extremities in the quadruped, are commonly small, varying however in size, and seem to serve as a kind of oars. The element in which they live renders some parts, which are of importance in other animals, useless to them; gives to some parts a different action, and renders others of less account. The larynx, fize of the trachea, and number of ribs differ exceedingly. The coecum is only found in some of them. The teeth in some are wanting. The blow holes are two in number in many; in others only one. The bones alone, in many animals, when properly united...
into what is called the skeleton, give the general shape and character of the animal. Thus a quadruped is distinguished from a bird, and even one quadruped from another; it only requiring a skin to be thrown over the skeleton to make the species known. But this is not so decidedly the case in this order of animals, for the skeleton in them does not give the true shape. An immense head, a small neck, few ribs, and in many a short sternum, and no pelvis, with a long spine, terminating in a point, require more than a skin being laid over them in order to give the regular and characteristic form of the animal. The structure of the bones is similar to that of the bones of quadrupeds; they are composed of an animal substance, and an earth that is not animal; they are less compact than those of quadrupeds that are similar to them. From these and other observations we may infer, that the structure, formation, arrangement, and union of the bones, which compose the forms of parts in this order of animals, are much upon the same principle as in quadrupeds. The skin and muscles of this order of animals are red, resembling those of quadrupeds, and perhaps more like those of the bull or horse than any other animal.

The Linnaean definition of the mammalia class, having a heart with two auricles and two ventricles, and the blood warm and red, applies most strictly to the whale. "The heart," Mr. Hunter says, "is inclosed in its pericardium, which is attached by a broad surface to the diaphragm, as in the human body. It is composed of four cavities, two auricles, and two ventricles; it is more flat than in the quadruped, and adapted to the shape of the chest. The auricles have more falciculi, and these pass more across the cavity from side to side, than in many other animals; besides being very muscular, they are very elastic, for being flattered they contract again very considerably. There is nothing uncommon or particular in the structure of the ventricles in the valves of the ventricles, or in that of the arteries." In their amours and mode of producing their young, the whales agree with other creatures of the mammalia tribe; and like them they have teats, and suckle them.

The balena genus is distinguished, according to Linneus, by having horny lamina in the superior jaw instead of teeth, and a double respiratory orifice on the upper part of the head. By these characters the tritca whales may be distinguished from the other genera of cetaceous animals, as the monodon, physeter, and delphinus. The history of the whales will be considered under the respective species, of which Linneaus and Gmelin describe the following: Mysticetus (common whale), Physalus (fin-fish), Balaena (piked-headed whale), Globisculus (round lipped whale), and Rostrata (beaked whale). The French naturalists distinguish two other species: Virg. speeches of the Baleine Franche, or Baleine de Groenland (B. myficus Linn.); le nord caver, or Baleine d’Irlande (baleena glacialis Bonn.); le gibar, or fin-fish (B. fin-fish Eng. and baleena phylalus Linn.); la baleine tasman (baleena nodica Bonn.); la Jambre (baleeni leons Linn.); le corral (balea musculus Linn.); and la baleine a bec (balea rostrata Linn.).

In concluding these remarks on the whale tribe, we cannot avoid advertting to the British Zoology of Mr. Pennant, in which these and other cetaceous animals found on our coasts are admitted under the title of cetaceous fishes; he follows the arrangement proposed by Ray, and seems to object chiefly to that of Linneus, because "to have preserved the chain of beings entire," he says, Linneus "should have made the genus of "sharks," or seals, and that of trichecus or manati, immediately precede the whale, those being the links that connect the mammals or quadrupeds with the fishes for the seal is, in respect to its legs, the most imperfect of the former class, and in the manati the hind feet coalesce, aflumming the form of a broad horizontal tail." Brit. Zool. vol. iii.

M. Bloch excludes the whales, and other cetaceous creatures, except the manofis or porpoise, from his work on fishes; but these are included in one of the smaller editions of the work, in the "seventh class, les cetacees." In a prefatory note we are informed, however, that Linneaus places these at the conclusion of the mammals, immediately after the hog-tribe; but as it might be agreeable to give the entire class in which the largest animals which nature produces are arranged, the omission of Bloch is supplied from Duhamel, with the assistance of Anfieron, Bonnerre, Artedi, Ray, and Delon.

BALANAE, in Natural History, a species of Echinodermata, that infests the intellines of the whale. Phips. "Ibid."

BALANARIS, in Cucanology, a species of Lepis, having a fuchiculous tail, with six elevated rugged four-parted lobes, and a membraneous bidentated operculum. Mili. Found adhering to the pericard fins and wrinkles of balana boops, or pike-headed whale.

BALANARUM, in Entomology, a species of Phalan- gium (Pyenogenum Fabr.), with two feelers and an ovate body. Gmel. This is phalangium littorale of Strocumfandum; pediculus ceti, Bailer; pyenogonum littorale Fabr. fn. Groenl.; and acarbus mannxus fen polygonopsis of Pallas. Inhabits European seas, lurking under stones. Back red; fucker advanced, straight, obtuse at the end, with a round perforation; feelers about as long as the fucker, and inferred near its base.

BALAGANSKOI, in Geographer, a town of Siberia, on the Angara, 50 miles W.N.W. of Irkuck. N. lat. 53° 45'- E. long. 103° 14'.

BALAGAT, or Balga-Gaut, a province of the Deccan, in the Indian peninsula. It is a tract naturally very strong, particularly on the west side towards the sea, where a flupenduous wall of mountains, called the Gants, rises abruptly from the low country, called the Conc, or Cockun, supporting, in the nature of a terrace, a vast extent of fertile and populous plains, which are so much elevated, as to render the air cool and pleasant. This elevated tract is continued not only through the Marhatta territories, but extends through the peninsula to the southern extreme of Mylore, and is named Balga-Gaut, throughout its whole extent; meaning literally the Higher or Upper Gants; or perhaps more correctly the countries lying above or below the Gants. In the peninsula, it is applied in contradistinction to Payen-Gaut, or the Lower Gants; but in the Deccan, it appears to be used only as a proper name, and not as a correlative; as we have never heard of the Deccan Payen-Gaut. Kennell's Mem. Introd. p. 127.

As a province, it was formerly the largest of the three which composed the northern Deccan, bounded on the north by Candis and Berar; on the east by Tellinga; on the west by Baghana and part of Guzerat; and on the south by Vifapore. This province, after it fell into the hands of the Moguls, assumed the name of Dowlatabad, from its former capital. It is a fruitful pleasant country, abounding with cotton and sugarc. Its chief city is Aurungabad.

BALAGUER, a town of Spain, in Catalonia, seated on the north bank of the river Segra, at the foot of a high hill. N. lat. 41° 38'. E. long. 0° 48'.

BALAKF, a district of the government of Saratof, in Russia, on the river Khoper.

BALAKNA, or Balachna, a town of Ruffia, in a district of the same name, being one of the thirteen districts of Nuhme Novgorod, on the right side of the Volga. The town was built in 1536, and contains 767 timber houses, and 1489 inhabitants. It trades to St. Petersburg, transports and sail, constructs biling-boats. It has one monastery.
monastery, five brick, and ten timber churches. N. lat. 56° 30'. E. long. 45° 5'.

BALEKAVLA, a fishing town of Crim Tartary, or Taurica, containing about 200 houses, and seated on a bay of the Black or Euxine sea, in N. lat. 44° 35'. E. long. 33° 41'. The bay forms a harbour; which, in the imperial proclamation declaring Theodosia and Eupatoria free ports, is described from navigation.

BALAKZEL, in Ornithology, the Turkisb name of the hernon.

BALALAIKA, in Music, a musical instrument of the lute kind, of very ancient Slavonian origin; it is in common use both with the Russians and Tartars; according to Neubuh, it is also frequent in Egypt and Arabia. The body of it is an oblong semicircle, about a span in length, with a neck or finger-board of four spans. It is played on with the fingers like the handour or guitar; but has only two wires, one of which gives a monotonous bass, and by the other the piece is produced. Under the touch of able fingers, accompanied by a good voice, it sounds agreeably enough; and therefore it is not unfrequently seen in the hands of people of fashion.

BALAMANGAN, in Geography, a small island in the Eastern Pacific ocean, near the northern point of Borneo, between this island and Palaw, remarkable for a settlement attempted by the English in 1773; but evacuated either on account of the unhealthy climate, or of a Dutch invasion. N. lat. 7° 10'. E. long. 117°.

BALAMBUAN, or PALAMBUAN, the name of a district or territory on the east part of the island of Java, which produces pepper, cotton, rice, Indian corn, and fruit in great plenty, and which abounds with pastures that feed a great number of horses, antelopes, buffaloes, and oxen. The capital, which is a strong trading town, is of the same name. S. lat. 7° 10'. E. long. 115° 30'.

BALAMUAN Channel. See Balli.

BALAMUS, Ferdinand, in Biography, born in the island of Sicily, about the middle of the sixteenth century, not less celebrated for his accomplishments in polite literature, and his skill in the Greek language, than for his knowledge of medicine, was greatly esteemed by pope Leo X. to whom he was physician. He published in 1556, at Lyons, "De eisbus bonis et mali fuci;" translated from the works of Galen; also "Galeni liber de obisbus, et Tyrus" 8vo. re-published at Frankfort, in fol. with observations by Gaifpar Hoffman, 1630. The above are infered in the edition of Galen's works, published by the Junta, 1786, fol. Since his death the following was printed at Rome: "De opima corporis nostrorum constitutione" "De bona valentudine," "De hyridinibus, cucurbitula, &c." 1636, 8vo. Haller Bib. Med. Præt. Eloy Diet. Haft.

BALAM PULLI, in Botany, a name used by some authors for the tree whose fruit is the tamarind of the shops.

BALANCE, or BALANCE, Libra, in Mechanics, one of the seven simple powers, or rather a species of that mechanical power called the lever, used principally for determining the equality or difference of weights in heavy bodies, and consequently their males or quantities of matter.

The balance is of two kinds, viz. the ancient and modern. The ancient or Roman, called also flatera Romana, or fcel- yard, consists of a lever or beam, moveable on a centre, and suspended near one of its extremes; on one side the centre are applied the bodies to be weighed, and their weight is estimated by the division marked on the beam, on the other side, where a weight moveable along it keeps the balance in equilibrio. See Steel-Yard.

The modern balance, now ordinarily in use, consists of a lever, or beam, suspended exactly by the middle; to the extremities whereof are hung scales or balances.

In each case, the beam is called the jugum, and the two moieties thereof on each side the axis, the brachia, or arms; and the handle whereby it is held, trivium; the line on which the beam turns, or which divides its brachia, is called the axis; and when considered with regard to the length of the brachia, it is esteemed but a point, and called the centre of the balance; and the places where the weights are applied, the points of suspension, or application.—That fnder part perpendicular to the jugum, by which either the equilibrium, or preponderancy of bodies is indicated, is called the tongue of the balance.

In the Roman balance, therefore, the weight used for a counterbalance is the same, but the points of application are various; in the common balance, the counterpoise is various, and the point of application the same.

The principle on which each is founded is the same, and may be conceived from what follows.

Balance, Doctrine of the.—The beam AB (Plate Mechanics, fig. 8.) the principal part of the balance, is a lever of the first kind, which, instead of resting on a fulcrum at C, its centre of motion, is suspended by somewhat fastened to the centre C: so that the mechanism of the balance depends on the same theorem as that of the lever.

Hence, as the known weight is to the unknown, so is the distance of the unknown weight from the centre of motion to the distance of the known weight, where the two weights will counterpoise each other; consequently, the known weights shew the quantity of the unknown.

Or thus: the action of a weight to move a balance is by so much greater, as the point prefixed by the weight is more distant from the centre of the balance; and that action follows the proportion of the distance of the fixed point from that centre. When the balance moves about its centre, the point B describes the arc BB (fig. 9.); whilst the point A describes the arc AA, which is the largest of the two; therefore in the motion of the balance, the action of the same weight is different, according to the point to which it is applied, hence it follows, that the proportion of the space gone through by the point A is as AA, and at B as BB, but those arcs are to one another as CA, CB.

Balance, Varieties in the Application of the.—If the brachia of a balance be divided into equal parts, one ounce applied to the ninth division from the centre, will equiconverte with three ounces at the third; and two ounces at the fifth division, as strongly as those at the fourth, &c.

Hence it follows, that the action of a power to move a balance is in a ratio compounded of the power itself, and its distance from the centre; for that distance is as the space gone through in the motion of the balance.

It may be here observed, that the weight equally preffes the point of fulpenion at whatever height it hangs from it, and in the fame manner as it was fixed at the very point: for the weight at all heights equally stretches the cord by which it hangs.

A balance is said to be in equilibrio, when the actions of the weights upon the brachia to move the balance are equal, so as mutually to deffroy each other. When a balance is in equilibrio, the weights on each side are said to equiponderate: unequal weights may also equiponde rate; but then the distances from the centre must be re-eropa as the weights. In which case, if each weight be multiplied by its distance, the product will be equal; which is the foundation of a fcel-yard, and the fee.

Thus in a balance whose brachia are very unequally, a scale hanging at the shortest, and the longest divided into equal parts; if such a weight be applied to it, as at the
the first division shall equiponderate with one ounce in the scale; and the body to be weighed be put in the scale, and the above mentioned weight be moved along the longest brachium, till the equilibrium be found; the number of divisions between the body and the centre shews the number of ounces that the body weighs, and the subdivisions the parts of an ounce. On the same principle also is founded the deceitful balance, which cheats by the inequality of the brachia: for instance, take two scales of unequal weights, in the proportion of 9 to 10, and one of them at the tenth division of the balance above described, and another at the ninth division, so that there may be an equilibrium; if then you take any weights, which are to one another as 9 to 10, and put the first in the first scale, and the second in the other scale, they will equiponderate.

But it is easy to discover the deceit of a false balance by changing the weights that are in equilibrio to the contrary scales; and thus the owner of the balance must either confess the fraud, or add to the commodity fold by means of such a balance, not only the quantity by which it was deficient, but also as much as he intended to gain by the fraud, and a fraction of that added weight proportional to the inequality of the arms of the balance. In this case, the buyer, instead of 9 lb offered to him for 10 lb his due, will have by changing the scales, $\frac{11}{\frac{11}{10}}$ pounds. For $9:10::10:11\frac{1}{10}$.

Several weights, hanging at several distances on one side, may equiponderate with a single weight on the other side: to do this it is required, that the product of that weight, by its distance from the centre, be equal to the sum of the products of all the other weights, each being multiplied by its distance from the centre.

To demonstrate which, hang three weights of an ounce each, at the second, third, and fifth divisions from the centre, and they will equiponderate with the weight of one single ounce applied to the tenth division of the other brachium; and the weight of one ounce at the sixth division, and another of three ounces at the fourth division will equiponderate with a weight of two ounces on the other side at the ninth division.

Several weights unequal in number on either side, may equiponderate: in this case if each of them be multiplied by its distance from the centre, the sums of the products on either side will be equal; and if those sums be equal, there will be an equilibrio.

To prove which, hang on a weight of two ounces at the fifth division, and two others, each of one ounce, at the second and seventh; and on the other side hang two weights, each also of one ounce, at the ninth and tenth divisions; and these two will equiponderate with those three. A balance of this kind, the arms of which are equally divided, has been sometimes called an arithmetical balance; because the arithmetical operations of addition, subtraction, multiplication, and the rule of three, may be easily performed by it.

E. g. To add the numbers 2, 3, and 7; apply an ounce weight at the second division, and another on the same arm at the third, and another at the seventh, then take an ounce weight, and move it along the other arm, till the beam is in equilibrio, which will be at the twelfth division; so that

$$2 + 3 + 7 = 12.$$  

To subtract 5 from 12; hang an ounce weight at one end of the arm at 12 inches, and another at the other end at 5; then move a third ounce weight along the arm till the equilibrium is restored, and it will be found at the seventh division, which gives $12 - 5 = 7$.

To multiply 4 by 3; suspend a four ounce weight at the third division on one arm, and move an ounce weight on the other, till the beam be in equilibrio, and it will mark out

$$12 = 4 \times 3.$$  

To divide 12 by 4; suspend an ounce at the twelfth division, and move a four ounce weight on the other arm, till there is an equilibrium, and it will be found at the quotient $12 = \frac{1}{4}$. G's Gravieand, Physica & Math. vol. i. p. 50.

To the justness of a balance it is required, that the points of suspension be exactly in the same line as the centre of the balance; that they be precisely equidistant from that centre on either side; that the brachia be as long as conveniently they may, in relation to their thickness, and the weight which they are intended to support; that there be as little friction as possible in the motion of the beam and scales; and lastly, that the centre of gravity of the beam be placed a little below the centre of motion.

We shall here add some further observations, which may serve to illustrate these properties of a good balance, and which deserve attention in the construction of this instrument for purposes that require peculiar accuracy. The balance is properly a lever, whose axis of motion is formed with an edge like that of a knife, and the two edges or scales at its extremities are hung upon edges of the same kind, which are first made sharp, and then rounded with a fine hone, or a piece of buff leather. On the regular form of this rounded part the excellence of the instrument very much depends. When the lever, or beam of the balance, is considered as a mere line, the two outer edges are called points of suspension, and the inner the fulcrum. The points of suspension are supposed to be at equal distances from the fulcrum, and to be previded with equal weights when loaded.

1. If the fulcrum be placed in the centre of gravity of the beam, and the three edges be all in the same right line, the beam of the balance will have no tendency to one position than another, but will rest in any position in which it may be placed, whether the scales be on or off, empty or loaded. 2. If the centre of gravity of the beam, when level, is immediately above the fulcrum, it will overset by the smallest motion; that is, the end which is lowest will descend; and it will do this with the greater velocity, in proportion as the center of gravity is higher, and the points of suspension are less loaded. 3. But if the center of gravity of the beam be immediately below the fulcrum, the beam will not rest in any position but when level; and, if disturbed from that position, and then left at liberty, it will vibrate, and at last come to rest in an horizontal position. Its vibrations will be quicker, and its horizontal tendency stronger, the lower the centre of gravity, and the less the weight upon the points of suspension. 4. If the fulcrum be below the line joining the points of suspension, and these be loaded, the beam will overset, unless prevented by the weight of the beam tending to produce an horizontal position, as in the third case. In this last case small weights will equilibrate, as in the last case; a certain exact weight will rest in any position of the beam, as in the first case; and all greater weights will cause the beam to overset, as in the second case. Many feakel are often made this way, and will overset with any considerable load. 5. If the fulcrum be above the line joining the points of suspension, the beam will come to the horizontal position, unless prevented by its own weight, as in the second case. If the centre of gravity be near the fulcrum, all the vibrations of the loaded beam will be made in times nearly equal, unless the weights be very small, when they will be flower. The vibrations of balances are quicker, and the horizontal tendency stronger, the higher the fulcrum. When the fulcrum, or centre of motion, C, (see fig. 10.) is in the right line joining the centres of suspension, it is evident that the equilibrium of equal weights, e. g. P and W, will obtain in every position; for the perpendicular
diculars let fall from C upon the directions will be always equal, but when C is above or below WP, an equilibrium of equal weights does not occur, and WP coincide with the horizontal line AB. In this case, the perpendiculars let fall from C upon the directions of W and P, projected to GB and GA, CG being perpendicular to AB; but when the balance is in any other position WP, the perpendicular CI is greater than CH, because \( \frac{CG}{CI} \) which is less than CI, is equal to \( \frac{CM}{CH} \), which is greater than CH. W will therefore descend and continue to vibrate till its motion be arrested by friction. (See Lever.) If P and W be unequal, and C be in the right line WP, the heavier of them will descend till WP be perpendicular to the horizon, or, if the center of motion be not in WP, till \( PX \tan \theta = WX \). It is evident from what has been said, that the nearer the centre of gravity of the beam is to the centre of motion, the nearer will be the balance, and the slower its vibrations; thus, if \( \triangle CBE \) (fig. 11.) is the beam, and C the center of motion, the difference between the effects of having the centre of gravity at K, or \( \theta \), will be the same as if we compared the velocities of two pendulums, of the length \( CK \) and \( CE \), which are in a subduplicate ratio of their lengths. The tendency to an horizontal position is, therefore, increased by lowering the center of gravity, in which case it will also require a greater additional weight to cause it to turn or incline to any given angle, and it is consequently less sensible with a greater load. The fixing of the centre of motion in a balance is, therefore, of peculiar importance, for on this depends the ease with which it will be affected by a smaller weight; and the readiness with which it will return to its horizontal position: and it is evident, that the belt position is that in which the centre of motion is a little above the centre of gravity; and even in this it should be proportioned to the distance of the weights from the fulcrum, and the quantity of matter to be weighed, which, in different beams, can only be attained by the practice and experience of the maker.

It has already appeared, that if the arms of a balance be unequal, the weights in equipoise will be unequal in the same proportion. But it should be observed, that though the equality of the arms of a balance is useful in the measurement of weights by bisection, a balance with unequal arms will weigh more accurately as another with equal arms, provided the standard weight itself be suitably counterpoised. Then taken out of the scale, and the thing to be weighed put into the scale, and adjusted against the counterpoise: or, when proportional quantities only are considered, the bodies under examination may be weighed against the weights, taking care always to put the weights in the same scale; for then, though the bodies may not be really equal to the weights, yet their proportions to one another will be the same as if they had been accurately equal to them. However, it is indispensably necessary that their relative lengths should continue invariable. For this purpose it is necessary either that the three edges be all truly parallel, or that the points of suspension and support should be always in the same part of the edge, which is requisite is most easily obtained.

If a beam is adjusted so as to have no tendency to any one position, as in case t. above stated, and the scales be equally loaded; then, if a small weight be added in one of the scales, that balance will turn, and the points of suspension will move with an accelerated motion, similar to that of falling bodies, but as much slower in proportion, very nearly, as the added weight is less than the whole weight borne by the fulcrum. The stronger the tendency to an horizontal position in any balance, or the quicker its vibrations (see cases 3. and 5.), the greater additional weight will be required to cause it to turn or incline to any given angle. If a balance were to turn with the ten thousandth part of the weight, it would move at the quickest 10,000 times slower than a falling body; that is, the diance containing the weight, instead of falling through sixteen feet in a second of time, would fall through only two hundred thousandth part of an inch, and it would require four seconds to move through one third part of an inch; consequently, all accurate weighing must be slow.

Long beams have been generally recommended; because the quantity of motion in a given body varies as its distance from the fulcrum; and, therefore, the greater the distance, the more distinguishable will be the motion arising from any small difference between, e.g. P and W. Long beams are also thought to have less friction; but this has been doubted. And it has been remarked, that the quicker angular motion, greater length, and less weight of a short balance, are certain advantages.

The index that is placed perpendicularly to the beam of a balance, in order to ascertain its position, affects its equilibrium, except it be in a horizontal situation; the momentum of the index being measured by the weight multiplied into the distance of its centre of gravity, from a line perpendicular to the horizon. But the error that would arise from hence is corrected by continuing the index, or placing a weight on the opposite side of the beam. The scales of a balance should be suspended in such a manner, that in all positions the string of the scales may be parallel to one another; otherwise the weights, though equal, will not be in equilibrio.

Very delicate balances are not only useful in nice experiments, but they are much more expeditious than others in common weighing. If a pair of scales, with a certain load, be barely sensible to \( \frac{g}{10} \) of a grain, it will require a considerable time to ascertain the weight to that degree of accuracy, because the turn must be observed several times, and it is very small. But if no greater accuracy were required, and scales were used which would turn with the hundredth of a grain, a tenth of a grain, or less, would make no great a difference in the turn, that it would be seen immediately. A degree of fineness may be given to a balance, that turns with a certain addition, but is not moved by any smaller weight, by producing a tremulous motion in its parts. Thus, if the edge of a blunt saw, a file, or other similar instrument, be drawn along any part of the scale or support of a balance, it will produce a jar, which will diminish the friction in the moving parts so much, that the turn will be evident with one third or one fourth of the addition that would else have been required. In this way a beam which would only turn by the addition of a tenth of a grain, will turn with the thirty or fortieth of a grain. In order to regulate the horizontal tendency in some beams, the fulcrum is placed below the points of suspension, and a sliding-weight is put upon the flye or index, by means of which the centre of gravity may be raised or lowered.

Mr. Nichollon, of whose observations on the properties of the balance we have availed ourselves in the preceding part of this article, has recommended the following set of weights, as proper to accompany it, when it is applied to chemical and similar purposes: viz. 1000 grains, 900 g. 800 g. 700 g. 600 g. 500 g. 400 g. 300 g. 200 g. 100 g. 90 g. 79 g. 69 g. 50 g. 40 g. 30 g. 20 g. 10 g. 9 g. 7 g. 6 g. 5 g. 4 g. 3 g. 2 g. 1 g. 1/2 g. 1/3 g. 1/4 g. 1/5 g. 1/6 g. 1/8 g. 1/16 g. 1/32 g. With these the philosopher will always have the same number of weights in his scales as there are figures in the number expressing the weights in grains. Mr. Nichollon subjoins an account of some balances, which have been constructed.
Armed by different persons for nice experiments. The first he mentions is that of Muifhetenbrook, which turned with \( \frac{1}{2} \) of a grain, and which weighed to \( \frac{\pi}{5} \) part of the weight, and a circle, made figures of about equal of the weight, and the other weighed \( \frac{1}{2} \) an ounce, and turned with the \( \frac{\pi}{5} \) of a grain, or the \( \frac{\pi}{5} \) part of the weight. Mr. Read's balance mentioned in p. 511 of the same volume, turned with less than a penny-weight, and even with four grains, when loaded with fifty-five pounds, i.e. about \( \frac{\pi}{5} \) part of the weight, and which might be relied on to five places of figures. Mr. Whitbread's balance (Ibid. p. 526) weighs one penny weight, and is sufficiently affected with \( \frac{\pi}{5} \) part of a grain, or \( \frac{\pi}{5} \) part of the whole. This balance, he says, will serve to determine all weights between 100 grains, and 4000 grains to four places of figures. Mr. Alcock's (mentioned Ibid. vol. ixxvii. p. 205) is true to three grains with 151\(^\circ\) an end; and hence the weight is known to \( \frac{\pi}{5} \) part, or to four, or barely five places of figures. The balance of Dr. George Fordyce, made by Mr. Ramfien, mentioned in the xxvii. volume of the Phil. Trans. when loaded with four or five ounces, and a difference of \( \frac{\pi}{5} \) part of a grain, or \( \frac{\pi}{5} \) part of the weight. Mr. Magellan's would bear \( \frac{\pi}{5} \) part of a grain, and when \( \frac{\pi}{5} \) part of a grain, with and one pound an end. This is the \( \frac{\pi}{5} \) part of the weight and answers to five figures. The Royal Society's balance, lately made by Mr. Ramfien, turns on feeler edges upon planes of polished crystal, and affords a weight to the seven millionth part, and may be used in general practice to determine weights to five places and better. To which we may add, that the balance used by count rumford, in his experiments for ascertaining the weight of beef to heat (Phil. Trans. for 1799. part ii.), served, as he informs us (p. 187), to measure \( \frac{\pi}{5} \) part of the weight, which he examined. Nicholson's Chemistry, c. vi. Parkinson's System of Mechanics, &c. p. 250, &c. Desaguliers' Exp. Phil. vol. i. p. 140, &c. Mr. Ludlam has contrived a balance of a new construction for the woolen manufacturers. Their thread is made into \( \frac{\pi}{5} \) parts of the same length; and the fineness of it is denominated from the number of \( \pi \) parts which go to a pound; the cotton being about \( \frac{\pi}{5} \) of a pound, and the flax near \( \frac{\pi}{5} \). This machine is designed for weighing the \( \frac{\pi}{5} \) parts of the weight, it being to determine their respective fineness. It resembles the beam of a common pair of scales; at one end of it is fixed a weight, called a counterpoise, and at the other end a hook; in forting, the \( \frac{\pi}{5} \) of the beam to be examined is put upon the hook, and finally down more or less, according to its weight, till the counterpoise, by resting, balances it: then the index or cock of the beam, points out on a graduated arch the number of \( \pi \) parts of that weight which go to the pound. A scale, instead of the hook, might be used for weighing money, if the arch were properly divided for that purpose. See a drawing of this machine and the explanation of the theory of it, in Phil. Trans. vol. x. N. 25, p. 205. The bent-lever balance, is a balance (fig. 12.) which acts by a fixed weight \( C \), increasing in power as it ascends along the arc \( FG \) of a circle, and pointing by an index to the number or division of the arc which denotes the weight of any body put into the scale \( E \). With this instrument, one constant weight serves to weigh all others, by only varying the position of the arms of the balance, instead of varying the places or points of suspension in the arms themselves. The following property of the balance was first sug-
upper arm, another arm 1½ inch long, projects from the pillar at right angles, with a hole through it two lines long, and a quarter of a line broad, and placed perpendicularly below the pulley of the upper arm, to receive a small plate 1½ inch long, and of such breadth and thickness that it may freely move up and down, and yet not play too freely in the hole. At each extremity of the plate is a small hook. The whole of this apparatus is included in a small case (fig. 13.), furnished with glazes, α, α, α, at the top and about it. The manner of using the ally balance is to place a fillet on the three pulleys of the support and arm; then the support is placed in the middle of the small case, and the other end of the fillet is passed below through a hole in the middle of the lower part of the frame, containing the window in the front part of the case, and fastened to a small weight of a cubic form. The fork of the balance is suspended on the inferior hook of the plate. By moving backwards and forwards the weight fastened to the string, placed upon the top of the drawer projecting beyond the fore-part of the case, the balance within is either raised or lowered. The bodies to be weighed, and the weights themselves, being put into the drawers, the drawer is put into the case, through the side-windows, which must be opened for that purpose. When any thing is added or taken away, by means either of the pinches, or of the small shovel, or spoon, the balance is let down so that the scales may rest upon the bottom of the case; and before it is lifted up again the windows must be shut, especially if the air is not perfectly still. The flat pieces of glass, often placed under the scales of an ally balance, serve, by their electrical power, capable of attracting, and of thus causing the lighter scales to preponderate where the whole matter weighs is to very small. See Phil. Trans. No. 419. p. 235.

The electricity of a flat surface about three inches square has been known to hold down one scale, when there was a weight of about 200 grains in the other.

**Balance, in Astronomy.** See Libra.

**Balance, in Horology,** is that part of a clock or watch, which, by its motion regulates and determines the beats.—The circular part of it is called the **rison,** and its spindle the **verge:** there belong to it also two **pallets** or nuts, which play in the flats of the crown-wheel; in pocket-watches, that strong fluid, in which the lower pivot of the verge plays, and in the middle of which one pivot of the crown-wheel runs, is called the **poeune:** the wrought piece which covers the balance, and in which the upper pivot of the balance plays, is the **cock:** the small spring in the new pocket-watches is called the **regulator.**

It appears from the testimony of historical accounts, as well as other evidences, that the balance was universally adopted in the construction of the first clocks and watches; nor was it till the year 1657, that Mr. Huygens united pendulums with clock works. (See Paxman.) In watch of early construction, the balance vibrated merely by the impulses of the wheels, without any other control or regulation: the motion communicated to the balance by one impulse continued till it was destroyed, partly by friction, and partly by a succeeding impulse in the opposite direction; and therefore the vibrations null, of course, have been very unsteady and irregular. These imperfections were in a great measure remedied by Dr. Hooke's ingenious invention of applying a spiral spring to the balance, the action of which on the balance of a watch is similar to that of gravity on a pendulum; each kind of force having the effect of correcting the irregularities of impulse and resistance which otherwise disturb the uniformity of the vibrations. In clocks and watches, the real measure of time is the balance, and all the other works merely to continue the motion of the balance, and to indicate the time as measured by its vibrations. The regularity of a time-keeper will therefore depend on that of the time in which the balance vibrates; and the investigation of this time of vibration, from the several data or conditions on which it depends, is an important object in this part of mechanical science. See Escapement, Clock, Time-keepers, and Watches.

That the balances of watches, when manufactured of steel, as they generally are, might be in a small degree magnetic, and that this property might have some influence in disturbing their vibrations, some have suspected, and others have denied, but Mr. Varley has lately, (See Philos. Magaz. vol. 1. p. 185.), pointed out a source of error which has been hitherto little, if at all, apprehended: and this is the polarity of the balance, or tendency of a particular point to the north; and of an opposite point to the south, so strong as to be sufficient materially to alter the rate of going of the machine, when set in different positions. If this cause of error had been known, the use of these balances would have been substantially long ago, particularly where accurate performance is indispensable, as in time-pieces for astronomical and nautical purposes. Mr. Varley having ascertained the fact, and knowing the position of the poles, proceeded to examine the effects produced by this cause upon the watch's rate of going. Having put on the pendulum spring, and replaced the balance in the watch, he laid the watch with the dial upwards, that is, with the plane of the balance horizontally, and in such a position that the balance when at its place of rest should have its marked side towards the north, in this situation it gained 5° 37' in 24 hours. He then changed its position, so that the marked side of the balance when at rest should be towards the south, and in 24 hours it lost 6° 38' producing, by its change of position only, a difference of 12° 23' in its rate. This difference must be still further augmented or diminished as the weather might happen to carry in his watch coat pocket, a key, a knife, or any other article made of steel. Substituting in the room of the steel-balance, one made of gold, he found that the watch's rate of going was as uniform as that of any watch on the like construction.

**Balance, Hydrostatical, in Hydrostatics,** is an instrument for determining the specific gravities of bodies. See Hydrostatical, and Specific Gravity.

**Balance of Forces, in Mechanics.** See Compound Motion.

**Balance, in the Accounts of Merchants,** is, when the debtor and creditor sides of any distinct account are equal. In such case the account is said to be balanced.

Balance of a merchant, or trader's books, is a branch of the art of accountancy. In the method of keeping the books of traders, according to that excellent art of charge and discharge by double entry, such books, if correctly kept, will always be fit for a general balance. For such is the excellence of that method, that the books of themselves must necessarily balance on the whole, though not in every distinct account throughout the ledger. See Book-keeping.

**Balance, among Painters.** See Equilibrium.

**Balance of the Constitution, in Political Economy,** denotes the security which each part of the legislature possesses in the exercise of the powers assigned to it from the enfranchisement of the other parts. The political equilibrium signified by this phrase, conflicts in two contrivances, viz. a balance of power, and a balance of interest. By the former is meant, that there is no power profited by one part of the legislature, the abuse or excess of which
is not checked by some antagonistic power, residing in another part. Thus the power of the two houses of parliament to frame laws is checked by the king's negative; on the other hand the arbitrary application of this negative is checked by the privilege that parliament possesses of refusing supplies of money to the exigencies of the king's administration. The constitutional maxim, "that the king can do no wrong," is balanced by another maxim not less constitutional, "that the illegal commands of the king, do not justify those who assail, or concur, in carrying them into execution;" and by a second rule, subsidiary to this, "that the acts of the crown acquire not any legal force, until authenticated by the subscription of some of its great officers." The power of the crown to direct the military force of the kingdom is balanced by the annual necessity of referring to parliament for the maintenance and government of that force. The power of the king to declare war is checked by the privilege of the house of commons to grant or withhold supplies by which the war must be carried on. The king's choice of ministers is controlled by the obligation he is under of appointing those men to offices in the state, who are found capable of managing the affairs of his government with the two houses of parliament. By the balance of interest, which accompanies and gives efficacy to the balance of power, is meant this, that the respective interests of the three states of the empire are so disposed and adjusted, that whichever of the three shall attempt any encroachment, the other two will unite in refuting it. If the king shall endeavour to extend his authority by contracting the power and privileges of the commons, the house of lords would see their own dignity endangered by every advance which the crown made to independency, upon the resolutions of parliament. The admission of arbitrary power is no less formidable to the grandeur of the aristocracy than it is fatal to the liberty of the republic; that is, it would reduce the nobility from the hereditary share they possess in the national councils, in which their real greatness consists, to being a part of the empty pagentry of a despotic court. On the other hand, if the house of commons should intrench upon the distinct province, or usurp the established prerogative of the crown, the lords would receive an instant alarm from every new stretch of popular power. In every contest in which the king may be engaged with the representative body, in defence of his established share of authority, he will find a safe ally in the collective power of the nobility. If the nobles should attempt to revive the superiorities exercised by their ancestors under the feudal constitution, the king and the people would alike remember how the one had been infituted, and the other enlaced by that barbarous tyranny. Paley's Principles of Philosophy, vol. ii. p. 268—212.

Balance of Power, in the Political System, originates from, and is maintained by, the alliances of different nations; as their circumstances and interest may require. See this subject at large under the article Power.

Balance of Trade, denotes an equality between the value of commodities bought of foreigners, and the value of the native productions transported into other nations.

The balance of trade with any foreign nation is said to be against or in favour of the country simply as it tends to carry money out, or to bring it in; that is, according as the price of the imports exceeds or falls short of the price of the exports; so invariably is the increase or diminution of the species of a country regarded as a test of the public advantage or detriment, which arises from any branch of its commerce. According to Dr. Smith (Wealth of Nations, vol. ii. p. 212.), there is no certain criterion by which we can determine on which side what is called the balance between two countries lies, or which exports to the greatest value. The two criterions to which an appeal has been usually made on such occasions are, thecustom-houses, and the court of exchange. The custom-houses, says this writer, are now generally acknowledged to be a very uncertain criterion, on account of the inaccuracy of the valuation at which the greater part of goods is rated in them; and the court of exchange is, perhaps, almost equally precarious.

Balance of Annual Produce and Consumption, is that which, according to Dr. Smith (ubi supra, p. 250.), necessarily occasions the prosperity or decay of every nation, as it happens to be either favourable or unfavourable. If the exchangeable value of the annual produce exceeds that of the annual consumption, the capital of the society must annually increase in proportion to the excess. The society in this case lives within its revenue, and what is annually saved out of its revenue is naturally added to its capital, and employed so as to increase still further the annual produce. On the contrary, if the exchangeable value of the annual produce fall short of the annual consumption, the capital of the society must annually decay in proportion to this deficiency. The expense of the society in this case exceeds its revenue, and necessarily encroaches upon its capital. Its capital must, therefore, necessarily decay, and together with it, the exchangeable value of the annual produce of its industry. The balance of produce and consumption is entirely different from that which is called the balance of trade. It might take place in a nation which had no foreign trade, but which was entirely separated from all the world. It may take place in the whole globe of the earth, of which the wealth, population, and improvement may be either gradually increasing, or gradually decaying. This balance may be constantly in favour of a nation, though the balance of trade should be generally against it. A nation may import to a greater value than it exports for half a century, perhaps, together; the gold and silver which come into it during all this time may be immediately sent out of it; its circulating coin may gradually decay, and different sorts of paper money being debilitated in its place, and even the debts too which it contracts in the principal nations with which it deals may be gradually increasing; and yet its real wealth, the exchangeable value of the annual produce of its lands and labour, may, during the same period, have been increasing in a much greater proportion. See on this subject more largely under the articles Commerce and Trade.

Balance, in Sea Language, signifies to contract a fall into a narrow compass, in a storm, by retrenching, or, folding up a part of it in one corner. To this purpose serves the balance-reef, which is a reef-band that crosses the fall diagonally. See Reef.

Balance of the Beam Mainsail, is performed after all its reefs are taken in, by rolling up a similar portion of the headsail, or aftmost lower corner called the ear, and fastening it strongly to the boom, securing it from being fretted by the cord that fastens it. See Boom.

Balance of the Mizen, is thus performed; the mizen-yard is lowered a little, a small portion of the sail is rolled up at the peak, or upper corner, and fastened to the yard, about one-fifth inward from the outer end, or yard-arm, towards the mast. See Mizen.
BALANCE-Fish, in Ichthyology, an English name of the figulus synnes of Linnæus and Gmelin. It is also called by some the hammer-fish, or hammer-baited fish, from the very singular form of the head; and its specific character is taken exclusively from that particular; head very broad, transversely, and hammer-shaped. Savilian calls it libella ciamabatia; and Belon libella, balista, cagnola, &c. See ZYGENA SQUALUS.

BALancers, or Poizers, in Entomology, a term synonymous with the French word balanciers, and balarees of Linnæus; denoting those little filamentous bodies which terminate in a round, truncated, or oval capitulum, or knob; and of which one is placed on each side of all the diterous, or two-winged insects, immediately under a small scale or arch, below the wing. In different genera these vary a little in respect of situation, and are also of larger or smaller size in proportion to the other parts of the insect in different kinds.

The use of these organs is by no means obvious. Some imagine that they beat the little arch or scale, beneath which they are situated, in the motion of flying, and thereby occasion that humming or buzzing noise, which every one must have observed the house-fly, flesh-fly, and other very common two-winged insects to emit in flight. The cicada, we well know, make a like noise by means of somewhat similar organs under the handle, but whether the noise which the diterous insects make is occasioned in this manner or not, we shall not presume to say. Olivier thinks it is not, because it appears from certain experiments, that when any of these insects are deprived of the balancers, and are permitted to refuse their flight, the same buzzing sound is heard without the flighted variation. The more general opinion is, that they are designed to facilitate the motion of the creature in the air, by equilibrising, or preferring the true equilibrium, just as a stick, made heavy at each end, is held by rope-dancers to preserve their balance, and hence these organs have been called the balancers. This is most probably the real use of the balancers, notwithstanding that their diminutive size is some objection to such opinion, for when these are accidentally injured, the motion of the creature becomes very irregular, and it evidently appears unable to direct its course with the same facility as before; either suffering great pain, or being deprived of the means it previously possessed.

BALANCER, a machine used in the striking of coins, medals, counters, and the like. See Coinage.

BALANTUS, in Ancient Geography, a town seated on the coast of Syria, between the towns of Gabala and Antinodes; convenient for commerce, and furnished with grain and fruits in abundance. Strabo, Pliny, and Ptolemy place it in Syria, properly so called; to the north of the river Euphrates, which separated Syria from Phrygia. Under the reign of Theodorus the younger, this town was compred in the province called Syria secunda: but afterwards belonging to a new province which the emperor Julian formed under the name of Thedodiacia.

BALANITES, in Natural History, a name given by the ancients to a stone, seeming to have been of the sapphire kind. They describe two species of it; the one of which was yellow, and the other green, but each having veins of a flame colour. Their descriptions are too short for us to be able to ascertain what stones, among those known at this time, they meant.

Some think the balantiæ to have been the lapis Judæicus, on account of its acorn-like figure and size. Plin. Nat. Hist. lib. xxi. cap. 10. ed. Hardouin.

BALANOIDES, in Conchology, a species of LEPIAS, with a conic truncated smooth shell, and obtuse operculum. Linna. Fa. Succ.—Donov. &c. This is balanus parvus vulgaris of Petiver; and a variety of it with a long tubular flalk is described by Da Costa, Pennant, and Donov. Brit. Shells.

BALANTE, in Geography, a town of the island of Cebes, in the country of Bacula.

BALANUS, in Conchology, the name of a genus of multivalve shells, in the works of several writers on the teufaces, as Petiver, Cates, Da Costa, &c. The shells of this kind are comprehended by Linnæus and Gmelin in the genus LEPIAS, which see.

BALANUS, a species of LEPIAS, with a conic falcated shell, and sharp-pointed operculum. Found adhering to rocks, stones, shells, &c. in the general plenty in all the European seas. Linna. Fa. Succ.—Donov. Brit. Shells, &c.

BALANUS, Balanus, or Glans, is sometimes used by Antonyfus for the nut of the yard. Sometimes also the cithoras is so called.

BALANUS is also sometimes used for a suppository.

BALANUS MYRTEUSIS, in Pharmacy, the Ben-nut, which see.

BALANUS, in Geography, the name of a port in Italy, in Lucania.

BALARA, in Ancient Geography, a commercial city, seated on the coast of the Indian ocean, between the mouth of the Indus and that of the Euphrates. Philostratus.

BALARUC, in Geography, a town of France, celebrated for its mineral springs, in the department of the Herault, four leagues from Montpellier.

BALARUC, Waters of. These are hot springs of some celebrity, employed both internally, and especially as baths. From the description and analysis of Le Roy (in the Memoires de l'Academie des Sciences for 1772), they appear to contain a small portion of sea salt, some fixed air, and some delectuous waters, but no iron nor sulphur. They are limpid, and fatal to the taste. Their temperature when fresh is about 123° Fahr.; but they are cooled down to about 115° before they are used.

BALASCHIEV. See Balakoff.

BALASORE, a sea-port town of Hindostan, in the country of Orissa, and a place of considerable trade, seated on the river Ganges, about twenty miles from its mouth in the bay of Bengal. Ships generally take pilots here to carry them up the Ganges. It is about 101 geographical miles S.W. from Calcutta. N. lat. 21° 20'. E. long. 87° 17' 30".

BALASS, BALLAS, or BALAS, in Mineralogy. See Ruby.

BALATAM, in Geography, a volcanic mountain in the island of Sumatra.

BALATITI, in Ornithology, a name given by the people of the Philippine islands to a kind of bird, by the flight of which they divine the event of things. What bird this is has not been ascertained.

BALAUSTINA, in Conchology, a species of Tellina, having the shell dilated, orbicular, and one valve furnished with lateral teeth. Inhabits the Mediterranean sea. Colour white, with obscure rufous rays. Size of a lupine seed.

BALAUSTIUM FLORES, BALAUSTIUM FLORES, the flowers of punica graminaria, or pomegranate tree. These are large rose-like flowers of a deep red colour, set in long, bell-shaped cups, and are brought from the southern parts of Europe. They are mildly astringent, as indeed is the whole of the
pomegranate, and will strike a black with solutions of iron. They have little or no smell, and readily yield their astrigent virtue to watery or spirituous menstrua. An extract was formerly prepared from the halalines, and it entered into some of the official powders. It is now almost, if not entirely, disused.

BALAYAN, in Geography, a district or province in the island of Manila or Luzon, with a town of the same name. It lies near the city of Manila, and extends along the coast on the call side of the island, inhabited by about 25,000 tributary Indians, and abounds in cotton, rice, and palm-trees.

BALASTRE, Claude, in Biography, an eminent organist at Paris, and a spirited composer, of the old school, for keyed-instruments. He was born at Dijon, 1720, and was a favourite disciple of Rameau, and organist of Notre-Dame and S. Roch. He was a zealous cultivator of his art, and suggested to harpichord and piano-forte makers many improvements.

BALASTRO, in Geography, an episcopal town of Spain, in Arragon, seated on the Vero, near its confluent with the Cinca, with a diocese extending over 170 parishes, forty-seven miles N.W. of Barcelona, and forty E.N.E. of Saragossa. N. lat. 41° 50'. E. long. 0° 20'.

BALLEC, Ballec, or Balbec, a famous city of Syria, in the parish of Sable, celebrated by the Greeks and Latins under the name of Helipolis, or the city of the fun; defended by the Arabians as the wonder of Syria, and denoting by its present Arabic name Balkh, 1. e. the name of Bel, its connection with the worship of the fun, of which Baal, the chief idol deity of the country, was an appropriate denomination. It is pleasantly situated near the north-east extremity of the valley of Buen, or Bekaa, at the foot of mount Anti-Lebanus, on the left rising ground where the mountain terminates in the plain; it is well watered by the Litane, rising from Anti-Lebanus, and the Barounni from the foot of Lebanon, and abounds in gardens. It is of a square figure, extending as Munnadell conjectured (Journey from Aleppo to Jerusalem, p. 133), about two furlongs on each side: and its houses are of the meanest structure, being such as are usually seen in Turkish villages. Its distance from Damascus is about fifty miles to the north-west, and about thirty miles from the nearest sea-coast, which is the situation of the ancient Byblos, N. lat. 34°. E. long. 36° 45'.

As we arrive from the south (says Volney, Travels in Egypt and Syria, vol. ii. p. 222, &c.) we discover the city at the distance of only a league and a half, behind a hedge of trees, on the verdant tops of which appears a white edging of domes and minarets. After an hour's journey we reach these trees, which are very fine walnuts; and soon after, crossing some ill-cultivated gardens, by winding paths arrive at the entrance of the city. We there perceive a ruined wall, flanked with square towers, which affords the decivity to the right, and traces the pre-
cincts of the ancient city. This wall, which is only ten or twelve feet high, permits us to have a view of those void spaces, and heaps of ruins which are the invariable appendage of every Turkish city; but what principally attracts our attention, is a large edifice on the left, which, by its lofty walls, and rich columns, manifestly appears to be one of those temples which antiquity has left for our admiration. These ruins, which are the fame of the most beautiful and best preserved of any in Asia, merit a particular description.

To give a just idea of them, we must suppose ourselves defending from the interior of the town. After having crossed the rubbish and huts with which it is filled, we arrive at a vacant place, which appears to have been a square; there, in front towards the west, we perceive a grand ruin, which consists of two pavilions ornamented with pilasters, joined at their bottom angle by a wall 165 feet in length. This front commands the open country from a fort of terrace, on the edge of which we distinguish, with difficulty, the bases of twelve columns, which formed extended from one pavilion to the other, and formed a portico. The principal gate is obstructed by heaps of stones; but that oblique form, we enter an empty space, which is a hexagonal court of 180 feet in diameter. This court is surrounded with broken columns, mutilated capitals, and the remains of pilasters, entablatures, and consoles; around is a row of ruined edifices, which display all the ornaments of the rich cell architecture. At the end of this court, opposite the well, is an outlet, which formerly was a gate through which we perceive a still more extensive range of ruins, whose magnificence strongly excites curiosity. To have a full prospect of these, we must ascend a steep, up which were the steps to this gate; and we then arrive at the entrance of a square court, much more spacious than the former. The eye is first attracted by the end of this court, where its enormous and majestic columns render the scene alcmomingly grand and picturesque. Another object not less interesting, is a second range of columns to the left which appear to have been part of the peril of a temple; but before we pass through, we cannot refuse particular attention to the edifices, which enclose this court on each side. They form a fort of gallery which contains various chambers, seven of which may be reckoned in each of the principal wings; viz. two in a semicircle, and five in an oblong square. The bottom of these apartments still retains pediments of niches and tabernacles, the supports of which are destroyed. On the side of the court they are open, and present only four and fix columns, totally destroyed. It is not easy to conceive the size of these apartments; but this does not diminish our admiration at the beauty of their pillars, and the rich seen of the frieze of the entablature. Neither is it possible to avoid remarking the singular effect which results from the mixture of the garlands, the large foliage of the capitals, and the sculpture of wild plants with which they are every where ornamented. In traversing the length of the court, we find in the middle a little square esplanade, where was a pavilion, of which nothing remains but the foundations. At length we arrive at the foot of the fix columns; and then first conceive all the boldness of their elevation, and the richness of their workmanship. Their shafts are twenty-one feet eight inches in circumference, and fifty-eight high; so that the total height, including the entablature, is from seventy-one to seventy-two feet. The fitness of this superb ruin, thus solitary and unaccompanied, at first strikes us with astonishment; but on a more attentive examination, we discover a series of foundations, which mark an oblong space, 256 feet in length, and 146 wide; and which, if it seems probable, was the periphery of a grand temple, the primary purpose of this whole structure. It presented to the great court, that is to say, a front of ten columns, with nineteen on each side, which, with the other fix, make in all fifty-four. The ground on which it stood was an oblong square, on a level with this court, but narrower than it, so that there was a terrace of twenty-seven feet wide round the colonnade. The esplanade this produces, fronts the open country, toward the well, by a lining wall of about thirty feet. This descent, as you approach the city, becomes less steep, so that the foundation of the pavilion is on a level with
with the termination of the hill, whence it is evident that the whole ground of the court has been artificially raised. Such was the former state of this edifice; but the southern side of the grand temple was afterwards blocked up to build a smaller one, the peristylium and wall of which are still remaining. This temple, however, some feet lower than the other, presents a side of thirteen columns, by eight in front (in all thirty-four), which are likewise of the Corinthian order; their shafts are fifteen feet seven inches in circumference, and forty-four in height. The building itself is round an oblong, square, the front of which, facing the sea, is out of the line of the left wing of the great court. To reach it you must first traverse the courts of columns, built by Emperor Julian, and a ruined wall by which it is now hid. After surmounting these obstructions, you arrive at the gate, where you may survey the inclosure which was once the habitation of a god; but instead of the awful scene of a prostrate people, and sacrifices offering by a multitude of priests, the sky, which is open from the falling in of the roof, only lets in light to throw a show of ruins, covered with dust and weeds. The walls, formerly enriched with all the ornaments of the Corinthian order, now present nothing but pediments of niches, and tabernacles of which almost all the supports are fallen to the ground. Between these niches is a range of fluted pilasters, whose capitals support a broken entablature; but what remains of it, displays a rich frieze of foliage rolling on the heads of fayts, horses, bulls, etc. Over this entablature was the ancient roof, which was fifty-seven feet wide, and 110 feet in length. The walls which supported it are thirty-one feet high, and without a window. It is impossible to form any idea of the ornaments of this roof, except from the fragments lying on the ground; but it could not have been richer than the gallery of the peristylium; the principal remaining parts contain tablets in the form of lozenges, on which are represented Jupiter seated on his eagle; Leda carried by the swan; Diana with her bow and crescent, and several busts which seem to be figures of emperors and empresses. It would lead us too far, to enter more minutely into the description of this abominable edifice. The lovers of the arts will find it described with the greatest truth and accuracy in a work published at London in 1757, under the title of "Ruins of Balbec." This work, compiled by Mr. Robert Wood, the world owes to the attention and liberality of Mr. Dawkins, who, in 1751, visited Balbec and Palmyra. It is impossible to add any thing to the fidelity of their description.

Several changes, however, have taken place since their journey: for example, they found nine large columns standing; and, in 1784, there were but five. They reckoned nine and twenty at the lefier temple, but there now remain but twenty; the others have been overthrown by the earthquake of 1759. It has likewise shaken the walls of the lesser temple, that the stone of the soffit of the gate has slid between the two adjoining ones, and defended eight inches; by which means the body of the bird, sculptured on that stone, is suspended, detached from its wings, and the two garlands, which hang from its beak and terminated in two genii. Nature alone has not affected this devastation; the Turks have had their share in the destruction of the columns. Their motive is to procure the iron cramps, which serve to join the several blocks of which each column is composed. These cramps suffer no little from the war intended, that several of the columns are not even disjointed by their fall; one, among others, as Mr. Wood observes, has penetrated a stone of the temple wall without giving way. Nothing can surpass the workmanship of these columns; they are joined without any cement, yet there is not room for the blade of a knife between their interludes. After so many ages, they in general still retain their original whiteness. But, what is still more astonishing is, the enormous stones which compose the foping wall. To the west, the second layer is formed of stones which are from twenty-eight to thirty-five feet long, by about nine in height. Over this layer, at the north-west angle, there are three stones, which alone occupy a space of 175 feet and one half; viz. the fifth, fifty-eight feet seven inches; the second, fifty-eight feet eleven; and the third, exactly fifty-eight feet; and each of these are twelve feet thick. These stones are of a white granite, with large shining flakes, like gypse; there is a quarry of this kind of stone under the whole city, and in the adjacent mountains, which is open in several places, and, among others, on the right, as we approach the city. There is still lying there a stone, hewn on three sides, which is sixty-nine feet two inches long, twelve feet ten inches broad, and thirteen feet three in thickness. By what means could the ancients move these enormous masses? This is doubtless a problem in mechanics curious to resolve. The inhabitants of Balbec have a very commodious manner of explaining it, by supposing these edifices to have been constructed by Djemoun, or Genni, who obeyed the orders of King Solomon; adding, that the motive of such immense works was to conceal, in subterraneous caverns, vast treasures, which shall remain there. To discover these, many have descended into the vaults which range under the whole edifice; but the inutility of their researches, added to the oppressions and extortions of the governors, who have made their suppressed discoveries a pretext, have at length discouraged them; but they imagine the Europeans will be more successful; nor would it be possible to persuade them, but what we are possessed of the magic art of destroying Talismans. It is in vain to oppose reason to ignorance and prejudice; and it would be no less ridiculous to attempt to prove to them that Solomon never was acquainted with the Corinthian order, which was only in use under the Roman emperors. The tradition which ascribes the buildings at Balbec, and also at Palmyra, to Solomon, and on which the inhabitants of the country confidently rely, is founded on an opinion generally prevalent, of his wisdom and love of pleasure, with both which the magnificence, beauty, and disposition, of these buildings perfectly agree; and on the mention of 'Tadmor' in the wilderness, and the tower of Lebanon looking towards Damascus, which are said in the Old Testament to have been built by his direction. Some have supposed that these are the ruins of a temple of the sun, built by the Phœnicians, because it is certain that the sun was worshipped at this place when the Phœnicians were in their most flourishing state. Others have thought that these buildings were erected by the Greeks, who succeeded the Phœnicians in the possession of this country, because they are of the Corinthian and Ionic order; but as they are not mentioned from the time of Alexander's conquest to that of Pompey, there is great reason to suppose that they are of later date.

When we consider the extraordinary magnificence of the temple of Balbec, we cannot but be astonished at the silence of the Greek and Roman authors. Mr. Wood, who has carefully examined all the ancient writers, has found no mention of it, except in a fragment of John of Antioch, named Malala, who attributes the building of this edifice to Antoninus Pius. He says that this emperor 'built a great temple to Jupiter at Heliopolis, near Libanus, in Phœnicia, which was one of the wonders of the world.' This is the only historical authority that has yet been discovered.
covered relating to this subject. As these buildings seem to have been erected between the time of Pompey and Caracalla, it is very probable that they were the work of Antoninus Pius. The inscriptions which remain corroborate this opinion, which perfectly accounts for the common use of the Corinthian order, since that order was not in general use before the third age of Rome; but we ought by no means to allege as an additional proof, the bird sculptured over the gate, for if his crooked beak, large claws, and the caduceus he bears, give him the appearance of an eagle, the tuft of feathers on his head, like that of certain pigeons; proves that he is not the Roman eagle: besides that the same bird is found in the temple of Palmyra, and is therefore evidently an oriental eagle, consecrated to the sun, who was the divinity adored in both these temples. His worship excelled at Balbec, in the most remote antiquity. His statues, which resembled that of Osiris, had been brought thither from the Heliopolis of Egypt, and the ceremonies with which he was worshipped there have been described by Macrobius, in his curious work, intitled, "Saturnalia." Mr. Wood supposes, with reason, that the name of Balbec, which in Syrian signifies City of Baal, or of the Sun, originated in this worship. The Greeks, by naming it Heliopolis, have in this instance, only given a literal translation of the oriental word, a practice to which they have never always adhered. We are ignorant of the date of this city in remote antiquity; but it is to be presumed that its situation, on the road from Tyre to Palmyra, gave it some part of the commerce of those remote capitals. Under the Romans, Heliopolis was constituted a colony by Julius Cesar, and in the time of Augustus, it is mentioned as a garison town, for it received part of the veterans of the fifth and eighth legions; and there is still remaining, on the wall of the southern gate on the right, as we enter, an inscription which proves the truth of this, the words "Kerturin Primus," in Greek characters, being very legible. One hundred and forty years after, Antoninus built there the present temple, instead of the ancient one, which was doubtless falling into ruins; but Christianity having gained the ascendancy under Constantine, the modern temple was neglected, and afterwards converted into a church, a wall of which is now remaining, that hid the sanctuary of the idol. It continued thus until the invasion of the Arabs, when it is probable they enroved the Christians so beautiful a building. The church being left frequented, fell to decay; years succeeded, and it was converted into a place of defence; battlements were built on the wall which surrounded it, on the pavilions, and at the angles, which still stand; and from that time, the temple, exposed to the ravages of war, fell rapidly to ruin. The date of the city is not left deplorable: the wretched government of the Emirs of the house of Huxfonie had already greatly impaired it; and the earthquake of 1759 completed its destruction. The wars of the Emir Youlef, and Djezzar, have rendered it still more deserted and ruinous: of 5000 inhabitants, at which number they were estimated in 1751, not 1200 are now remaining, and all those poor, without industry or commerce, and cultivating nothing but a little cotton, some maize, and water-melons.

BALBI, John, in Biography, a learned Dominican monk of the thirteenth century, was born at Genoa, and hence called "Balbi-jannensis;" and distinguished as the author of a grammatical work, intitled "Catachiron," published in 1276, and entitled to attention principally from its having been one of the first printed books. It was printed in folio at Mento, in 1460; and this edition is become very scarce.

BALBIAN, Justus, of Aloft, in Flanders, studied at Padua, where he was admitted doctor in medicine, which he practiced with considerable reputation, towards the latter end of the sixteenth century, at Gouda. He openly professed the Calvinistic religion, in which faith he died in 1616, and was buried in the principal church of that city, with the following inscription on his tomb:

Singular diee, singularis vites puta,
Justa a Balbian,
[sepulchrum :
Flandi Aloliani, Philo-Chymici, ejufque hereditum
ille heri, ego hodie, tu caras.
Obit anno 1616.

BALBINUS, Decimus Cerialis, a Roman emperor, was a descendant of a noble family, founded by Cornelius Balbinus Theophanes, originally of Cadiz in Spain, who was the friend and historian of Pompey, and admitted into the freedom of the city under his patronage. Balbinus was distinguished both as a poet and an orator; and as a magistrate he had governed several provinces with reputation. His fortune was sufficient, and his manners liberal and affable. After the defeat and death of the two Gordians, on the 3d of July, A.D. 237, Balbinus was elected emperor by the senate in conjunction with Maximus. Their election was soon succeeded by a tumult at Rome, occasioned by a licences multitude: who neither loved the rigid Maximus, nor sufficiently feared the mild and humane Balbinus; and who, surrounding the temple of Jupiter, demanded, that, besides the two emperors chosen by the senate, a third should be added of the family of the Gordians, as a just return of gratitude to those princes who had sacrificed their lives for the republic. Accordingly, Maximus and Balbinus being driven back into the capital, a boy, thirteen years of age, the grandson of the elder, and nephew of the younger Gordian, was presented to them, and invested with the title and ornaments of Caesar. The tumult was appeased by this easy accommodation; and the two emperors, as soon as they had been peaceably acknowledged in Rome, prepared to defend Italy against the common enemy. Maximus marched against Maximin, who was then laying siege to Aquileia; but this tyrant having been abounded by his guards, and affaminated in his tent, Maximus returned in triumph to Rome, and was received with cordial congratulations, not only by his colleague and young Gordian, but by the senate and the people, who perfused themselves that a golden age would succeed an age of iron. The conduct of the two emperors corresponded with these expectations. The rigour of the one was tempered by the clemency of the other: the oppressive taxes imposed by Maximin were repealed or moderated, discipline was revived, and many salutary laws were enacted. "What reward," said Maximus, "may we expect for delivering Rome from a monster?" To which question Balbinus replied, "the love of the senate, of the people, and of all mankind." "Alas!" rejoined his more penetrating colleague, "Alas! I dread the hatred of the soldiers, and the fatal effects of their resentment." His apprehensions were justified by the event. At length dissensions broke out between the two emperors, and they were thus prevented from uniting in any vigorous measures of defence against their common enemies of the Prætorian camp. These fierce troops, proceeding to an open revolt, seized on both the emperors, stripped them of their garments, dragged them
them ignominiously through the streets of Rome, and terminated the tragedy by infamously massacring them. Thus they both fell after a reign of little more than a year, July 15th, A. D. 1515. Crozier's Hist. Emp. vol. viii. p. 322. &c.

Gibbon's Hist. vol. i. p. 290—305

BALBOA, Vasco Núñez De, a famous Spanish adventurer, was a native of Cadiz; and one of those who formed a settlement in Hispaniola. In 1510, he commanded a feeble colony, established at Santa Maria Antigua, or the ancient, so called because it was the first settlement on the southern continent of America. Aroused for being involved with a legal title to the supreme command, he dispatched one of his officers to Spain, in order to solicit a royal commission; and with a view of more efficaciously recommending himself to the patronage which he was endeavouring to obtain, he made frequent visits into the adjacent country, furnished several of the caciques, and collected a considerable quantity of gold, which abounded more in that part of the continent than in the islands. In one of his expeditions he met with a young cacique, who expounded his affrontment at the high value which was set upon the gold, which the Spaniards were weighing and distributing:

"Why do you quarrel," said he, "about such a trifle? If you are so passionately fond of gold, as to abandon your own country, and to disturb the tranquillity of distant nations for its sake, I will conduct you to a region where the metal, which seems to be the chief object of your admiration and desire, is, so common that the mercenary utopians are formed of it." Transported with the intelligence, Balboa eagerly inquired where this happy country lay, and how they might arrive at it. The cacique informed them, that at the distance of six fars, or six days journey to the south, they would discover another ocean, near which this wealthy kingdom was situated; but if they intended to attack it, they must assemble forces far superior in number and strength to those which now attended them. This was the first information which the Spaniards received concerning the great southern continent known afterwards by the name of Peru. Balboa diligently prepared for the enterprise; and procuring talents for conducting so hazardous and almost desperate an undertaking as that of marching across the island of Dwien, he arranged his troops, amounting upon a muster to only 150 men, who were hardy veterans, that had been induced to the climate of America, and who were ready to follow him through every danger. A thousand Indians attended them to carry their provisions; and to complete their warlike array, they took with them several of those fierce dogs which were no less formidable than destractive to their naked enemies. On the 18th of September, A. D. 1513, he set out on this expedition; and having continued their progress for 25 days through woods and mountains, and amidst contending enemies, he at length reached the top of a mountain from which he was able to discover the ocean, which was the object of their wishes. On viewing this glorious spectacle, which no European eye had ever before beheld, he fell on his knees, and returned thanks to heaven with uplifted hands for conducting him to a discovery so beneficial to his country, and so honourable to himself. His followers united with him in expressions of wonder, exultation, and gratitude. Pursuing their course, they at length arrived at the shore of the ocean; when Balboa, advancing into the waves with his sword and buckler, took possession of it in the name of the king his master, and vowed to defend it with these arms against all his enemies. The part of the great Pacific, or Southern ocean, which Balboa first discovered, still retains the name of the gulf of St. Michael, which he gave to it, and is situated to the coil of Panama.

Here he obtained a supply of provisions; and partly by force and partly by gift, he enriched himself with a considerable quantity of gold and pearls. He also received information that there was a mighty and opulent kingdom situated far towards the south, where the inhabitants had tame animals, making the Llamaroas, or stalwart men, to carry their burdens. His followers were also supplied with fan-tigue and discipline; and he therefore determined to lead them back, instead of attempting to take possession of this country, to their settlement at Santa Maria in Darien; and, after an absence of four months, he returned to it with greater glory and more treasure than the Spaniards had hitherto acquired in any of their expeditions against the New World. Balboa hastened to transmit information of his important discovery to Spain, and to solicit a reinforcement of 1000 men for the conquest of the opulent country, of which he had received so favourable an account. Ferdinando, the king of Spain, determined to avail himself of the intelligence which Balboa had communicated; but regardful of his merit, he appointed Pedrarias Dávila to supersede him in the government of Darien. He also provided him with a well equipped fleet and 1500 followers, who were joined by a great number of volunteers and vassals. Upon their arrival at Darien, they found Balboa, whose fame had reached Spain, and of whose uprightness they had formed such high ideas, clad in a canvas jacket, with cotton breeches, and Rudolph, and employed in thalving his own tent with reds. Balboa, however, received them with dignity, and treated Pedrarias with the deference due to his character. Pedrarias appointed a judicial inquiry to be made into Balboa's conduct, and imposed upon him a considerable fine. At length remonstrance against the imprudent government of Pedrarias, which had ruined a happy and flourishing colony, and Pedrarias reprimanded by accusing him of having deceived the king, by magnifying his own exploits, as well as by a false representation of the opulence and value of the country. Ferdinando, sensible of his own imprudence in having superseded Balboa, appointed him Admiral and lieutenant-governor of the countries upon the South sea, with very extensive privileges and authority; and he enjoined Pedrarias to avail himself of Balboa's counsel in all his operations. After some time Pedrarias and Balboa were apparently reconciled; and by way of cementing the union between them, the former agreed to give his daughter in marriage to the latter. This happened in 1515. Jealously still mired in the breach of the governor, and when Balboa had engaged in a laborious fluted four small brigantines, and provided 1500 choicest men, in order to fall towards Peru, Pedrarias desired him to postpone the voyage; and having solicited an interview, ordered him to be arrested, and then to be tried for an accusation of disloyalty to the king, and of an intention to revolt against the governor. He was found guilty, and sentence of death was pronounced; and though the judges who passed it, recoiled by the whole colony, warmly interceded for his pardon, the governor continued inexorable; and the Spaniards beheld, with astonishment and sorrow, the public execution of a man whom they universally deemed more capable than any who had borne command in America, of forming and accomplishing great designs. Upon his premature death in 1517, at the age of
BAL

42: the expedition, which he had planned, was relinquished.

Bala was distinguished among his countrymen by a variety of important and useful qualities, adapted to the station he occupied, and the services in which he engaged. Besides bravery, which he purchased in an eminent degree, he was prudent in conducting himself, affable, and popular with those of his rank, in which, in the most desperate undertakings, inspired confidence and secured attachment. Robertson's Hist.

Amer. vol. i. p. 257—301.

BALBRIGG&N, in Geography, a small port town of Ireland, in the county of Dublin. It has a safe harbour with a pier, within which ships of 200 tons burden may lay their broadside, and unload on the quay. The base of the pier is 18 feet thick, and on the outside is a considerable rampart of large fragments of rock, fink to defend the pier against the waves. At this town there once was an extensive cotton factory; but it has lately declined so much that the proprietors are now converting one of their principal cotton mills into a flour mill. Many of the inhabitants derive a subsistence from fishing, in which nine wharves are employed. On the shore near the town is a fine rock, which is a good quarter for blocks of sufficient size for making ton flutes. It is distant from Dublin 135 Irish miles. N. lat. 53° 36'. W. long. 13°.

BALBUL, in Ornithology, a species of Anas, or duck, having a black back, and spot of the wing above obliquely green, beneath obliquely black. Forck. Fin. Arab.

BALBURA, in Ancient Geography, town of Acha Minor, in Cœlia, a country of Cariu, situated in the vicinity of Cythera Major. When the prefect Muræus extended the principality of Cythera, Balbara was annexed to Lycaia.

BALBUS, a mountain of Africa, between the town of Chypoca, the territory of Cartagia, Numidia, and the sea. Hitherto Masumilla retired, after having been defeated by Syphax, king of Numidia.

BALBUSARDUS, in Ornithology. See BAL-BUZZARD.

BALCASH, Tents, or Palati, in Geography, a lake of Independent Tartary, in the country of the Kalmsaks, subject to China, is about 140 Britsh miles in length by half that breadth; being the largest lake in Asia, next to the seas of Aral and Balaik.

BALCUDPHA, a settlement in the eastern part of Kentucky, in America, on the west side of the Big Sandy river.

BALCH, a river of Germany, which runs into the Rhine at Cologne.

BALCHIKANSKOI, a town of Siberia, 140 miles south-west of Doronimik.

BALCHYSEN, a town of Germany, in the circle of Weilphalia, and duchy of Juliers, nine miles west of Cologne.

BALCONY, from the French balcon, in Architecture, a kind of open gallery without the walls of buildings, contrived chiefly for the convenience of looking around, facing processions, cavalcades, and the like.

Where there is but one, it is usually in the middle of the front of the edifice, and level with the first floor; sometimes they are made of wood, sometimes of cast iron; the former surmounted with a rail or balustrade, the latter wrought in various figures in demi-reliefs. Some are also made of bar iron, fashioned in chain-work, or flourishes of divers fancies.

BALCONY, in a ship, denotes a gallery either covered or open, made abaft, either for ornament or convenience of the captain's cabin.

BALDA, in Ancient Geography, a town of Hifpania Baetica, in the country of the Tartulii. Ptolemy.

BALDACANIFER, corruptly also written balacanifer, denotes a standard-bearer; chiefly in the ancient order of knights Templars.

BALDACHIN, or Balduinus, in Architecture, a building in form of a canopy, supported with columns, and serving as a crown or covering to an altar.

The word comes from the Italian baldacchino, which signifies the same.

BALDACHIN, or Baldhin, or Bal'dkin, popularly Bau-dekin, in Middle Age Writers, denotes a rich kind of cloth made of gold warp and silk woof, variously figured. It took the denomination from its being formerly brought into these countries from Balconia, or Babylon.

BALD-BOZZARD, in Ornithology, the name under which Falco spartus is described by Willughby and other English naturalists. It is also called balacard by Buffon.

BALD-EAGLE, in Geography, or Warrior Mountains, lie about 250 miles W. of Philadelphia, in the county of Bedford, in Pennsylvania, and form the western boundary of Bald-eagle valley.

BALD-EGLE is also a river which runs a north-east course forty-four miles, and falls into the western branch of the Susquehanna river. The water of Huron river, which falls into the lake Erie, is called Bald-eagle creek.

BALD-EAGLE, Valley, or Sinking-Spring Valley, lies upon the frontiers of Bedford county in Pennsylvania, about 250 miles west of Philadelphia. On the east it has a chain of high rugged mountains, called the "Came ridge," and on the west, the "Bald-eagle," or Warrior mountains. It is a pleasant vale of lime-stone bottom, about five miles wide; and its vicinity abounds with lead-ore. In 1779, it contained about 60 or 70 families that lived in log-hovels, and formed in less or eight years several valuable plantations. Among the curiosities of this place is that called the "Swallows," which affords several of the largest streams of the valley, and after conveying them several miles under ground, return them again upon the surface. These subterraneous passages have given occasion to the name of "Sinking-Spring Valley." Of these the most remarkable is called the "Arch Springs," which run close upon the road from the town to the fort; being a deep hollow formed in the lime-stone rock, about thirty feet wide, covered with a flinty arch, and giving passage to a fine stream of water. The subterraneous river enters the mouth of a spacious cave, whose exterior aperture is sufficient to admit a hollow with her falls full spread; and in the middle of this cave, from eighteen to twenty feet wide, are timber, branches of trees, &c. which being lodged upon the roof of the passage, shew that the water rises to the top during times. The cave, extending about forty yards, widens into a large kind of room, at the bottom of which is a vault, where the water forms a whirlpool, and absorbs pieces of floating timber, which are instantly conveyed out of the cave. From the top of the Bald-eagle mountains there is a fine prospect of the Alleghany, stretching along till they seem to meet the clouds. Much stone is found here; and there are flint rocks of pit-coal.

BALDEGG, a lake of Swisserland, four miles long and one wide; nine miles S.S.W. of Bruggarten.

BALDENAU, a town of Germany, in the circle of the Lower Rhine, and bishopric of Treves: 36 miles S.S.W. of Coblenz.

BALDÉRIC, in Biography, a French historian, a native of Orleans, lived in the 12th century, and was bishop of Dole in Brittany. He afield at the council of Clermont, held on occasion of the holy war, and wrote a history of that war in four books, containing an account of the
events of that fanatical expedition from its commencement to the year 1599, when Jerusalem was taken by Godfrey of Bouillon. This work may be found in "Gea Dei per Francos a Dongar," folio, 1541. He also wrote "Poems," preferred in the fourth volume of Du Chefne's collection of French historians. Nouv. Dict. Hitor.

BALDERN, in Geography, a town of Germany, in the circle of Swabia, and county of Ottingen, one mile S.S.E. of Zobing.

BALD-HEAD, a cape of the north-west coast of America, and on the west coast of Newfoundland, between Perrouges harbour on the S.S.W. and Fort Agnus on the N.N.E. Baldhead is also at the mouth of Cape Fear river in North Carolina, and being at the south-west end of Smith's island, forms with Oak island the main entrance into the river.

Bald-head makes also the south-west part of what is called Wells bay, in the district of Maine.

BALDI, BERNARDINO, in Biogaphy, a learned Italian, was born at Urbino, in 1553. Such was his ardour in the prosecution of knowledge, that he sacrificed both his meals and his sleep to the attainment of it. Having studied mathematics under Commandino in the place of his nativity, he purveyed his studies in the university of Padua; where in his twentieth year, he was distinguished by his literary application and proficiency. Such was his acquaintance with the Greek language, that he translated the Phenomena of Aratus into Italian verses, and other Greek writers into Latin; and he polished such a talent for acquiring the knowledge of languages, that he learned twelve of them, several of which were oriental. When he left Padua, he became mathematician to Ferrante Gonzaga II. duke of Guastalla; and in 1586, he was created abbot of Guastalla, which church he governed for many years with great reputation. At Rome, where he spent part of his time, he obtained the title of apostolical prothonotary. Towards the latter part of his life, he refugied the church of Guastalla, and returning to Urbino, devoted himself entirely to his studies. He died in that city in 1617, at the age of 64 years. Balòi obtained as high a rank among the Italian poets as he polished among the scholars and mathematicians. In pastoral poetry, his "Céo," or "Orto," is thought to be excelled by few works in the language; and his blank verse is much esteemed. In mathematics and mechanics his labours were numerous. He translated into Latin the Greek work of Hero of Alexandria, "On Automata, or self-moving Machines," and into Latin, the name author's treatise, "On warlike Machines." He also wrote "Exercitations on the Mechanics of Architecture," and published two Latin works relative to Vitruvius, the one containing an explanation of all the terms used by him, and the other inquiring into the meaning of his "Seamills impares." A profound work, intituled, "Cronica de Mathematicis," being a compendium of a larger one on the lives of mathematicians, was printed in 1507. Many other monuments of his genius and industry, which obtained reputation in their time, are now configned to oblivion. Nouv. Dict. Hitor. Gen. Biog.

BALDI, DE UBALDI, a celebrated lawyer, was born at Perugia in 1349, and carefully educated by his father Francis Ubaldi, a learned physician. After having studied law at Perugia under Bartoli, he became a preceptor, and acquired high reputation in most of the universities of Italy. He was the rival of his master Bartoli, and contrived many of his opinions. The duke, John Galeazzo, was his generous patron; and he was liberally rewarded by pope Urbain VI. for pleading his cause against Clement. Having retained the full vigour of his faculties and his disting. guished reputation as an oracle of jurisprudence till the year 1400, when he had attained the age of 76, he died at Pavia, in conformance of the bite of a dog, with which he was playing. His numerous treatises of law, published in three volumes folio, manifest deep knowledge and excellent talents; but they are written too much in the barbarous style of the age. His reputation was so great, that his family, after his death assumed the name of Baldechi instead of that of Ubaldi. Nouv. Dict. Hitor.

BALDINGER, ERNSTUS GOTTFRIED, a medical writer, of whom we have no memorial, but that, in 1764, he published at Berlin, "Introductio in Notitiam Scipentorum Medicine Militarum," 8vo., a valuable work, in which, besides the titles of the books, the author has given a critical account of their contents. Haller, Bib. Med. Præd.

BALDINI, JOHN ANTHONY, Count, was born at Placentia, July 7, 1654, finished his studies at Bologna and at Rome, and then travelled into France and Poland. In 1698, he went to Spain, and continued there nine years as ambassador from the duke of Parma. On his return to Parma, he was again dispatched to German courts, and at last to England, whence he was sent to attend the congresses at Utrecht. His figure was handsome, and his manners engaging; and the greater part of his time was devoted to the study of nature philosophy, mathematics, and more especially civil and ecclesiastical history. In England, he was elected fellow of the Royal Society; and in Spain, he collected many rare gems, with a view of having them engraved; but in the progress of this work he was interrupted by his public occupations and travels. At Amsterdam, he enriched his cabinet of curiosities with many Indian and Chinese subjects; and he purchased, at a great expense, all the lexicons, atlases, and books of travels he could procure that related to the Eastern countries. The editor of the "Atlas Historique," in 5 vol., published at Amsterdam in 1719, was much indebted to Baldini's collection; and the discourse annexed to these maps was originally written in Italian by Baldini. On the 23d of February 1725, Baldini died, in consequence of a stroke of the apoplexy. Gen. Biog.

BALDINUCCI, PHILIP, was born at Florence in 1624; and distinguished himself by his knowledge of the arts of design, and his researches concerning the lives of their proficients. His great undertaking was a general history of the most eminent painters from Cimabue to his own time, comprehended in six volumes, and divided into centuries. A new edition of this whole work was published at Florence in 1731, and it has been since reprinted at Florence and at Turin, with copious notes and additions, by Sig. Ingegnere Lancenzi. Baldinucci likewise published "A Vocabulary of Design," in consequence of which he was admitted into the Academy della Cruce. His work, intitled, "The Commencement and Progress of the Art of Engraving on Copper," Florence, 1686, 4to., abound with curious information. He also published several smaller works; one of which drew upon him a furious and unjust attack from Cennini. He died in 1696, at the age of 72 years. Nouv. Dict. Hitor.

BALDINUS, GERARD, an Italian physician, who flourished about the middle of the fifteenth century, taught medicine at the university of Padua, and afterwards at Milan, where he died in the year 1600. In 1567, he published at Venice, "Problematum excerpta ex Commentaris Galeni in Hippocratem," 8vo.
BALDINUS, Bastius, another Italian physician of the
fame age, published, at Florence, "In Librum Hippocratis,
de Aquis, Aecy, et Locis, Commentaria;" "Tractatus de
Hift.

BALDIVIA, or Valdivia, in Geography, the name of
a government in the kingdom of Chili, in South America.
It was formerly subject to the viceroy of Lima, but is now
annexed to the jurisdiction of the president of Chili. 
Valdivia, or Valdivia, is also the name of a port town, situated
on the north-east face of a bay of the same name, in S. lat.
40° 5'. W. long. 80° 5'. The town was built by the Spa-
nish general Baldivis, about the year 1551; in 1559, the
people of Chili chaffed the Spaniards from this settlement,
burned the town, and put the inhabitants to the sword.
Near this place are many gold mines, and therefore the Spa-
niards have fortified it, regarding it as the key to the South
sea; and the fortifications are supported by the whites of
Peru and Chili, who are bannished hither for their crimes.
In 1643, it was taken possession of by the Dutch; but they
were compelled to abandon it, and to leave all their cannon,
confisting of 30 or 40 pieces, their baggage, and their stores,
on receiving intelligence that succours were transmitted from
Peru. Valdivia receives from the treasury of Lima an an-
nual supply of 70,000 dollars; 50,000 in specie, the value of
30,000, in cloths for the soldiers, and 10,000, in specie
which is paid to the king's folders at Santiago, in order to
purchase flour and other necessaries for the garrison at Val-
divia. These remittances are conveyed in ships which fall
from Valparaiso. The hay has a narrow entrance, and is
spacious within; it is well secured from winds by point Ga-
lera and Bonifacio, which is remarkable for its high land
juft on the north of the bay. The rivers of Baldivis and
Guyaquil are the beggar on this coast; but neither of them
can carry a ship of burden six leagues within land.

BALD-MOUNTAIN, in Geography, a noted promon-
tory in the gulf of St. Lawrence, in North America, being
a mark on the main, about 30 leagues from the nearest
north-west point of Anticosti island.

BALDNESS, Calvities, a falling of the hair, espe-
cially that of the scalp.

It differs from alopecia, are, ophioys, and tinea, as thefe
all arise from some vice in the nutritious humour; baldnes,
from the defect of it. But the defcription is not always
observed by modern physicians.

When the eyelids bled their hair, it is called a pticas.
Among the caufes of baldness, immoderate venery is re-
puted one of the chief; old age ufually brings it on of
itself. Some will have the proximate caufe of baldness to
be the dryness of the brain, and its shrinking from the cra-
nium; it having been observed, that in bald persons there
is always a vacuity or empty space between the skull and
the brain.

Buffon says, that the crown of the head, and the space
immediately above the temples, are the parts which first
become bald; but that the hair below the temples, and on
the inferior part of the back of the head, feldom falls off.
He adds, baldness is peculiar to man; women, in the most
advanced age, though their hair becomes white, are feldom
affectcd with baldness. Children and young people are not
more fubjeft to it than women. It is alleged by Arifto-
tele, that no man becomes bald before having intercourse
with women, except such as have been bald from their
birth. The ancient writers reproach the inhabitants of the
islands of the Archipelago with the epithet "bald-heads," and
affert, that these islands are all brought into the world

Calvus, bald pate, was a frequent term of reproach
among the Romans; among whom this defect was in great
discred. Hence divers arts to conceal it, as false hair, and a
galericus, contrived on purpose. The latter Romans, how-
ever, seemed to have been reconciled to baldness; for we
find among them a kind of officers or servants, called gla-
bratores, or glabarii, whose business was to take off the
hair from all parts, even from the head. In an ancient in-
scription, there is mention of one Diophantus, ti. cera-
ris. or napum. Glab. that is, ornamen. glabrius. See
Alopecia.

BALDO, Mount, in Geography, a part of the Alps,
in the Austrian territories, lying on the caft of the lake
Guida, and separating the country of Tyrol from that of
Verona, about 50 miles in circumference.

BALDOCK, Ralph de, in Biography, an English di-
vine of the fourteenth century, was educated at Oxford, ap-
pointed bishop of London in 1304, chosen in 1307 lord
chancellor of England, and in 1313 died at Stepney. His
history of the British affairs, intitled, "Historia Anglica,"
feen by Lalond, is now lost. Biog. Brit.

Ballock, in Geography, is a neat and pleasant market
town of Hertfordshire, in England. It is leated between
hills on that great Roman road which bore the name of
Felling-way, or Ickenfield-greet. This town has been con-
derably improved of late years by the erection of many re-
peetable houses; and being on a great travelling road, it
has a constant fucceflion of new company. Here are a
good market on Thursday, and five annual fairs; the for-
mer is plentifully supplied with barley; and a great quanti-
ty of malt is made in this town. Ballock dates its origin
and the foundation of its church to an earl of Pembroke,
who granted two hundreds acres of waste land, in the reign
of king Stephen, for that purpose. This was conferred on
the knights Templars, who dedicated the church to the Vir-
gin Mary, and named the town Balbece, from the name of
their former place of residence in Syria. The knights ho-
pitalers of St. John, and those of Jerusalem, also erected
buildings at the east end of the town, in the porith of
Clothhall. On the hills in the vicinity are four ancient en-
campments. Here is a manor-house founded by William
Wian, in 1621, for twelve poor widows, who are also pro-
vided with a small legacy of forty shillings annually by the
will of the same worthy founder. According to the returns
published by authority of the house of commons, this town
has 231 houses, and 1283 inhabitants; of whom 648 are
males, and 635 females.

BALDOVINI, Francesco, in Biography, an Italian
poet, was born at Florence, in 1634. His first studies were
devoted to the law, for which profession his father intended
him; but after the death of his parents, he surrendered him-
self wholly to the enchantments of poetry and music. On
visiting Rome, he obtained, through the interest of his un-
cle cardinal Flavio Chigi, the place of secretary to cardinal
Jacopo Filippo, and at the age of 40, entered into holy
orders. In 1676, he obtained the living of St. Leonardo
d'Artimino; and in 1694, Cosmo III. grand duke of Tuf-
cany, conferred on him the priorship of Orbetello, which
he changed, in 1699, for that of Santa Felicita. In the
discharge of his new functions, he gave equal satisfaction
to the court, the religious orders, and his parishioners, by
his exemplary piety, and his rigid attention to the duties of
his station, to which the amiablenes of his manners, his
knowledge of the world, and his proficiency in learning,
rendered
rendered him perfectly adequate. He lived in prosperity and health till his 82d year, and died in 1716. He excelled in that species of simple, rural, and pleasant poetry, which is neither heroic nor burlesque, and which perhaps no poetry in our language resembles more than Gay's pastorals. His "Il Lamento di Cecco da Varlungo," or "Cecco's Complaint," is a playful poem, written in the provincial dialect of Tuscan, and published first at Florence in 1614, by Parto Commes; and afterwards, in 1775, with the author's life by Domenico Manni, and curious notes by Marini. The poem was translated into English by John Hunter, esq. in 1820, London, 8vo. See the Translator's Preface.

BALDUS, or as he wrote his name, BADUS, SEBASTIAN, a native of Genoa, who flourished in the middle of the seventeenth century, was one of the earliest writers on the properties of the Peruvian bark, and the most zealous advocates of its value. It appears that he passed the latter part of his life at Rome, where he was patronized by the cardinal De Lugo, himself an admirer of that celebrated medicine, and who procured a parcel of it to be imported from Spain into Italy, in 1649. Baldus learned from Bollini, a Genoese merchant, that the tree producing the bark, of which he gives a description, grows at Quito, a Spanish province in South America; and that its power in curing intermittent fevers became first known to the Spaniards, from its being successfully administered to the countess of Cincon, the wife of the governor. He is very diffuse in his account of the qualities of the bark, and of the most efficacious mode of administering it; and gives numerous examples of the cures performed by it, not only in intermittent, but in continued fevers likewise. His works, which are all controversial, are: "Sanguis ceptator, feu de Sanguine inac-" fecundum," Genex, 1643; "Cortex Peruanae redivivus, contra Plempium," Gen. 1676, 12mo.; "Analefis Criticis Peruv., feu Chirurgii Defenfius contra Ventilationes J. Jacobi Chiuffet, et geminus V. F. Plempii," Genex, 1663, 4to.; "Neceflitas Paleobotomica in Exanthenathus," Gen. 1663, 4to. Haller. Bib. Med. Pract. Eloy. Dict. Hist.

BALDUS, BALDUS, M. D., a native of Florence, flourished about the middle of the seventeenth century. After acquiring considerable reputation in his own country, he removed to Rome, where he was soon advanced to be physician to pope Innocent the tenth, and archbishop; but died a few months after being elevated to that post. He published, in 1631, "Præcepta de Contagione pelifera," 4to.; and in 1637, "Disquisition ad textum secundum Hippocratis, de Aere, Aquis, et Locis, accedit, de Calculorum Causis; Auspe Tic-" berii Bonitate; Quæstio de majori nunc quam præterito Se-" culo, calculorum in urbe frequents," 4to. Hall. Bib. Med. Pract. Eloy. Dict. Hist.

BALDUS, in Euphrodes, a species of Papilio, with very entire brown wings; on the anterior ones above and beneath, an ocular spot, with a double pupil; on the polle-" rior ones, four ocular spots above and six beneath. Fabri-" cius. InhabitAs India. Donov. Inf. Ind.

BALDWIN I., in Biography, emperor of Conflantinople, was born in 1172, and succeeded his father as count of Flan-" ders and Hainaut. In the fourth crusade, which commenced A.D. 1198, he assumed the cross at Bruges, together with his brother Henry, and the principal knights and citizens of the rich and indolent province of Flanders, and distin-" guished himself so much in the wars which preceded the capture of Conflantinople, that after this event he was chosen emperor of the east, A.D. 1204. But the Greeks soon revolted against this foreign empire; and formed an alliance with John, or Calo-John, the revoluted chief of the Bulgarians and Walachians. Baldwin, in his attempt to recover Adrianople, from which the French and Venetians had been expelled, was drawn into an ambush by the feigned flight of the enemy, and taken prisoner, A.D. 1205. He soon after died in prison; but the time and manner of his death are not known. Some say, that after a confinement of sixteen months, he was cruelly murdered by an am-"putation of his hands and feet, and by exposing his bleeding trunk to birds of prey. The Flemings for a long time be-"lieved that he was alive; and about twenty years after his death, found a hermit in a wood of the Netherlands, who was acknowledged as the true Baldwin, the emperor of Con-"flantinople, and lawful sovereign of Flanders. But the French court detected the impostor, and he was punished with an ignominious death. Baldwin, who was esteemed for his private virtues, and for his military and princely quali-"ties, was succeeded in the empire by his brother Henry; and in his county of Flanders by his daughter Joan or Jane, who has been accused, by some grave historians, of sacrificing to her ambition the life of an unfortunate father. Gibbon's Hist. vol. xi. p. 192—262.

BALDWIN II. emperor of Conflantinople, was the son of the emperor Peter of Courtenay; and in his eleventh year, succeeded his brother Robert, A. D. 1228. On account of his youth, John of Brienne, the veteran king of Jerusalem, was appointed to be regent, and invested for his life with the title and prerogatives of emperor, on the sole condition that Baldwin should marry his second daughter, and succeed, at a mature age, to the throne of Conflantinople. The royal youth was sent to visit the western courts, and to ob-"tain some supplies of men and money, for the relief of the "linking empire. His father repeated these mendicant visits, in which he seemed to prolong his stay, and postpone his return. Of the twenty-five years of his reign, a greater number was spent abroad than at home; and no place did the emperor deem himself less free and secure than in his native country and his capital. In his first visit to England he was stopped at Dover, and checked by a severe reprisal for prevarication, without leave, to enter an independent kingdom. After some delay, he was permitted to proceed, and after a reception of cold civility, thankfully departed with a present of 700 marks. From the averseness of Rome he could only obtain the proclamation of a crusade, and a treaty of indulgences. By various humiliating and minions expeditions, he at length returned to Romania, with an army of 30,000 soldiers, and obtained some partial and temporary success. But his poverty and weakness admitted of no effec-"tual relief; and by the sale of sacred relics, such as the "crown of thorns which had been placed on the head of Christ, a portion of the true cross, the baby-linen of the son of God, the lance, the sponge, and the column of his passion, the rod of Moses, and part of the loins of John the Baptist, he could only raise a fortune of very limited extent, and of short duration. His kingdom was soon reduced to the limits of Conflantinople; and in 1261, this city was taken from him by Michael Palaeologus. Baldwin, with some of the principal families, embarked on board the Venetian galleys, and fled first for the isle of Euboea, and afterwards for Italy, where the royal fugitive was entertained by the pope and Sicilian king with a mixture of contempt and pity. Having continued thirteen years in soliciting the Catholic powers to join in his restoration, without success, he died in 1273, and his son Philip became the heir of an ideal empire; and by Catherine, the daughter of Philip, it was transferred, in consequence of her marriage, to Charles of Valois, the brother of Philip the fair, king of France. Gibbon's Hist. vol. xi. 273—287.

BALDWIN,
Baldwin, archbishop of Canterbury, was born of obscure parents at Exeter, where he received the rudiments of a classical education, and taught school; and afterwards he took orders, and was preferred to the archdeaconry of his native place. But changing his course of advancement, he assumed the monastic habit in the Cistercian order, and rose through the abbacy of his monastery to the episcopal see of Worcester, and from thence, in 1184, to the metropolitan see of Canterbury. From the monks he met with some obstruction in this last stage of his prefersments; and therefore, in order to counteract their interest and power, he formed a plan for establishing a church and monastery at Houghton near Canterbury, for the reception of secular priests; but the monks, by their interest with the pope, disconcerted the design. Under the next pope the project was resumed, and Baldwin purchased a manor at Lambeth, where, upon the spot where the archbishop's palace now stands, he began to build his college, with the materials collected at Houghton; but he did not live to complete his design. In 1189, he performed the ceremony of coronation for Richard I. at Westminster; and upon the translation of the bishop of Lincoln to the see of York, he took occasion to establish the preeminence of the archbishop of Canterbury, by forbidding any English bishop to receive consecration from any other hands than those of this metropolitan. Archbishop Baldwin took a part in the crusade for the recovery of the holy land, and when Richard I. conducted an army into Palestine, this prelate appeared in his train; and by his private contributions and pious exertions encouraged the enthusiastic adventurers to persevere. At the siege of Acre or Ptolomeis, or, as some relate, at Tyre, the bishop was feized with a violent disorder, which terminated in his death, A.D. 1191, or A.D. 1193. During his illness, he directed his executor, the bishop of Salisbury, to distribute, at his discretion, all his effects among the soldiers. He was distinguished by his humanity and generosity; but the mildness of his temper betrayed him into remissness in his pastoral offices; so that a letter was addressed to him by pope Urban III. with this superscription; "Urban, bishop, servant of the servants of God, to Baldwin, a most zealous monk, a fervent abbot, a lukewarm bishop, and an negligent archbishop." Baldwin wrote several tracts, chiefly theological, which were collected and published by father Tiffner, and which may be found in the fifth volume of the "Bibliotheca Cisterciensia." Cave, H. L. vol. ii. p. 250. Biog. Brit.

Baldwin's "Phosphorus, in Medicine," a phlegm-horsetail sublimate, formed by calcining the nitrate of lime in a low red heat. See "Phosphorus, Baldwini."
Roman catholic writers; and he has been charged with
diligence and erudition by several respectable critics;
among whom we may reckon Wharton and Nicolson.
Granger (Biol. Hist. vol. i. p. 139, 280.) allows, that the
intermediate zeal of this prophet often carried him beyond
the bounds of decency and candour in his accounts of the
papists; nevertheless, his sufferings may furnish some apolo-
gy for his acrimony, and many things which he relates,
though before delicately concealed or ingeniously glossed
over by Roman catholic writers, might probably be true.
This biographical work, with considerable allowances for the
strong bias of party zeal, may be read with advantage.
Balcus de Scip. (apud Seript. Wharton. Pref. to Anglia

Bale, in Commerce, a term denoting a quantity of mer-
chandise wrapped or packed up in cloth, and corded round
very tight, after having been well secured with hay or
seed, to keep it from breaking, or to preserve it from the
weather. Most of the merchandise, capable of this kind of
package, that is sent to ports, or intended for exportation,
ought to be in bales; and too much care cannot be taken
in packing them, to secure them from damage. To fell
goods in the bale is to fell them in the lump, or throwing a
specimen, without unpacking or taking off the cordage.
Thus it is the East India company sell their bale-goods.

Bale-Goods, in the East India Trade, the bulky goods, as
fall, petre, pepper, red-earth, tea, &c. The bale goods
fand opposed to piece goods.

Bales of Camden, at Smyrna, are called tables, on account
of their flat square figure.

A bale of cotton yarn is from three to four hundred
weight; of raw silk, from one to four hundred; of
lockram or dowlas, either three, three and a half, or four
pieces, &c.

Bale of Paper, denotes a certain number of reams packed
together in a bundle.

There are bales of more and fewer reams. Those sent from
Marailles to Constantinople usually contain twelve reams.
A bale or ballon of crown paper manufactured in some parts
of Provence, consists of fourteen reams, and is fold in the
Levant for Venice paper.

Bale of Dry Goods, denotes a little packet or paper, containing
some dozens of dices for playing with.

Bale, in Geography. See Bale.

BALEARIS INSULAE, or Balearic Islands, in Ancient
Geography, the name by which the two islands of Majorca
and Minorca, and some others in the Mediterranean sea,
were formerly distinguished. They derived their name from
that of the inhabitants, who were denominated Baleares,
as some have suppossed from baalas, to throw, because they
were excellent fencers. Bochart (Geog. Sacr. apud, Op. t. i.
col. 634.) deduces the appellation, as well as the people,
from a Phoenician origin; and he says, citing the authorities of Polybius, Strabo, and Stephanus, that the
name is formed of the two words θήλασις, θαλασσα, denot-
ing a matter of throwing, and thus he adds, the term θήλασις
θαλασσα, base ethinon, Gen. xlix. 23. signifying skillful archers.
The Greeks called these islands Gymnaxis, either as Livy
or Diodorus supposed, because in summer the inhabitants were
naked, or rather, as Heyfichius observes, because they
went to battle armed only with a fling. M. Gebelin in-
mates, that θήλασις signified among the orientals, the fan, and
hence it became a denomination for elevated objects; so that
the Baleares were persons who projected darts or throws from
flings to a very great height. Whatever be the precise ety-
omy of the name, the Baleares were famous for their
dexterity in the use of the fling; and in order to attain perfec-
tion, they accustomed themselves from their infancy to
this kind of exercise; insomuch that mothers did not put
bread into the hands of their children, but obliged them to
beat it down from a considerabie eminence with their flings.
They also united force with this address, and the best tem-
pered arms were fearfully proof against the darts or
throws it discharged. When they went to battle they carried with them
three flings of unequal length, according to the different
distances at which they might have occasion to use them
against the enemy. They were originally Phoenicians or
Carthaginians, who possessed the islands called by their name
from the extreme antiquity, that their first arrival is prior to
every thing related of them by every historian now extant,
except their peopling the island Ebusus or Ercusus, now
Yvica, about 1632 years, as Diodorus Siculus (l. c. 1 & 2)
inform us, after the foundation of Carthage. This island,
according to Vitruvius, was reckoned to belong to the Bal-
eric islands. We learn from Justin (l. xiv.), that the first
expedition which the Carthaginians made to Spain, was in
order to afflit the city of Gades (now Cadiz); and as the
Carthaginian fleet, failing from Carthage to Gades, might
easily take Ebusus and the other Balearic islands in its way,
there is great reason to believe, that Gades was relieved,
and Ebusus, with the other Balearic islands, planted or
reduced much about the same time. The Balearic lived for
a long time in the simplicity of uncultivated nature. Caves
under the rocks, or holes dug in the earth, served them for
habitations. They were almost naked, except that during
the cold of winter they covered themselves with sheep-skins.
The soil of their country was fertile, and supplied them with
the necessaries of life; but being very eager for wine, much
of them as had served in the Carthaginian armies did not
fail at their return to lay out all the money they had acquired
in this article; indeed, they were not allowed to bring mo-
ney into their country, as the use of it was prohibited in
both islands. They said, as Diodorus Siculus informs us,
that Geryon's riches had of old been fatal to him, in draw-
ing Hercules upon him as an enemy; and that, taught by
this example, they had from the remotest antiquity always
dreaded introducing among them a metal, capable of exciting
the avarice of other nations, and thus dangerous to their tranquility.
They were in general a pacific people. However, some individuals having longed themselves with
the pirates that infested the seas, Metellus, who was consul of
Rome about the year 163, B.C. 124, projected an expedition for invading their country.
In order to secure his success, he is said to have rendered their flings
useless, by placing skims on the sides of the rocks, which
deeded the blows. As soon as the Roman troops landed,
the inhabitants fled, and dispersed themselves over the coun-
try, so that it was more difficult to find than to defeat them.
Metellus, for securing his conquest, planted two colonies,
viz. Palma and Polentia, the one at the east, and the other at
the west extremity of Balearic major. He obtained a tri-
umph A. U. C. 631. B.C. 123, and assumed the surname of
Balearius. Flor. l. iii. c. 8. The largest of these islands was
called Balearia maior, now Majorca, and the least Balearia
minor, now Minorca. They were distant from one another,
according to Pliny, thirty miles; and in the latter of the
two islands, the most considerable towns were Mago and
Jarmo. These were at first cities or forts, but being erected
near the mouths of two convenient harbours, they
became considerable sea-ports, especially that of Mago, now
known as Port Mahon. The Baleares formed a part of the
provincia Tarragonensis, and were denominated "Fortuna-
te," on account of their situation and harbours.

BALEARICA.
BALEARICA. Briff. genus balericus Aldr. balericus fronce Ray, Willughby, Sloane, &c., in Ornithology, a trivial name given by thec and some ornithological writers to the crowned heron of Latham, and Ardea Pavoia Gmelin.

BALECHOU, John Joseph, in Biography, an celebrated French engraver, flourished about the year 1570, and died not many years since at Avignon. He was perfect master of the graver, with which he entirely worked; and distinguished by the clearness of his strokes, and the depth of colour which he produced; but for want of drawing well, his prints fall in point of freedom, correctness, and harmony. His two large plates from Venet, one representing a 'Storm,' the other a 'Calm,' are well known, and universally admired. Strutt.

BALEME Port, in Geography, is a port of North America, two leagues distant from Louvain, on the coast of the island of Cape Breton. The rocks, which are covered by a high sea, render it difficult of access.

BALEN, Hendrick Van, in Biography, a painter of history and portrait, was born at Antwerp, in 1560; and after having been a disciple of Adam Van Oort, he pursued his studies at Rome. By copying the antiques, and attending to the works of eminent modern artists, his improvement was such, that, in his return to his own country, he obtained the esteem of the ablest judges. He was distinguished by a good manner of designing, and his works are admitted into the cabinets of the curios, among those of the principal painters. He particularly excelled in the shades, and gave to his figures so much truth, roundness, and correctness of outline, that few of his contemporaries could enter into competition with him. Several of his fine portraits are at the Hague; and particularly one adorned with the figures of wisdom and justice, which is very highly commended. His designs of the deluge, of Moses bearing the rock, and the drowning of Pharaoh, are grand and noble compositions. His "Judgment of Paris" is also acknowledged a masterly performance; in which the figure of Venus is so elegantly designed, so full of life, and so round, that it seems to stand forth from the surface. He died in 1632.

Pilkington.

BALEN, Jacob Van, a painter of history, landscapes, and boys, was born at Antwerp, in 1611, and derived from his father Hendrick Van Balen his knowledge of the art, and his fine taste of drawing; but for want of drawing well, he traveled to Rome, and other cities of Italy. His particular merit was exhibited in his figures of boys, epochs, and nymphs bathing or hunting; and he gained wealth and fame by his landscapes and histories. His pictures were well handled, his trees touched with spirit, and his herbage and verdure appeared natural and lively. The caricatures of his figures were clear and fresh, his colouring in general was transparent, and the art of his heads were in the manner of Albano. Pilkington.

BALENDERS, in Geography, a town of Germany, in the circle of the Lower Rhine, and territory of Mentz, two miles north-west of Krefthen.

BALENGER, Balescario, in Middle Age Writers, a kind of vellum of war, but what in particular seems not well known. Blunt says, that by the flat. 28 Hen. VI. cap. 5, balenger seems to have been a kind of barge.

BALES, Peter, in Biography, an extraordinary master of penmanship and fine writing, was born in 1547, and deserves to be recorded on account of the skill which he acquired in the exercise of his art. Anthony Wood mentions him as "a most dexterous perfon in his profession," and as having spent several years in sciences among the Oxfordians, particularly as it seems in Gloucester hall; but that study which he used for a diversion only, proved at length an employment of profit." Holinshed, in his Chronicle, A.D. 1575, records his skill in micrography or miniature writing; and Mr. Evelyn (Numismata, fol. 1697, p. 262.) says of him, that in 1557 he wrote the lord's prayer, creed, dialogue, with two short Latin prayers, his own name, motto, date of the month, year of our Lord, and of the queen's reign, to whom he presented it at Hampton Court, all within the circle of a single penny, encahed in a ring and border of gold, and covered with crystal; so nicely wrote as to be plainly legible, to the admiration of her majesty, her privy-counsel, and several ambassadors, who then saw it." He possessed also an extraordinary skill in imitating the writing of others; and he seems to have been employed in this and similar ways for the service of the state, with a view to the complete discovery and conviction of traitors, between the years 1585 and 1589. At this time he had reason to expect some place or preference at court; but being disappointed in his expectations by the death of secretary Wallingham, he pursued the business of a writing-maister in the Old Bailey; and in 1590, he published his "Writing Schoolmaster, in three Parts," containing the art of brachygraphy, or short writing; the order of orthography, or true writing; and the key of caligraphy, or fair writing. In 1595, he was engaged in a trial of skill with another performer in the same way, for a golden pen of 25l. value, which he gained; and in another more general competition, he obtained the arms of caligraphy, which are the, a pen, a. By various exercises of his pen, he recommended himself to several persons of knowledge and distinction; and Anthony Wood says, that he was engaged in the transcriptions of the Earl of Essex, in 1620: but the real fact was, that Bales was innocently employed in serving the treacherous purpofes of one of the earl's mercenary dependants. Towards the close of his life, he seems to have been reduced to a defult and distressed condition, either by his own extravagance, or by imprudence in confidence in others; and to have died about the year 1670. Blong, Brit.

BALESCOU de Tharares, or Valdes de Tarenta, a Portuguese. It appears from his own testimony, that he began writing in the year 1418, after thirty-six years experience. His first publication "De Philonimo," was printed at Venice, 1418; then at Lyons, in folio, in 1511; and his work, "De Morbis," was published by Guido de Liguacq, at Lyons, in 1560, in 4to, and afterwards at Frankfort 1590. A short tract, "Tractatus Carolior," is printed with the Philonimo. He propsoes expirating cancers by an application, in which arsenic is an ingredient. This drug, we know, formed the basis of a preparation of late introduced, for the same purpofe, by Plincket. Our author, however, admiths pitfalls, that erisnic is not used without danger. He saw a person who died suddenly in the night, whose head had been anointed with an arsenical preparation, for the cure of these capsins. It appears, from his works, that he was well acquainted with the doctrine of Galen, and of the Arabic writers. Haller. Bib. Chirurg.

BALESIUM, in Ancient Geography, a town of Italy, in Magna Graecia, in the country called Metapoa. Livy and Mela.

BALESOS, an island of the Egean Sea, between Thrace and the island of Crete. Anton. Ita.

BALESSAN, in Deymus. See Balsam.

BALESTRA, Antonio, in Biography, an historical painter, was born at Verona, in 1660: at the age of twenty-one, entered himself in the school of Antonio Balucci, at Venice, and afterwards visited Bologna and Rome, at which latter place he became the disciple of Carlo Maratti. Having
ing made great proficiency in designing after the antiques, after Raphael, Correggio, Annibale Carracci, and other admired painters, he obtained the prize of merit in the academy of St. Luke, in the year 1694, when he was only twenty-eight years of age. From that time his reputation was established, and his paintings were admired in every part of Europe. His style is sweet and agreeable, not unlike that of Maratti; and men of judgment observed, with delight and approbation, a certain mixture in his works of the several manners of Raphael, Correggio, and Carracci. At Venice there are two capital pieces of this matter; one representing the nativity of our Saviour, in the church of Santa Maria Mater Domini; and another, a dead Christ in the arms of the Virgin, in a chapel belonging to the church of St. Gemmiano. We have some etchings by him, in a bold, masterly style, but very flight. According to Pickering, he died in 1723; but Strutt says, he died in 1740, at the age of 74.

Balestrina, in Geography, a town of Italy, in the state of Genoa, a chief of the empire, nine miles north of Albenga.

Baiet de la Royne, in Music. This dance, more ancient than any mentioned in the long article on the subject, in the Encyc. Meth., where it has not been honoured with notice, merits a place, as a curiosity, if not for its superior plan and execution.

Henry III. of France having, in 1581, married his favourite minion, the due de Joyeuse, to mademoiselle de Vaudemont, filter to the queen Louise de Lorraine, also found his kingdom in balls, masquerades, tilt, tournaments, and every species of expensive festivity which could be devised on the occasion.

The queen, likewise, in honour of her father's nuptials, gave an entertainment at the Louvre, in which a ballet was exhibited, called "Ceres et sa nymphes," which was then a new kind of spectacle in France, with a grande mufique, composed by the celebrated Claude le Jeune. The "Entrées de Ballet," in this ietz, were invented by Bailletar de Beaufioy, the famous Piedmontese performer on the violin, who having published an account of his device in a book which is now become extremely scarce, we shall present our readers with its title, and a sketch of its contents.

"Ballet comique de la Royne, faite aux noces de monsieur le due de Joyeuse et mademoiselle de Vaudemont fa feur. Par Balfar de Beaujoyeulx, valet de chambre du Roy, et de la Royne fa mere." A Paris, 1582, 4to. The types and paper equal in beauty those of Elzevir in the next century; and the musical characters, though cut in wood, are much more clear and neat than any we ever saw of the kind. But as to the music itself, it is more barbarous, in point of melody, than any we have ever seen on paper. The counterpart. Indeed, is not incorrect: nor can the French be faulted accused of ever being deficient in the mechanical rules of composition. Since they were first established; but for fancy, air, and rhythm, there is not a passage in this whole performance, except in a few of the dances, by which we are reminded of their existence. But it seems as if dancing could not subsist without a marked measure; indeed, when poetry is sung without measure, it becomes worse than prose. In the operas of Lulli and Rameau, the music of the dances was always much more pleasing to foreigners than that which was sung, from its being necessarily more marked and accented: that is, in what was danced some determined measure and movement was always perceptible. But in the vocal part of de Beaufioy's balia, there is nothing that resembles an air, or that seems to imply a felection of notes, or to suggest a reason for one sound being higher or lower, more quick or more slow, than another.

But it should be remembered, that the music of this old French ballet was not composed by Bailtazari, the Italian, who only acted as ballet master on the occasion, but by Messrs. de Beaulieu and Salmon, of the king's band, whom his majesty had ordered to assist him in composing and preparing all that was most perfect in music for this festival; "and M. Beaulieu," says Bailtazari, "whom all professors regard as an excellent musician, has, on this occasion, even surpassed himself, assisted by Maître Salmon, whom M. Beaulieu and others highly esteem in his art."

We have dwelt the longer on this performance, as it is the only French theatrical music extant of the time. And in comparing it with that of Lulli, it appears that he did not disdain to comply with the national taste, which had been long established, with respect to measure and melody; he certainly added much to both, but confounded to the genre.

As it will be no kindness to curious readers to refer them to so scarce a book for examples of this music, we may venture to mention the Gen. Hist. of Mus. vol. iii. where copies extrals from it are inserted.

Bally, Walter, in Biography, born in the county of Dorset, in the year 1529, received his education at Winchester, and went thence to New college, Oxford. Applying himself to the study of medicine, in the year 1558 he was licensed to practise. About the same time he was made a prebendary in the cathedral church of Wells, which office he resigned the following year. He was then appointed Queen's professor of physic at Oxford. In the year 1563, he was created doctor in medicine (Wood's Oxf. vol. i. p. 92.), and soon after, Physician to Queen Elizabeth. For the remainder of his life, which was extended to the age of 63 years, he enjoyed a considerable share of reputation and practice. Of this physician we have the following works, three of which were published in his lifetime, "A Discourse of three kinds of pepper in common use," 1588, 8vo. "A brief treatise on the preservation of the eye-light," in which he attributes great virtues to the herb eye-bright. This was re-published in 1616, and in 1622 was added to Bailer's treatise of 113 diseases of the eyes and eyelids, but without the name of the author. "Directiones for health, natural and artificial, with medicines for all diseases of the eyes," 1626, 4to. "A brief discourse of certain medicinal waters in the county of Warwick, near Newnham," 1587. In the library of Robert earl of Aylebury was a MS. of this author, entitled "Explicatio Galeni de potu convalecentium, et feum, et præcipitata de nostra aetate et hirie paratior." Biograph. Mem. of Med. J. Aikin.

Balfusch, in Geography, a town of Persia, the capital of the province of Malanderan, sittuate at the southern extremity of the Caspian sea. Hither the Russians and Armenians convey their merchandise, though the traffic is much less considerable than it was, on account of the interventions of the khan of Malanderan. The chief productions are silk, rice, and cotton, of which articles there is a large exportation. Merchants from Kaik, Ipahan, Schiras, and Korasan resort to Balfusch, and bring for sale the Persian and Indian commodities. N. lat. 33° 40'. E. long. 50° 50'.

Balga, a town of Prussia, in the province of Nantagnet, 25 miles south-west of Königsberg.

Balgu, John, in Biography, an English divine, was born at Sheffield in Yorkshire, in the year 1686. Having received instruction first from his father, who was master of a free grammar school in that place, and after his death from his successor Mr. Dabuis, author of an elevated commentary on the revelations, he was admitted in 1702, of St. John's.
BAL

John's college, Cambridge. From the frivolous occupation of reading romances, in which he left two years of his academic education, a circumstance which he mentions with regret, he was diverted by reading Livy, and afterwards devoted himself with pleasure to serious studies. In 1711, he took orders, and diligently discharged the duties of his profession in the living of Lamlady and Tanfield in Durham, composing for several years a new discourse for the pulpivert week. Balguy was an early advocate for religious liberty in the Bangorian controversy; and in 1713, wrote a vindication of bishop Hoadly, intituled "An Examination of certain doctrines lately taught and defended by the Rev. Mr. Stukeby," and in the following year, "A Letter to the Rev. Dr. Sherlock," both under the fictitious name of Silvius. In 1720, he published a third tract, intitled "Silvius's defence of a dialogue between a Papist and a Protestant." In a controversy concerning the nature and foundation of virtue, occasioned about this time by lord Shaftesbury, who, in his "Characteristics" referred it to an inductive sentiment; and by Hutchison, who, in his "Inquiry into the Original of our Ideas of Beauty and Virtue," maintains the same notion; Mr. Balguy took a principal part. In 1726, he wrote, in reply to Shaftesbury, "A Letter to a Deist, concerning the beauty and excellence of moral virtue, and the support and improvement which it receives from the Christian revelation;" and in 1728, he published a tract, intitled, "The foundation of moral goodnes, or a farther inquiry into the original of these ideas of virtue," which in the next year was followed by a second part, illustrating the principles and reasonings of the former, and replying to certain remarks communicated by lord Darcy to the author. (See Virtue.) In 1730, he published a treatise, under the title of "Divine Retulitude; or a brief Inquiry concerning the moral perfections of the Deity, particularly in respect of Creation and Providence. (See Attributes.) This treatise was followed by a "Second Letter to a Deist," occasioned by Tindal's "Christianity as old as the Creation;" and by another tract, intitled, "The Law of Truth, or the Obligations of Reason essential to all Religion." In 1741, Mr. Balguy published an "Essay on Redemption," explaining the doctrine of atonement in a manner similar to that afterwards adopted by Dr. Taylor of Norwich. (See Atonement.) Of this treatise, bishop Hoadly expressed his opinion, that the author had been more successful in refuting Christianity from foreign absurdities, long considered as essential to it, than in subfittting others in their stead. The only additional publication of Mr. Balguy was a volume of Sermons, to which has been since added a posthumous volume; the subjects of both are chiefly practical, and the discourses have been justly admired as models of the plain and simple style of preaching. Towards the close of his life, his health declined, and he found it necessary to withdraw from company, except such as he selected at Harrowgate, which he frequented every season, and where he died in 1748, in the sixty-third year of his age. The only church preferments which Mr. Balguy enjoyed were the vicarage of North-Allerton in Yorkshire, worth about 27l. a year; and a prebend in the church of Salisbury, to which he was collated by bishop Hoadly in 1728. Mr. Balguy may justly be reckoned among the divines and writers who rank with Clarke and Hoadly, and who, associated with these illustrious men in maintaining the cause of rational religion and Christian liberty. Candid and liberal in his own sentiments and disposition, he cultivated friendship with worthy persons of all denominations; and his writings very much contributed to promote liberal discussion and rational inquiry. Biog. Brit.

BALHARY, in Geography, a town of Hindoostan, in the Mysore country, seventy miles north-east of Chittorgurh, and twenty miles north-east of Raidroor. N. lat. 15° 6'. E. long. 76° 54'.

BALLY, or BALLY, one of the isles of Sunda, situate in the Java sea, on the eft side of the Strait of Bally, which separates it from Java; 23 leagues long, and 15 wide, fertile and populous. It seems only remarkable for furnishing flaves, cotton-yarn, and pickled-pork. S. lat. 8° 30'. E. long. 117° 10'.

BALLY, or BALLY, Strait, lies on the west side of the island of this name, in the Indian ocean. Its north entrance is in S. lat. 7° 51', and the south entrance in S. lat. 8° 39', E. long. 112° 25'. It is sometimes called the Balamban channel. Through this strait the European East India merchant ships occasionally pass in their return from China. It is sometimes called Jawa strait.

BALLY, a province which once belonged to Abyssinia, and the first taken by the Galla. It lies to the north-east of Narea, and to the west of the kingdom of Adel, which separates it from the Sea, about N. lat. 10°, and E. long. 41°.

BALICASAE, balicafe of the Philippines, in Ornithology. Under this name, Bulfinch describes the corvus balicasae, Gmel. in his Nat. Hist. Birds; in the Planch. Enl. it is called chonessae des Philippines.

BALICASSUS, a species of Corvs, of a greenish black colour, with a forked tail. Gmelin. Corvs splendide nigro-violaceus. Briff. Av. The back, legs, and claws, are black.

BALIKESRI, in Geography, a town of European Turkey, in the province of Natolia, fifty-two miles north-east of Pergamo. N. lat. 39° 45'. E. long. 27° 50'.

BALINCAILACH, a cape on the west coast of Banbucula, one of the western islands of Scotland.

BALINE Head and Cove, lie between cape Broyle and the bay of Bulls, on the coast of Newfoundland. The cove is a small place behind a rock, called the Whale's back, and a stage for fishing, with two or three boats.

BALIOL, or BALIOL, JOHN, in Biography, king of Scotland, was defended from an illustrious family, which possessed large estates in Scotland and France, as well as England. He is supposed to have been born about the year 1260, or at some time earlier period; and was a competitor with Robert Bruce for the crown of Scotland; the right of succession to which belonged to the descendants of David earl of Huntingdon, third son of king David I. Bruce was the son of Isabel, the second daughter of earl David; and Baliol, the son of John Baliol, who founded Baliol college in Oxford, was the grandson of Margaret, the eldest daughter of earl David. According to the rules of succession which are now established, the right of Baliol was preferable; and notwithstanding Bruce's plea of being nearer in blood to earl David, Baliol's claim, as the representative of his brother and grandmother, would be deemed incontestible. But in that age, the order of succession was not ascertained with the same precision; and though the prejudices of the people, and perhaps the laws of the kingdom, favoured Bruce, each of the rivals was supported by a powerful faction. In order to avoid the miseries of a civil war, to which it was feared recourse would be had for deciding a dispute which the laws could not settle, king Edward of England was chosen umpire, and both parties agreed to acquiesce in his decree. Under pretence of examining the question with due solemnity, this prince summoned all the Scottish barons to Norham, May 10th, 1291; and having gained home, and intimidated others, he prevailed on all who were present, not excepting
excepting Bruce and Baliol, the competitors, to acknowledge Scotland as a fief of the English crown, and to swear fealty to him as their sovereign or liege lord. He also demanded possession of the kingdom, that he might be able to deliver it to him whose right should be preferable. This strange demand obtained assent; and Edward finding Baliol the most obsequious, and the least formidable of the two rivals, soon after gave judgment in his favour. Baliol once more professed himself the vassal of England, A.D. 1292, and submitted to every condition which the sovereign whom he had now acknowledged was pleased to prescribe. Edward having thus, as he conceived, established his dominion, began too soon to assume the mantle; but his new vassals, fierce and independent, bore with impatience a yoke to which they were not accustomed. The passive spirit even of Baliol began to mutiny, upon which Edward forced him to resign the crown, and openly attempted to feit it as fallen to himself by the rebellion of his vassals. At this critical period, Sir William Wallace, to whom his countrymen have ascribed so many fabulous acts of prowess, ventured to take up arms in defence of the kingdom, and by his boldness revived the spirit of the nation. At last Robert Bruce, the grandson of Baliol's competitor, appeared to assert his own rights, and to vindicate the honour of his country. The nobles, ashamed of their former baseness, and enraged at the many indignities offered to the nation, crowded to his standard. In order to crush them at once, the English monarch entered Scotland, at the head of a mighty army; many battles were fought, but the Scots, though often vanquished, were not baffled. The ardent zeal with which the nobles contended for the independence of the kingdom, the prudent valour of Bruce, and above all, a national enthusiasm inspired by such a cause, baffled the repeated efforts of Edward, and counterbalanced all the advantages which he derived from the number and wealth of his subjects. And though the war continued, with little intermission, upwards of 70 years, Bruce and his poverty kept possession of the throne of Scotland, and ruled with an authority not inferior to that of its former monarchs. During the contest in favour of Bruce, John Baliol lived quietly as a private man on his own estates, which were very considerable, in France, without interfering in the affairs of Scotland. Some writers say, that he lived till he was blind, which, if true, must have been the effect of some disease, since it is certain that he died A.D. 1314, when he could not, established his dominion, in his Annals of Scotland, "the short and disfated reign of John Baliol; an ill-fated prince, cursed for doing homage to Edward, never applauded for asserting the national independence. Yet, in his original offence, he had the example of Bruce; at his revolt, he saw the royal family combating under the banners of England. His attempt to shackle off a foreign yoke, speaks him of a high spirit, impatient of injuries. He erred in entrenching beyond his strength; in the caufe of liberty, it was a meritorious error. He confided in the valour and unanimity of his subjects, and in the affiduity of France. The efforts of his subjects were laudable and disinterested; and France beheld his ruin with the indifference of an unocenmerced spectator." Robertson's Hist. of Scotland, vol. I. p. 10, &c. Diog. Brit.

BALIS, a town of Africa, in Libya, and in the vicinity of Cyrene, which had its name from a temple dedicated to Baal. 

Balis, in Geography, a town of Asiatic Turkey, in Syria, on the frontiers of Diarbekir, on the west bank of the Euphrates, twenty leagues east of Aleppo. 

BALISBGIA, in Ancient Geography, a town of Asia, situated in the mountains north of the river Arvandis, placed by Ptolemey in Armenia Major. 

BALISSUS, a stream in the deserts which annually separated Assyria from Arabia, near the place where Cyrius was defeated by the Parthians. 

BALISTA, in Artillery. See BALLista. 

Balista, in Ancient Geography, a mountain of Italy, in Liguria. Liby. 

Balistes, in Ichthyology, the name of a genus of branchiostegous fishes, in the Lannanum system. The character of the genus is, to have the head compressed, continued close to the body; and sometimes a spine between the eyes; mouth narrow; teeth in each jaw eight in number, of which the two anterior ones are longest, and three interior ones against the intervals between those on the side; aperture of the gills narrow, above the pectoral fins; no operculum; rays of the membrane two; body compressed, and carinated on each side; scales joined together, coraceous, and rough, with minute prickles. Nearly all the fishes of this genus are remarkable for their splendid colours. The species mentioned by Linnaeus and Gmelin are the following: monoceros, scriptus, hilipidus, tomentofus, papiliforus, verrucosus, bicnematus, aculeatus, vetula, maculatus, riegenus, finenifs, affalii, capricornus, furcatus, punctatus, Kleini, curafavicus, and Americanus; which see. 

Lacepede has described twenty-four species of balistes, in his work on fishes, and which he divides into four families; le baliste mamelone, le baliste pralin, le baliste verdace, le baliste Munago-Park (Park); le baliste metalique, &c. are new or interesting species described by Lacepede, Boie, &c. as will be noticed hereafter. 

BALITO (Guizado Balito), in Ornithology, the name of emberiza tridactyla, or three-toed grozbeck, in Buffon's Hist. Birds. 

BALIVIS, a name given by the people of the Philippine islands to a kind of duck that is smaller than the common wild duck of this country. The species is unknown. 

BALIMO anormosus, in Linn. a wrat to remove a ballast from his office, for want of sufficient land in the bailiwick. 

BALIZE, in Geography, a fort at the mouth of the Misiphi river. 

BALK, in Agriculture, a ridge or bank between two furrows, or pieces of arable land. 

Balks, among Builders, denote large pieces of timber brought from abroad in floats; or a sort of beams imported from five to twelve inches square. The greater balks are accounted timber, if above eight inches square. 

Balk, or Bawak, is also used in some parts of England for thesummer-beam of a building, for the poles or rafters laid over outhouses or barns; and among bricklayers, for the pieces of timber that are used in making field oaks. 

Balk, in Geography, a province of Great Bucharia, in Independent Tartary, corresponding to the ancient Bactria or Bactriana. It lies to the north of the province of Samarcand, and east of Proper Bucharia, and has been estimated at 360 miles in length, and 250 in breadth. Botinck observes, that though this province is the smallest of the three into which Great Bucharia was formerly divided, the other two being Samarcand and Bucharia Proper; yet, being very fertile
ferile and well cultivated, the prince draws from it a considerable revenue. The country abounds with silk, which furnished the inhabitants with a valuable article of manufacture. The Ubecks, subject to the khan of Balk, are the most civilized of all the Tartars inhabiting Great Bucharia, which circumstance is attributed to their commerce with the Persians. This country has been divided into several provinces, of which the most remarkable are Khotian, Tokareftan, and Badakhshan. Its chief cities are Balk, Fariab, Talkan, Badakhshan, and Andarab. Mod. Un. Hist. vol. iv. p. 358.

Balk, a distinguished city of the above-mentioned province, leant towards the borders of Persia, on the river Dewaz, which flows into the Amu from the mountains of Gaur or Paropamisus. It was probably the ancient Bac-teria, which see. The historians of Persia say that it was founded by Kainnath, the first king of Persia, and that he gave it this name because he had found his brother, whom he had lost, on this spot: bakhidin, or bafidin, signifying, in their language, to receive and embrace a friend. The first kings of Persia, who inhabited the province of Aberdian in Media, considered this city of Bactrians as the frontier of their country. After severe contests between the oriental Turks and Persians, the kings of Persia of the second dynasty made this city the capital of their empire, as it served to prevent the people of Turquetian or Tokareftan from obtaining the passage of the river Oxus or Gihon. The kings of the succeeding dynasties established other principal cities, and Balk was merely the capital of Khordan, which preeminence belonged to it when it was taken by Ahmaz, the son of Alkaius, the Arabian commander, under the caliphate of Othman. Under the Abasid caliphs, and succeeding sultans, Balk was a city of peculiar distinction; it was called Cukat al E-zen, or the capital of Amu Khorasan, and extended its jurisdiction over the countries of Badakhshan, Khotian, and Tokareftan. It was taken by the Moguls or Tartars, under Jeoghis Khan, in the year of the Hegira 618, A. D. 1221, and by his orders its inhabitants were removed out of the walls of the city, and cruelly massacred. In the year of the Hegira 574, A. D. 1369, Tamerlane compelled sultan Hufiun, the last of the race of Jeoghis Khan, to surrender the city; and his successors retained possession of it till they were expelled by the Ubecks in the fifteenth century. Between the Ubeck Tartars and the Persians it has been the occasion of continual wars. The principal castle of this city is constructed upon the model of that at Mecca. Herbel, Bibl. Orient. p. 167.

In the beginning of the 16th century, Balk was the most considerable of all the towns possessed by the Mahometan Tartars, as Bentink informs us, being large, handsome, and well peopled. Most of its buildings are of brick or stone; and its fortifications confit of earthen bulwarks, lined on the outside with a strong wall. The khan's castle is a magnificent structure, after the eastern fashion, built wholly of marble, dug out of the neighbouring mountains. In 1739, Balk was obliged to submit to the arms of Nadir Shah, or Kuli Khan; but has since recovered its independency. As foreigners have free liberty to trade in this city, it is the chief seat of the commerce between Great Bucharia and Hindostan. N. lat. 36° 21'. E. long. 65° 31'. BALKAN, a bay on the eastern coast of the Caliasa sea, in which are islands inhabited chiefly by pirates of the race of Turcoman Tartars. These islands produce rice and cotton, and one of them, called Naphthonia, abounds in naphthen. The traffic, says Mr. Coke (Trav. in Ruflia, vol. iii. p. 332.) might be increased to the advantage of Ruflia; as it would be far more commodious to trade with the Tartars of Khiva and Bucharia from these parts than from Orenburg, through the country of the warlike and independent Kirghises.

BALKAN, a mountain of European Turkey, which divides Romania from Bulgaria.

BALKEE, a town of Hindostan, in the country of Dowalbad, 15 miles W.N.W. of Buder.

BALKERS, in the Flbury, person place on rocks and eminences at sea, to spay the hering-droves, and give notice to the fishermen by waving bougnes, what way they go, and where they may be found. 1 Stat. Jac. i. cap. 27.

BALL, John, in Biography, an English divine, was born at Collingdon, near Woodstock, in Oxbridge. Although educated at Oxford, he attached himself to the cause of the Puritans. Ordained by an Irish bishop without ordination, he served a curacy of 20l. a year at Whitmore in Staffordshire, and with this, together with the produce of a small school, he lived contentedly. In this obscurc and lowly condition, he distinguished himself by his writings. His chief work was "A short Treatise concerning all the principal grounds of the Christian religion," and so popular was this treatise that it passed through fourteen editions before the year 1632, and was translated into the Turkish language. He also wrote "A Treatise on Faith," 4to. 1641; "A Friendly Trial of the Grounds of Separation," 4to. 1649; and several devotional pieces. Although he disliked ceremonies, he wrote against those who thought them a sufficient ground of separation. He died in 1649, with the character of a laborious preacher, and an ingenious writer.

Ball, in a general sense, a round body, found naturally, or formed by art, of this figure.

Ball, in Antiquity, gives the denomination to a species of game or sport frequent among the ancients. The Romans had four kinds of pile, or balls: the first called trigon, or trigonellis, because the three gamesters at it were placed in a triangle; these alternately caught and tossed the ball, and towho first let it fall to the ground, was the lober. The second called foliis, or follicosus, was made of leather, blown up like our foot-balls; the largest sort of these were struck with the arm, the smaller with the fist; the former seem to have been distinguished by the appellation fascia, as being made use of in country villages: the fourth was the largus, a kind of small ball, so called, because the gamesters endeavored to match it from each other.

Galen has an entire treatise on the exercise of the slower ball.

Balls, in Architecture, are represented at C, in the figure of the balefe (see Ballyfe); and are used for supporting Attic pudecles.

Balls, in Brewing. They are either brown or pale, and used to mix, feed, preserve, and colour malt-drinks, wines, and cyders. See the composition of them described under Brewing.

Balls, Martial, in Conspicary, a preparation of iron now entirely diffused in this form, but retained in the Materu Medica as a powder. It is the ferrum tartarismatum, tartari of iron; or this metal united with, and partly dissolved by, cream of tartar.

To make martial balls, take one part of filings of iron, and two parts of powdered cream of tartar; mix them well together, and put them into an earthen or iron vessel with boile water; stir the mixture from time to time, till it becomes almost dry; add more water, and stir it as before, till it acquires, when nearly dry, somewhat of the consistence and
and tenacity of softened rosin; then it is rolled into the form of a ball, generally kept tied up in a rag, and when it is used, infused into water, till it gives some colour to that liquid. Mac. Chem. Dict. Eng. Ed.

Balls, Mercury, an amalgam of mercury and tin sufficiently solid to be moulded, and to preserve a solid form.

To make mercurial balls, add mercury to its weight of melted tin, and pour the fluid mass into a round and hollow mould.

These balls have been employed to purify water in which they are boiled, an opinion which is perhaps in some degree well-founded, since mercury even in imperceptible quantity is known to destroy animalcula. However, the boiling alone would probably produce nearly the same effect, and the mercurial balls are no longer in use. The tin is not an useless addition, since besides giving the mass a proper confluence, it assists melt materially in the oxidation, and therefore the solubility, of the mercury.

Balls, in Electricity, are two pieces of cork, or pitch of elder, nicely turned in a lathe, to the size of a small pea, and suspended by fine linen threads; invented by Mr. Canton as electrometers, and of excellent use to discover small degrees of electricity, to observe the changes of it from positive to negative, and vice versa; and to estimate the force of a shock before the discharge, so that the operator shall always be able to tell very nearly before the discharge, by knowing how high he has charged his jar, what the expiration will be.

Balls, Cryptalline, in Natural History. There are two sorts of tubular bodies mentioned in authors by this name, and differently into the echinated and concave. The thirtieth are roundish nodules of strong matter, covered with points of crytal; and the other, flints and other stones, having cavities in their middles, which are lined, or crutched over with these crytals.

Balls, Vegetable, a very particular kind of plant of a deep green colour, of an irregularly spherical shape, hollow within, and of different sizes, from an inch and a half to three inches in diameter. It probably belongs to the Converva genus, in the class of mosses; though Mr. Ray has ranged a similar plant under the genus of Alcyonium. (See Coral.) Phil. Trans. vol. xvii. art. 83. an 1752.

Balls, Puff. See Lycopodner.

Balls, Hero's, Pile Heronis, in Hydraulics, is a kind of artificial fountain, wherein the water is made to spout from a hollow ball or globe.

It takes the denomination from the inventor, Hero of Alexandria, who has left the description of it in his Spiri-tualia. See Fountain.

Balls of Fire in the air, in Meteorology, are meteors sometimes seen falling over countries, and computed by philosophers to be at a very considerable height in the atmosphere. They sometimes burn at that height; and though the air must exceed rare there, yet the explosion is heard at that distance, and for seventy miles round on the surface of the earth, &c. Does not this look as if a rare atmosphere, almost a vacuum, was no bad conductor of sound? Dr. Franklin's Works, p. 435.

Among the phenomena of the atmosphere, the large meteors called fire-balls, and bolides, have in modern times excited particular attention. Mr. C. F. Fulda has collected a variety of observations respecting these phenomena, in a paper read to the Physical Society of Göttingen, Dec. 7, 1796, and published in professor Gmelin's "Göttingisches Journal der Naturwissenschaften," vol. i. part 2. Thefe meteors, he observes, appear in every climate in southern and northern latitude, as well as under the equator. They are also seen at every season of the year, and at every period of the day, for the most part when the sky is serene, some of them proceeding from light clouds, which has given occasion for supposing that they originated at a greater height than thefse clouds; and they have been observed to move with different degrees of rapidity, some proceeding at about 1530 feet in a second or even with a slower motion, and others moving at the rate of thirty English miles in the same time, or with a velocity greater than the earth in its orbit. They proceed from, as well as towards, all points of the compass; however, most of them have appeared in the northern or southern parts of the horizon; and yet no general conclusion, in respect of their connection with the northern or southern lights, can be deduced from this circumstance, though some observations made in Sweden seem to favour such an hypothesis. They do not always move according to the direction of the winds nor is their velocity proportioned to that of the wind. When, indeed, they have appeared, it has generally been calm; but some of them have been succeeded by even a violent wind. They almost all descend towards the earth, and from a rarer to a denser atmosphere, as may be inferred from their soon becoming considerably enlarged.

Some, however, have proceeded in a horizontal direction over the surface of the earth, but none of them appear to move upwards. Their form is sometimes perfectly globular, and sometimes more spindle-shaped, so that their length has occupied seven or eight degrees of the heavens. When they move with a great velocity, they have been followed by a long tail, which has been ascribed to the continuance of the impression made on the eye. Others, that have moved slowly, have as if the tail, or part of it, belonged to the body itself; and it should seem that the longer train, which marks their course, ought often to be accounted for by traces left behind them rather than by mere impression. Their apparent magnitude has been very different; but frequently larger than that of the moon. Few of them have had an apparent motion round their axes. Most of them diffused a very lively dazzling light; but the smaller number have exhibited a faint light; their colour and splendor have been very different and variable, sometimes red, sometimes blue, sometimes violet, sometimes in part yellow or dazzling white, and sometimes exhibiting the prismatic colours. Some have been seen to burn with a bright flame, and others as if in a state of ignition. Their real diameter, ascertained by actual measurement or by conjecture, has been always very considerable. The diameter of that concerning which Mr. John Pringle made calculations from various observations which he collected (Phil. Trans. vol. li. pt. 1. p. 218.), and that of the meteor seen by Mr. Rittenhouse at Philadelphia, in October 1779 (Amer. Trans. vol. ii. p. 175.), were at most about half a German mile. These meteors seem to originate at a very different, but most of them at a very considerable, height above the surface of the earth. All of them, whose mean or greatest height has been the subject of calculation, were elevated above the highest clouds, as clouds are scarcely perceptible at the height of 15,500 toises; and Silberfeld found the greatest height of the fire-ball, which appeared in July 1762, to be 72,276 toises. On this account their origin, as Reimarus and Chladni have supposed, is not to be ascribed merely to electricity; but others have considered them as produced by the action of the electric fluid between the clouds and the northern lights; and this hypothesis sufficiently corresponds to their actual height, because by the measurement of
of Bergman, Kaufner, and Lambert, the northern lights have an altitude of more than 20 or 30 German miles, and according to every appearance, no fire balls have been seen higher. (See Aurora Borealis.) On the other hand, this general conclusion led Halley, Franklin, and Rittenhouse, to adopt the notion ingeniously defended by Chladni, that these phenomena, as well as shooting stars, are comi
cal meteors belonging to the atmosphere of the sun, which, meeting our earth in its course round that luminary, are inflamed, by some cause or other, when they enter the earth's atmosphere. The time of their duration has been very dif
diferent; some of them having continued half an hour, and others not longer than half a minute. Many of them in their course have thrown out sparks, and most of them have been seen to separate into several larger and smaller parts before they entirely disappeared. From this division it has been inferred, that these phenomena cannot be accounted for by the hypothesis of a tract of inflammable air set on fire; to which hypothesis Chladni has objected on other grounds. This separation has been accompanied with a rumbling noise like thunder, or a sudden report. Several, after bursting, seemed to diffuse itself into smoke; but most of them, after exploding, have left behind them no visible traces. In some cases, after their disappearance, a fulphu
reous smell has been perceived, which led Mulchenbroeck to form his hypothesis of an accumulation of fulphurous in
flammable vapours that arise from volcanoes and subterranean pits, which, being driven together by the winds, form clouds that are by some accident or other set on fire; but this hy
pothesis cannot be reconciled with their prodigious height any more than that of Silberchlag's oily and filmy vapours.
As for curious mists, they have frequently been either actually seen to fall at the time of the disappearance of these pheno
mena, or have been soon after found on the surface of the earth; and as it has been sufficiently proved by various ac
counts, that those have fallen from the atmosphere, Dr. Chladni concludes, that both these phenomena are con
nected; but this point can be determined only by future ac
curate observations.

This ingenious professor of Wittenberg, in his "Observations on a Mass of Iron found in Siberia by Professor Pall
las," has investigated the origin of fire-balls in general. This mass, described by Pallas in his "Travels," vol. iii.
p. 311, was found between Kraufnafs and Abekansn, in the high flat mountains, open and uncovered. It weighed 1500 pounds; refigured in a rough granite; was cov
ered externally with a ferruginous kind of crust; and with
in conffituted of mallable iron, brittle when heated, porous like a large sea sponge, and having its interfaces filled with a brittle hard vitrified substance of an amber yellow colour. This texture and the vitrified substance appeared uniformly throughout the whole mass, and without any traces of flag or
artificial fires. This mass, which the Tartars consider as a fa
cred relic dropped from heaven, Chladni refers to the same ori
gin, and supposes to be of the same nature with the bolides, or fire-balls. From a variety of observations relating to these phenomena, he endeavours to prove that they do not arise from an accumulation of the matter of the aurora borealis; a transition of electricity from one part of the atmosphere to
another; an accumulation of porous inflammable substances in the higher regions; or the catching fire of a long train of inflammable air; but that their component parts must be con
fiderably dense and heavy, as their course flew in so ap
parent a manner the effects of gravity; and because their ma
ths, though it diffuses to a monstrous size, retains suffi
cient consiency and weight to continue an exceedingly rapid movement through a very large space, without being decomposed or dissolved, notwithstanding the resistance of the atmosphere. It seems to him probable, that this sub
stance is by the effect of fire reduced to a tough fluid con
dition; because its form appears sometimes round and some
times elongated, and as its extending till it bursts, as well as the bursting itself, allows us to suppose a previous capa
bility of extension by elastic fluidity. At any rate, it ap
pears to be certain, that such dense matter at so great a
height is not collected from particles to be found in our at
mosphere, or can be thrown together into large mists by any power with which we are acquainted; that no power
with which we are acquainted is able to give to such bodies so rapid a projectile force in a direction almost parallel to the horizon; that the matter does not rise upwards from the earth, but exists previously in the celestial regions, and must have been conveyed thence to our earth. In the opinion of Dr. Chladni, the following is the only theory of this phe
nomenon that agrees with all the accounts hitherto given;
which is not contrary to nature in any other respect; and
which besides seems to be confirmed by various masses found on the spot where they fell.

As earthly, metallic and other particles form the principal component parts of our planets, among which iron is the prevailing part, other planetary bodies may therefore con
figur of similar, or perhaps the same component parts, though combined and modified in a very different manner. There may also be dense matters accumulated in smaller mists without being in immediate connection with the larger plan
etary bodies, dispersed through infinite space, and which, being impelled either by some projecting power or attraction, continue to move until they approach the earth or some other body; when being overcome by their attractive force, they immediately fall down. By their exceedingly great velocity, still increased by the attraction of the earth, and the violent friction in the atmosphere, a strong electricity and heat must necessarily be excited, by which means they are reduced to a flaming and melted condition, and great quantities of vapour and different kinds of gases are thus disengaged, which diffure the liquid mists to a monstrons size; till by a still farther expansion of these elatic fluids, they muat at length burst. Dr. Chladni thinks also, that the greater part of the shooting stars, as they are called, are nothing else than fire-balls, which differ from the latter only in this, that their peculiarly great velocity carries them past the earth at a greater distance, so that they are not so strongly attracted by it as to fall down, and therefore in their palling through the high regions of the atmosphere, occasion only a transient electric flash, or actually take fire for a moment, and are again speedily extinguished, when they get to such a distance from the earth that the air becom
t too much rarified for the existence of fire. The pro
fessor illustrates and vindicates this theory, romantic, as he allows, some may be disposed to denominate it, by a variety of reflections; and in some subsequent publications, he has endeavoured to confirm it by adding a great number of other phenomena of a similar kind. He concludes the whole elaborate detail with observing, that the accounts of forious mists, which contained iron, earth, sulphur, &c. having fallen from the heavens, with violent explosions, are not fictions, but true relations of real natural phenomena actually observed at various times; and that fire-balls, and the falling of such mists, are the same meteor. "Respec
ting the question," he says, "whene'er fire balls and such fallen mists proceed, opinions are very different. Most people believe that they are owing to accumulations in the atmo-
atmosphere. But even when it is allowed that a great many foreign substances are dissolved in the atmosphere, the quantity of them, especially in regions at the distance of eighty miles or more, from which such fire-balls are seen to fall in the form of a luminous point, is too small to admit of our supposing such large masses to be formed of it. Should the solid particles, which may perhaps be dissolved in the atmosphere, precipitate themselves, it would be rather in the form of a fine powder. I consider it, therefore, with Anaxagoras, Makelune, &c., as more probable that these masses come to our regions from the common expanse of the universe; and that, besides planetary bodies, there are smaller accumulations of matter, which when they approach too near our earth must fall down. That material bodies actually exist in the remotest regions, is shown both by the sngle and accumulated luminous sparks which Dr. Schröter saw pass over the field of his telescope; as also by the floating stars which pass by our earth, probably at a greater distance and with greater velocity than to allow their being attracted by it, and made to fall to its surface; and to which fire-balls, on their first appearance, when they seem to approach like a luminous point, have a perfect resemblance. There are many reasons for inducing us to believe that floating stars cannot be mere electric phenomena, without the presence of some coarser substances. The paradoxicalness of this mode of explanation, which is contrary to no known observations of nature, is rather apparent than real, and consisits only in this, that people have not been accustomed to it; or that, on account of the rarity of these phenomena, many facts of this kind have been denied, or have escaped notice. For this reason, after I had written the Treatise on the Mafs of Iron discovered by Professor Pallas, I hesitated whether I should publish it, because I expected that it would meet with considerable opposition. The more I endeavoured however to compare, without partiality for any systen, the observations already made, which correspond so much with each other, the more I found that these phenomena could not be properly explained in any other manner, without either contradicting observations already made, or well-known laws of nature; so that I see no grounds for retracting anything I have advanced on this subject. See Height of the Atmosphere, and Meteorology.

**Balls.** In the Military and Pyrotechnical Arts, is a composition of divers ingredients, generally of the combustible kinds, serving to burn and delugroy, give light, smoke, fanch, or the like.

In this senfe we read of fire-balls, light-balls, smoke-balls, fire-balls, sky-balls, water-balls, land-balls, &c.

Balls, Light, are likewise used for all sorts of fire-armes; thofe for cannon are made of iron, and are distinguished by their respective calibres; and thofe for muskets, &c., of lead. Balls, Fire, are bags of canvas filled with gunpowder, sulphur, sulphetpe, pitch, &c., to be thrown by the foldiers, or out of mortars, in order to fire houses, incommodate trenches, advanced posts, or the like.

The Greeks had divers kinds of fire-balls made of wood, sometimes a foot, or even a cubit long; their heads being armed with spikes of iron, beneath which were hemp, pitch, and other combustibles, which being set on fire, were cast among the enemy.

The preparations of fire-balls, among the moderns, consists of several operations, viz., making the bag, preparing the composition, tying, and, lastly, dipping the ball. The bags for this purpose are either oval or round.

The composition wherewith fire-balls are filled is various. To ten pounds of meal gunpowder, add two of sulphuer, one of fulphur, and one of colophony; or, to fix pounds of gunpowder, add four of sulphetpe, four of fulphur, one of powdered glass, half a pound of antimony, as much camphor, a quantity of nitre, and four of common salt, all pulverized. Sometimes they even fill fire-balls with hand granadoes. For tying the fire-balls, they prepare two iron rings, one fitted round the aperture, where the ball is to be lighted, the other near its base. A cord is tied to these rings in such manner as that the several turns represent semicircles, or meridians of the sphere, cutting the globe through the poles: over the cords, extended according to the length of the ball, others are tied, cutting the former at right angles, and parallel to each other, making a knot at each interfection. Lastly, putting in a leaden bullet, the ret of the space is filled with tow or paper. Thus completed, the fire-ball remains to be dipped in a composition of melted pitch, colophony, and linseed oil, or oil of turpentine; after dipping, they cover it round with tow, and dip again, till it be brought to the just diameter required.

**Balls, Land,** thofe which, being thrown out of a mortar, fall to the ground, burn, and burst there. The ingredients are much the same as in the water-balls, only the specific gravity is not attended to.

**Balls, Light,** are such as diffuse an extensive light around: or they are balls which, being cast out of a mortar, or the hand, burn for some time, and illuminate the adjacent parts.

These for the hand are made of ground powder, sulphetpe, brimstone, camphor, and borax, all sprinkled with oil, and moulded into a mass with fuel, common and Greek pitch, to the size of an ordinary granado: this is wrapped up in tow, with a sheet of strong paper over it. To fire it, a hole is made into it with a bodkin, into which is put some priming that will burn slowly. Its use is, to cast into any works that are to be discovered in the night time.

For the larger light-balls, or thofe to be thrown to a greater distance, they are prepared by melting equal quantities of sulphur, turpentine, and pitch; and by dipping in this composition an earthen or stone ball, of a diameter much less than that of the mortar out of which the fire-ball is to be cast; then rolling it in gun-powder, and covering it round with gauze, the dipping is repeated till it comes to fill the cavity of the mortar; lastly, it is sprinkled around with gun-powder. This being once kindled, will strongly illuminate all round the place where it is thrown, and give opportunity for examining the state and condition thereof.

**Balls, Sky,** thofe cast on high out of mortars, and which, when arrived at their height, burst like rockets, and afford a spectacle of decoration. Sky-balls are made of a wooden shell, filled with various compositions, particularly that of the stars of rockets.

These are sometimes intermixed with crackers and other combustibles, making rains of fire, &c.

**Balls, Smoke, or Dark,** thofe which fill the air with smoke, and thus darken a place, to prevent discoveries. To prepare a darkening ball, make a oval or spherical bag; melt rosin over the coals, and add an equal part of sulphetpe not purified, also of sulphur, and a fifth part of charcoal. The whole being well incorporated, put in tow sifted, and fill the bag with this composition, and dip it after the same manner as a fire-ball.

**Balls, Sink,** thofe which yield a great fink where fired to annoy the enemy.

Their preparation is thus: melt ten pounds of pitch, fix of
of rosin, twenty of saltpetre, eight of gun-powder, and four of colophony; to these add two of charcoal, fix of horse-hoofs cut small, three of asafoetida, one of stinking farracan, and any other offensive ingredients. Then proceed as in making smoke and fire-balls.

**Balls, Water**, those which swim and burn a considerable time in the water, and at length burst therein.

These are made in a wooden shell, the cavity of which is filled with a composition of refined saltpetre, sulphur, sawdust boiled in water of saltpetre, and dried; to which sometimes other ingredients are added, as iron-chips, Greek pitch, amber-dust, glafs powdered, and camphor. The ingredients are to be ground and mixt up, and moistened with linseed-oil, nut-oil, olive-oil, hemyseed-oil, or petrol. At the bottom is placed an iron coffin, filled with whole gunpowder that the ball may at last burst with a great noise; and lastly, the ball is, by the addition of lead, or otherwise, made of the same specific gravity with water.

**Balls, Anchor,** are made in the same manner as light balls, and filled with the same composition; and besides, they have an iron bar two-thirds of the ball's diameter in length, and three or four inches square. One half is fixed within the ball, and the other half remains without; and the exterior end is made to grapple with a hook. These are useful for rigging wooden bridges or buildings, the rigging of ships, &c.; as the pile end being the heaviest, flies foremost, and wherever it touches, falls, and sets fire to all about it.

**Balls, Chain.** See Chain-balls.

**Balls, Stagg.** See Stagg-balls.

**Balls, in Mineralogy,** is also used in Cornwall, &c. for tin-mines.

In this sense Godolphin's ball is said to be the most famous of all the balls or mines in Cornwall, for quantity of metal. Phil. Trans. No. 238. p. 951.

**Ball-Venin,** a name given by the miners in Suffolk to a sort of iron ore, common there, and wooded to considerable advantage. It yields not an extraordinary quantity of metal, but what it has runs freely in the fire; it is usually found in loose masses, not in form of strata, and is often covered with one or more crusts. It generally contains some sparkling particles, and is usually of a circular form in the perfect masses; thickest in the middle, and gradually thinner as it approaches the sides. The ores of Suffolk in general are poor, but they require very little trouble in the working, so that a considerable profit is annually made from them.

**Ball of a Pendulum,** the weight at the bottom. In shorter pendulums, this is called the bob.

**Ball, among Printers,** a kind of wooden tunnel stuffed with wood, contained in a cover of sheep's skin, which is nailed to the wood; with which the ink is applied on the forms, to be wrought off.

The pressman holding one of these balls in either hand, first dabs them on the ink-block, then working them on each other, he applies them afterwards on the forms, which retain the ink necessary to make an impression.

**Balls for Horses,** in Veterinary Science, masses made into this form which is the most useful and most convenient mode of administering medicine to these animals.

Being mixed with some volatile substance, the proposed medicine is formed into masses of an oblong or oval form, which are conveyed by the hand or otherwise to the root of the tongue, from whence they readily pass to the stomach.

This mode of administering medicines to horses is of great antiquity. These balls were termed by the Romans **cassia**; by the Greeks, **σταφυλία**. They, however, generally preferred giving their remedies as a potion or drink. The kinds of balls will necessarily be as various as the nature of the medicine which is administered; as purging balls, cordial balls, diuretic, diaphoretic, febrifuge, worm-balls, cough-balls, alternative balls, &c. Any tenacious substance not possessing active properties, will serve for the admixture of them, as paste made of boiled flour, or boiled linseed where they particularly serve for balls that are to be immediately given, and not kept for any length of time, as they are apt to grow hard and dry, and sometimes mouldy. To prevent this, they may be immersed in melted wax, which will effectually coat them over and preserve them, and this was a mode also well known to the ancients. Honey, treacle, turpentine, and tar, are not subject to the above objection, and are all used by different persouls for this purpose. The two last, however, cannot be suppos'd devoid of effect as a medicine; and therefore should not be employed, unless when they co-operate with, or do not destroy, the effect of the medicine preferred.

Soft soap is also an adhesive particularly useful in the admixture of diuretic and purging balls for horses, as not drying nor being particularly expensive. Aloes, almost the only purgative at present known for horses, operates better when united with this substance than in any other way that we have tried. Calomel also operates as a purgative on horses. For the particular method of preparing them, see **Pharmacopoeia Europae.**

These balls should not be made too large, or be suffered to get too hard; is either case, by lodging in the eosophagus, they may prove fatal.

It may not be unnecessary also to observe, that for the easy administration of them the following circumstances should be observed. The tongue should be drawn from the mouth with the left hand over the grinder teeth, the right hand holding the ball between the thumb and first finger, the ball should then suddenly and at once be thrust into the throat by gliding the hand along the roof of the mouth; when this is done slowly, the tongue rises, opposes the hand, and renders it difficult. An iron ring with a handle is sometimes used to defend their jaws; but in this country these balls are generally given without.

When the jaw is very narrow so as not conveniently to admit the hand, the ball is placed on the end of a pointed stick, or it might be placed loosely in a cup or socket at the end of a small cane or whalebone, and be thus very conveniently given.

**Balls, in Zoology,** various substances under this form found in the stomach and intestines of several animals, they occur most frequently in those quadrupeds which lick the surface of their bodies, in which case they are composed of the hair that has been removed by the tongue; the hair, partly by the operation of licking, and still more by the motion of the stomach, becomes mixt and interwoven in such a manner, that it resembles the texture of a hat, and when moulded into a round figure, receives a smooth, shining coat, or calculus incruration. These are the sort of balls usually met with in the cow, sheep, and goat kind, especially the chamois. Every indigible substance that is swallowed is liable, however, to give origin to these balls, or to form a nucleus for calculous concretion; hence we meet with them composed of the ready fibres of vegetables, banks of seeds, feathers, and different animal and vegetable excreta. When such substances as flones of fruit, nuts, or inorganic substances, as puehler, coins, &c. are long detained, and have been covered with a deep incruration, they constitute the bezoar-like flones.

See **BIZARS.** See also **ÆPhagopilas.**

Accord-
According to authors, the human subject is liable to the formation of balls in the intestines, in consequence of indigestible matters not being regularly expelled. Thus cuces have been visited of death ensuing from accumulations of gooseberry seeds, which had been rolled into a solid ball in the stomach; and Sir Hans Sloane gives the history of a ball found in the intestines of a man, much afflicted with the colic, six inches in circumference, of a pungy subflunce, and which, when viewed with a microscope, appeared made up of small transparent hairs or fibres, wrought together like the *tophus bovinus*; in the middle was a common plum-bone, which made, as it were, the core or nucleus upon which the fibrous matter had collected, the same being the length. Phil. Trans. N. 359. p. 2587. Sloane, in Phil. Trans. N. 272. p. 1282.

**BALLS of Silk-worms and Spiders.**—little cysts or cocoons woven of silk, wherein those insects deposit their eggs. See *Silk.*

Spiders are extremely tender of their balls, which they carry about with them, adhering to the papillæ about their anus. Grew speaks of balls as bags of a species of silk-worms in Virginia, as big as man’s eggs, and containing each four *auricles.* Phil. Trans. N. 352. p. 1037.

**Ball of the Foot of a Dog,** is the prominent part of the middle of the foot, called by Latin writers of the middle age, *pelta,* which is to be taken away in expeditation. Ducange Gloss. Lat.

**Balls, Billiard,** are ivory balls used in the game of billiards. Moxon describes the method of turning hollow ivory balls one within another. Mechan. Exerc. p. 219.

**Ball, Tennis,** is a little globe, made and covered with cloth or leather, used in playing at the game of tennis.

**Ball is also used,** in a well-known sense, for an assembly of both sexes, who dance to the sound of instruments.

**Balls, Glove.** See *Glass-Balls.*

**Balls, Soap.** See *Soap.*

**Ball and Socket,** a machine contrived to give an instrument full play and motion every way. It consists of a ball or sphere of brass, fitted within a concave semi-globe, so as to be moveable every way, horizontally, vertically, and obliquely. It is carried by an endless screw, and is principally used for the managing of surveying instruments; to which it is a very necessary appendage.

The ancient balls and sockets had two concaves, or holes, the one for the horizontal, the other for the vertical direction.

**Balls, Wool.** See *Wool.*

**Ball’s Pyramid,** in Geography, a rock in the great Southern Pacific ocean. S. lat. 31° 30’. E. long. 159° 8’.

**BALLABUAN,** Sirets of See *Ball.*

**BALLAD, or Ballet,** a popular song containing the recital of some action, adventure, or intrigue.

The French confine their ballads to shorter terms. A ballad, according to Richet, is a song confining three strophes, or stanzas, of eight verses each, besides a half strophe; the whole in rhyme, of two, three, or four verses, with a burden repeated at the end of each strophe, as well as of the half strophe.

In the old English version of the Bible, the book of Canticles is intitled the *ballad of ballads,* which has given scandal to some Romish writers as countenancing the opinion of those who hold that book a ballad of love, or a recital of the amours between Solomon and his concubine, as Callallo and some others have conceived it to be.

Some have suggested that a collection of ballads is necessary to a minstrel, in order to learn the temper and inclinations of a people, which are here frequently uttered with great simplicity. The great Cecil, chief minister to queen Elizabeth, is said to have made a most ample collection of ballads on this account.

A very ingenious political writer, Mr. Fletcher of Saltoun, says, that if he could but make the ballads of a nation, he would care very little who made the *religion of it.* There is a very curious collection of old English and Scotch ballads, published in 3 vols. 8vo. by Dr. Percy; in which, and in a dissertation prefixed to Aikin’s Collection of Songs, &c. the curious in this way may find abundance of entertainment and information concerning the old ballads, and ballad-makers.

**Ballad,** a mean and trifling song, generally, such as is sung in the streets. In the new French Encyclopedie we are told, that we dance and sing our ballads at the same time, as the French do their *mouvelleres.* We have often heard ballads sung, and seen country-dances danced; but never at the same time, if there was a fiddle to be had. The movement of our country-dances is too rapid for the utterance of words; though the term ballad, we have no doubt, was derived from the Italian *ballata,* a song to be sung and danced at the same time, as it is defined in the Cricula Dictionary: *cancione, che fi' conta ballando.* Ballatella, and Ballatetella, are diminutives of the same word: *piccola canzoni, una balla.* The English ballad has long been detached from dancing, and, since the old translation of the Bible, been confined to a lower order of song. In Shakespeare’s time this species of vulgar and popular poetry was wholly degraded and turned into the streets—

"Ah I have not ballads made on you all, and sung to filthy tunes, may a cup of sack be my poison."—Hen. IV.

**BALLADUK,** in Geography, a town of Arabia Deserta, 140 miles E. N. E. of Damascus.

**BALLAGAULT,** denoting the higher or upper Gaunts, an elevated tract of the peninsula of India, being the western part of the Carnatic, or of that part of the peninsula that lies south of the Gondekana and Toombuddha (or Tungabhadra) rivers, from the coast of Coromandel eastward to the Gaunt mountains westward, and containing the districts which lately composed the country of Tipoo. The other or eastern part, which is the Carnatic according to its present definition, is denominated *Payen-Gaut,* or the lower Gaunts. (See *Bala-gaut.*) The *Ballach-Gaut* mountains denote that elevated tract, across which goods were formerly conveyed from Tagara, or the modern Dowlatabad, to Baza, See Atlas Restrach, vol. 1 p. 369, &c. 8vo.

**BALLAGHAN POINT,** a cape on the east coast of Ireland, in the county of Louth, at the south-west entrance of Carrigford bay; eleven miles south-call of Newry. N. lat. 53° 57‘. W. long. 6° 42‘.

**BALANTIRKE,** or *Ballantrae,* a sea-port town or rather populous village of Scotland, on the west coast of the county of Ayr, in that subdivision called Carrick, on the frith of Clyde, containing about eighty houses, and 500 inhabitants. They have a good salmon fishery at the mouth of a small river called Ardlinchar which joins the frith near the town; but the principal fishery of this district is that of haddock, whiting, cod, ling, skate, &c.: twenty-eight miles S. S. W. of Ayr.

**BALLARD, Cape,** lies on the east coast of Newfoundland, four leagues N. N. E. from cape Race, and four miles from Fresh-water bay. N. lat. 46° 39’. W. long. 52° 46‘.

**Ballard’s Point,** a cape on the west coast of Ireland, in the county of Clare. N. lat. 52° 42‘. W. long. 6° 32‘._BALLA._
BALLARINA, in Ornithology, a name under which Oliva describes the white-wagtail, Motacilla alba.

BALLAS, a town of Egypt, ten miles south of Dendera.

BALLAST, in Navigation, any heavy matter used to sink a vessel to its proper depth in water, or to give it a just weight and counterpoise, and enable it to bear full upright, without overturning.

The word comes from the Flemish belaff, formed of bel, and laff or laft. The French call it simply laff. In the Mediterranean, quartalige. In Latin writers of the lower age it is denominated lâqueum.

The ordinary ballast is sand or shenes, flowed in the bottom, or hold, next the false keel of a vessel: sometimes, iron, lead, corn, or other heavy goods, serve for ballast. Ships are laid to be in ballast, when they have no other loading.

That ballast is belt which is heaviest, lies closest, and driest, both for the ship, bearing a fail, flowing of goods, health of the company, and saving of cales and other. If a ship has too much ballast, she will draw too much water; if too little, she will bear no fail. The ballast is sometimes one-half, sometimes a third, and sometimes a fourth part of the burden of a vessel. But there is often great difference in the proportion of ballast required to prepare ships of equal burden for a voyage; the quantity being always greater or lefs, according to the sharpness or flatness of the ship's bottom, which beam call the floor.

Although ships in general will not carry a sufficient quantity of fail till they are laden to deep that the surface of the water will nearly glance on the extreme breadth amidship, yet a great weight of heavy ballast, as iron, lead, &c. in the bottom, will place the centre of gravity too low in the hold; and in this case, though they may be able to carry a great fail, they will move heavily, and hazard being dismasted by their violent rolling. The art of properly ballasting a ship is that of disposing the materials of which it consists, &c. so that it may be duly poised, and maintain a just equilibrium on the water, and be neither too flat nor too cramp. In the first case, though the ship may be able to carry a great fail, yet its velocity will not be proportionately increased, whilst her masts are more endangered by her sudden jerks and excessive labouring; and in the last case, she will be incapable of carrying fail, without the danger of overfetting. Stiffness in ballasting is occasioned by laying a great quantity of heavy ballast, as lead, iron, &c. in the bottom, which of course will place the centre of gravity very near the keel; and cranks will be occasioned by having too little ballast, or by dispoising the ship's lading in such a manner as to raise the centre of gravity too high.

As the tendency of a ship to pitch or roll depends, not only on her form, but also in a greater degree upon the due distribution of the heaviest part of her cargo, the knowledge of properly ballasting a ship, as well as of flowing her cargo, is of great importance to the mariner. Particular attention should be paid to moderate her pitching, as this most fatigues a ship and her mails; and it is usually in one of these motions that masts break, particularly when the head rises after having pitched. Rolling, indeed, is a more considerable movement than pitching; but it is low, and seldom attended with any accident. However, it should be prevented as much as possible; and this may be easily done in general, without any detriment to the ship's full carrying of fail, by flowing up the ballast, when it is iron, to the floor-heads; because the ship will be restored by it with less violence after she has inclined, and it will act on a point at a little distance from the centre of gravity.

For the farther illustration of this important subject, let it be premised, that various methods have been recommended for finding the following points of a ship; viz. its centre of gravity, centre of cavity, centre of motion, and metacentre. (See these articles.) Some of these points are fixed; others are variable. When a ship is completely loaded, the centre of gravity is fixed, howsoever the vessel may alter her position. The centre of motion is always in a line with the water's edge, when the centre of gravity is even with or below the surface of the water; but, whenever the centre of gravity is above the water's surface, the centre of gravity is then the centre of motion. In circular motions the centre of motion will be the centre of the circle. The centre of gravity varies with every inclination of the ship, because that depends upon the shape of the body immersed. The metacentre, called the floating centre, depends upon the situation of the centre of gravity; for it is that point where a vertical line drawn from the centre of gravity cuts a line passing through the centre of gravity and perpendicular to the keel. The centre of gravity must not by any means be placed above this point; because, if that were the case, the vesse would overfet.

Let the segment of a circle 1 2 3 (fig. 14, Plate II. Mechanics), represent the transverse section of a vessel's bottom; W L the surface of the water; M the metacentre as well as the centre of motion, because this is a circle; C the centre of cavity; G the centre of gravity; and the line 2 4 the vertical axis of the vesse which may be turned round the point M, as on a fulcrum, supported by the centre of cavity. By thus simply considering the vesse as a lever in the direction of her vertical axis playing round her centre of motion, it is plain, that if the centre of gravity was placed above the point M, being the metacentre too, the vessel would upset; therefore that the ship may have stability, the centre of gravity must be below this point: and it may be observed, that the farther G is removed from the metacentre, the greater must be its force, as the gravity then acts with a greater length of lever, considering the fulcrum of that lever to be at the centre of motion; or, if the weight at G be augmented, it will likewise increase the force; therefore the force of G may be expressed, by multiplying the balance of weight beneath the centre of motion, by the distance of the centre of gravity from the centre of motion.

The centres of cavity and motion (in circular bodies) will ever be in a line perpendicular to the horizon, but the centre of gravity may be either on one side or the other of this line. When such a body is at rest, the centre of gravity will be in this line; but if in motion it will be diverted from it. Thus the points M and G, will always be perpendicular to W L; but the point G, by the body's rolling, may be on either side; for instance at g. While G is perpendicularly beneath the centre of motion, its action can only tend to preserve this circular body in its erect position; but if it is removed to either side as g, its action is to return it to the erect position; and this action increases as the distance G g, which is the sine of the angle of roll g M G, the distance M G being considered as the radius. Thus, to gain the force of gravity with any roll as g M G, let the balance of weight beneath the centre of motion be multiplied by the sine of the angle of roll G g.

But the tendency to roll may be also diminished by the shape of the hull; for, let us suppose that the transverse section be allowed more beam, and increased by the dotted lines. Now when this vessel is rolled over, it is plain that the cavity will be augmented towards the side L, of course its...
its centre must remove towards L, say to c; and, if from c be erected a perpendicular to the horizon, it will cut the vertical axis at n, which will, in this case, be the metacentre, above which, if the centre of gravity were placed, it would act in conjunction with the centre of cavity to overfall the vessel; but, as the centre of gravity is here below it at g, her liability will be increased by the increased distance of G from c, the metacentre; and the vessel will roll round the point M as her centre of motion.

When falling in smooth water, the greater the liability the better; but if a vessel with a heavy cargo, flowed low in her bottom, be set out into a rough tempestuous sea, where every wave will throw her from her equilibrium, she will return with such violence as to endanger her masts, and should she be dismasted, her roll will then be with greater force, possibly to the destruction of her hull. Was the cargo in this labourous vessel to be removed higher up towards the centre of motion, so as to lessen her liability, she would be found considerably easier; her roll would be by such deliberate motions, as to lessen the danger to her masts and hull.

The ballast is placed round and very near the centre of gravity of the ship, because it will prevent the motion of the pitching being so hard as it would be, if that weight were distributed either aforesaid or abaft that point. Whenever the sea runs a little high, the ship is never carried by a single wave; there are generally two or three always pailing under at the same time, unless when the sea is extremely long, the swells comes from a great distance, and in latitudes very remote from land; for then, it happens that the largest ships are sometimes carried by one single wave. But, in either circumstances, the ballast ought not to be stretched aforesaid or abaft the centre of gravity, as soon as the ship is in the parallel to her draught of water marked for the ballast, which is absolutely essential to pay attention to.

To prove this principle, suppose in either case a long or short surge, and that the water strikes the ship forward, that thereby she may be expected to the greatest and hardly pitchings; for when the wave takes a ship under the stern, her motions, if she has got a little head-way, are not dangerous; because, as the ships goes, and it goes through it, at the same instant that she is raised by the vertical impulse of that column of water, which opposes her a supporting power too considerable for her weight to displace the wave which follows produces the same effect in receiving the fall of the ship, because the first is already under the middle of the ship, whence it pails to the stern, which is supported by it, while the second takes its place in the middle, and the third is come to support the head; and this is an uninterrupted succession. This motion continuing thus long as the sea is agitated, it follows that the ship is never at rest; no sooner has she been raised by a wave, but she falls again when that wave is gone, which falling is proportionably less sharp as her head is less heavy; the shake is then less violent, since the shocks the water with a less mass, which prevents her pitching so deep as she would, if the wave more heavy; consequently, the making does not suffer, and the headway is less delayed, as the fullest part of the bow is not so much exposed to the shock of the water.

Secondly, when the ship is carried by one single wave, her fall is still less sharp, if little loaded a-head, than when she is carried only by the middle. She rises, therefore, more easily at the moment the other wave comes to strike her, and the shake is not so violent. Was she to plunge deeper into the fluid, it might happen that the column of water would become higher than her head, and, falling partly over it, would expose her to the danger of foundering.

In the flowing of the cargo, it is proper to place the heaviest part of the flowage as well as possible, taking care to provide that draught of the ship which is most advantageous for her, whether the ship be a ballast or when laden. Those points are marked both at the middle and stern; in a word, the great art of flowing lies, in endeavouring that each of the vertical parts, in which the extremities of a ship may be supposed to be evenly divided, be lighter, when her loading is complete, than the weight of the mass of water they are to displace; observing always, that the vertical parts of the middle admit of being headed more heavily than the weight of water they are able to displace.

In the royal navy, the iron ballast is first flowed fore and aft, from bulkhead to bulkhead in the main hold, next to be laid on the timber-stakes on each side the kelton, five or more inches clear of the timber-boards; and is winged up three or more pigs above the floor-heads in the middhips, or bearing part of the ship, and there are two tiers of pigs in the wake of the main hatchway and well-wings. Ships, built with a very clear run aft, seldom have any iron ballast flown abaft the pump-well or after-hold. Ships that have floor and forecastle riders, have the iron ballast flowed either lengthways or athwart ships, agreeably to the length of the chambers, which are the clear spaces between the riders.

The single ballast is next spread and levelled over the iron ballast; on which is flowed the ground tier of water, bung up and bilge free from the sides, either chine and chine, or boundary and chine, beginning at the coal-room bulkhead, that being the foremost, and making the breakage, if any, at the main hatch. The midhip tiers, fore and aft, are the first laid down, and the keels are tunned about one quarter of their diameter into the thistle; the fides are filled in with wingers of small casks, as half-hogheads, gang casks, or breakers; observing not to raise the wingers above the level of the tier, to cause a breakage in the next tier above, which is flowed in the continuance of the ground tier, bung up and bilge free; and so on, for as many tiers as can be flowed sufficiently clear of the beams.

In the after-hold, between the aft-side of the pump-well and forecastle bulkhead, are flowed the provisions above the ground tier; between the casks, billet, or other wood, and single ballast.

In the fish room are flowed some of the spirits, or wine, and sometimes coals; and in the spirit room, are flowed the wine and spirits for the ship's use.

In the merchant service, the flowage consists, beside the ballast, of casks, barrels, boxes, &c. which are all carefully wedged off from the bottom, fides, pump-well, &c. and great attention paid that the most weighty materials are flowed nearest to the centre of gravity, or bearing of the ship; and higher or lower in the hold agreeably to the form of the vessel. A full low-built vessel requires them to be flowed high up, that the centre of gravity may be raised, to keep her from rolling away her masts, and from being too fluff and labouroume; as, on the contrary, a narrow high-built vessel requires the most weighty materials to be flowed low down, nearest the kelton, that the centre of gravity may be kept low, to enable her to carry sail, and to prevent her oversteering.
BALL

By the 19th Geo. II. it is enacted, that if after June 1, 1746, any master or owner, or any person acting as master of any ship or other vessel whatsoever, shall cast, throw out, or unlade, or if there shall be thrown out, &c. of any vessel, being within any haven, port, road, channel, or navigable river within England, any baliff, rubbish, gravel, earth, stone, wreck, or filth, but only upon the land, where the tide or water never flows or runs; any one or more justices for the county or place where or near which the offence shall be committed, upon the information thereof, shall summon or issue his warrant for bringing the master or owner of the vessel, or other person acting as such, before him; and upon appearance or default, shall proceed to examine the matter of and upon proof made thereof, either by confession of the party, or on view of the justices, or upon the oath of one or more credible witnesses, he shall convict the said master, &c. and fine him at his discretion for every such offence any sum not exceeding 5l. nor under 5s. &c.; and for want of sufficient divers, the justice is to commit the master, or person acting as such, and convicted as aforesaid, to the common gaol or house of correction, for the space of two months, or until payment of the penalties.

Besides the above general act relating to ballast, there are the 6 Geo. II. c. 29. and the 32 Geo. II. which regulate the ballasting of merchant vessels in the river Thames, placing it under the direction of the corporation of Trinity-house. Elements and Practice of Rigging and Seamanship, vol. ii. p. 285, &c.

Ballast, to trench the, denotes, to divide the ballast into two several parts or more, in the ship's hold, commonly done to find a leak in the bottom of a ship, or to uniform her. Ballast, the, boats, that is, rams over from the one side to the other. Hence it is that corn, and all kinds of grain, is dangerous lodging, for that is apt to shoot. To prevent which, they make packets that is, bulk-heads of boards, to keep it up flat, that it may not run from side to side, as the ship heels upon a tack.

Ballastage. See Lastage.

Ballatoons, large, heavy baggage-boats, carrying goods by the river from Alfranci and the Caspan sea to Moscow. These will carry from a hundred to two hundred tons; and have from a hundred to a hundred and ten, or twenty, men employed to row, and tow them along.

Ballenden, or Bellenden, for John, in Biography, an elegant Scots writer of the sixteenth century, descended of an ancient and honourable family in Scotland, was probably born and educated in France. Having in his youth served in the court, and, as some writers suggest, having been employed in the education of James V., he was distinguished by the favour and patronage of that prince, and obtained extraordinary preeminence in the church, as well as the office of clerk of accounts, occupied by his father Mr. Thomas Ballenden of Auchinoul, in 1541. The work by which he gained the highest reputation, was his translation of Hector Boethius out of Latin into the Scots tongue, performed by the command of his royal master, intitled, "The History and Chronicles of Scotland, &c." and published in folio at Edinburgh, A.D. 1556. This version, in which the translator took the liberty of augmenting and amending the original as he thought proper, was well received both in Scotland and England, and soon became the standard of that history. In the succeeding reign, he was one of the lords of seccion; and being a zealous Romasist, he industriously laboured, in conjunction with Dr. Laing, to hinder the progress of the reformation. His zeal involved him in disputes, which obliged him to quit Scotland, and remove to Rome, where, it is said, he died A.D. 1550. He was a man of great parts, and one of the finest poets of which his country could boast. His works, that are still extant, are distinguished by that noble enthusiasm, which is the soul of poetry. His poem, intitled "Vertue and Vye," was addressed to the monarch of the Scots, James V.; and his other pieces, both printed and in MS. are now buried in oblivion. In Carmichael's collection of Scottish poems, there are some of this author on various subjects.

Ballenden Point, in Geography, a projecting point in the bottom of Donegal bay, on the north-west coast of Ireland, south-west by south 3° south. Eight miles from Eniforny island.

Ballennes Islands, are four small islands on the south of Tory island, off the N.W. point of Ireland, called Beg, Doway, Boin, and Maghere Wellez. Between Trey island and Balleness, there is a good road and safe anchorage from a foreshore or easterly wind.

Ballentay Port is about 24 leagues east from Skerries island, or port Rufe, upon the main, on the north coast of Ireland; south and somewhat west from Rathlin island, and Dummer's rocks.

Balleroi, a town of France, in the department of the Calvados, and chief place of a canton in the district of Bayaux, six leagues south of Caen, and 24 S. S. W. of Bayeux. The place contains 1176 and the canton 14,484 inhabitants: the territory includes 1975 kilometres and 29 communes.

Ballerus, in Icethy logy, the name under which the Greenland cryptus fatus is noticed by Jons. and other old authors.

Ballerus, a species of Cyprinus, with forty rays in the anal fin. Linnaeus Fn. Svec. This fish inhabits the lakes in some parts of Europe, and near the Caspian sea. The head is small, obtuse, and brown in the front; cheeks and gill-covers alternately blue, yellow, or red; eyes large; iris yellow, with two black spots; jaws equal, lower one curved; back carinated; lateral line straight, variegated with brown dots; edges of the fins blue; dorsal fin placed farther back from the head than the pectoral one; anal fin very broad; tail lunate. Weight in general about a pound; deposits an immense number of eggs in April; grows slowly, is thin, and covered with minute lax scales: the colour above is blackish-blue, yellowish on the sides, silver below, and red on the belly; fish not very good. Bloch observes that the number of rays in the anal fin amount to one more than Linnaeus mentions, and characters the species as having forty-one rays in the anal fin; cyprinus pinna ani radix 41. Bloch.

Balliet, or Balet, Baletto, a kind of dramatic poem, representing some fabulous action or subject, divided into.
Ballet is one of the longest and most elaborate articles of the new French Encyclopedist. When M. Framery seems to have exhausted the subject, it is resumed by his colleague in the musical department, M. Guignené, who has still found much to say on the subject. Ballet, he informs us, is a term that includes three different kinds of exhibition on the Lyric stage. In the first, the dance constitutes only a subordinate part of the action represented; in the second it is the principal part, poetry and vocal music then becoming accessories in their turn; and, thirdly, in the whole ballet is performed in dancing; and in representing an action in which the performers neither speak nor sing; they dance. The first kind is simply called a ballet; the second a ballet-opera, or opera ballet; an opera with dances analogous to the drama; the third is called a pantomime ballet.

"To treat this subject in its full extent (Era M. Guignené) would require a volume."—And an excellent volume has already been written on the subject, by the celebrated Noverre, intitled "Letters sur la Danse," 1760. In 1774, M. Cahusac had published a pleasing work in 3 vols. "Sur la Danse ancienne et moderne," an historical treatise. But father Menettier's treatise, "Des ballets anc. et mod. selon la rigle du Theatre," 1682, is perhaps the most curious of them all, in the historical part.

Music is so inseparable from the dance, that the word ballet may be regarded as a musical term. The music to opera dances is to be furnished by the composer of the airs and relatives. Half, Jonelli, and Gluck, distinguished themselves as much by the music of grand ballets, as by the opera itself; as did our countryman Dr. Arne, by the dances in Comus. Of late years, it has been generally allied to the principal second violin to compose the music and head the band, in the dances between the acts of an opera. Ayris, Nofèrè, and Le Brun the hangabout player, performed this office during many seasons; and their business was executed for a considerable time to the satisfaction of the public and the performers, by the late Sig. Boffi. The airs of many ballets were usually brought from France, particularly those of Rameau; but Teller, a German, about twenty years ago, acquired great reputation by the music of his chaconnes and ballets héroïques. See Dance, and Pantomime.

Ballet, in English Poetry, etc. See Ballad.

BAILEY, ROBERT, in English Literature, born at Geneva, in October 1726, became a distinguished practitioner of medicine in that city, where he lived much esteemed, to the year 1774; and published the following: "Dissertations sur l'Education Physique des Enfants," Paris, 1762, 8vo. "Dissertations sur les cas constitutifs de la mort d'un affai grand nombre d'Enfants," etc. Geneva, 1775, 8vo. Eloy, Dict. Histoire.

BALLEZE, BALLIZ, of WALLIS, in Geography, a river in the peninsula of Yucatan, New Spain, runs north-easterly above 200 miles, and discharges itself into the bay of Honduras, opposite to the north end of Turneff island. By the treaty of peace in 1783, it is agreed that British subjects shall have the right of cutting and carrying away logwood in the district lying between this river and that of Rio Hondo on the north, which falls into Hanover bay. The unalterable boundaries are the course of the rivers.

BALLEYACE, in Ancient Geography, a town of Illyria, in the vicinity of Apollonia. Strabo.

BALLAGE, a small duty paid to the city of London, by aliens, and even denizens, for certain commodities exported by them; which they claim by their charter, dated the 5th of September, in the sixteenth of Charles II. confirmed by the twentieth rule of the Book of Rates and by W. & M. cap. 8.
BALLIANI, John Baptist, in Biography, a senator of Geneva, was born in 1586, and distinguished himself among natural philosophers by a Latin treatise, "On the natural motion of heavy bodies," first printed in 1638, and republished in 1646, with many valuable additions. Having passed with honour through many public offices, he died in 1666.

BALLIBAY, in Geography, a market and port town of the county of Monaghan, province of Ulster, Ireland, situated 52 miles north by west of Dublin. This town was in an wretched state; but of late years, since the establishment of its linen market, it is greatly improved, and several new houses have been built. There is a market-house, and a market on Saturdays, at which webs are purchased to the amount of 1500l. weekly. In the neighbourhood of the town are the extensive bleach greens and mills of Crieve, at which 50,000 webs are bleached. Turf is so abundant, that it is sold in the town of Ballibay at 6d. for a horseload. A district called the Calibils, in this neighbourhood, is remarkable for producing a heavy crop of flax, equal to twenty-eight stone of scutched flax to the quarter of an acre, and from one baleth of feed town; this is an immense produce, but the quality is proportionately coarse. Sir Charles Coote's Statistical Account of Monaghan.

BALLIBOY, a small port and fair town of the King's county, province of Leinster, Ireland, situated on the Silver river, and giving name to one of the baronies in that county, which from the average rent, rated by Mr. Young, and compared with that of the other baronies, seems to contain the world ground in it. Distance from Dublin 56 Irish miles. N. lat. 53° 8'. W. long. 7° 39'. Young's Tour.

BALLIELLA, or Ballieala Point, the south-east point of Galway bay, on the west coast of Ireland, eleven leagues north-east by east from Loup's head.

BALLIMONY, a port and market-town of the county of Antrim in Ireland, not far from Coleraine, and 1075 Irish miles from Dublin. It is a pretty large town, and has a good market, especially for linens, £40,000, wide, called Coleraines. Between it and Ballymena is much grazing land, from which Belfast is in great measure supplied with provisions for exportation. N. lat. 54° 1'. W. longitude 6° 22'.

BALLIMORE, a small port town, or rather village, of the county of Wefmeath, in Ireland, seated on the well side of Lough Seudy. It was a strong garrison of the English forces towards the latter end of the war of 1641, being conveniently situated between Mullingar and Athlone, and deriving great advantage from the lake. The name of this place implies the great town, and it may probably have declined considerably in importance; but the idea of a great town, when this name was given, must have been very different from that now entertained. Distance from Dublin 50 Irish miles. N. lat. 53° 26'. W. long. 7° 33'. Collect. Hibern. Beaufort's Map &c.

BALLINMORE EAGHEER, a small town, in a detached part of the county of Dublin, in Ireland, pleasantly situated on the Liffey, over which it has an handsome bridge; it has decayed on account of the great southern road from Dublin having been turned so as to pass through Kilcullen. Near this town is Ruffborough, the seat of Lord Milltown, universally esteemed one of the most superb in Ireland, and containing a valuable collection of paintings by several eminent masters. There is also a great natural curiosity in the neighbourhood, the water-fall of Polla-pluca, or the daxon's hole, formed by a river which rises in the county of Wicklow, and here falls into the Liffey. Lord Milltown, the proprietor, has spared no pains to adorn the natural beauties of the spot, having planted its fine hanging banks, and built several cottages and grottoes for the reception and accommodation of the numerous parties that resort to it. Distance from Dublin 17½ miles. N. lat. 53° 7'. W. long. 6° 73'. Wilson's Book of Roads. Dodd's Traveller's Dictionary, 1801.

BALLINMOT, a village in the county of Sligo, Ireland, which deserves to be mentioned, on account of the flourishing aspect which the linen bleachers wear in its neighbourhood. The great exertions of the late Mr. Fitzmaurice, brother to the present marquis of Lansdowne, first established this manufacture, which is spread throughout all the adjoining county. Beaufort, Young.

BALLINA, a town of the county of Mayo, in Ireland, situated on the river Moy, and connected by a bridge over that river with Ardnaboe, in the county of Sligo, forming together one town, which is neat and thriving, and has a brisk market for linen every week. Mr. Arthur Young describes its situation as uncommonly pleasing. It has a salmon fishery, which is one of the most considerable in the island, supplying seventy or eighty tons of salted fish, besides the fresh. It was let for 520l. a year in 1776. This town being near Killala, was soon taken possession of by the French under general Humbert in the late invasion, and many depredations were committed there by the rebels. Its distance from Dublin 159 Irish miles. N. lat. 54° 6' 30'. W. long. 8° 59'. Beaufort, Young.

BALLINACOURTY POINT, a cape on the south coast of Ireland, in the county of Waterford, and north side of Dungarvon bay, four miles east of Dungarvon.

BALLINAHINCH, a barony in the western part of the county of Galway, and province of Connaught, Ireland, better known by its ancient name of Connamara, or Connachinemara, which implies the chief tribe on the great sea. This large district is very rude and mountainous, and might be expected, very thinly inhabited. Some of the hills are very high; especially the vall ridge called Benmaubola, or the twelve pins, which is a well-known landmark, consisting of almost perpendicular rocks. At the foot of this ridge, close to the little village of Ballinahinch, a charming lake spreads itself for some miles; and on the river which runs from it into Roundstone bay, there is a great salmon fishery. On the fides of the lake, and in the vallies, which are watered by rivers and small lakes, and sheltered in some places by the venerable remains of ancient woods, the soil is mostly inclined to a black bog; but gravel, sand, or rock lie at no greater depth than from one to three feet below the surface. Great quantities of kelp are made all along the coast, and by manuring with sea weed, the land is rendered very productive to the scattered families that inhabit it, who are all little farmers and hardy fishermen. Besides the herring fishery, which employs a great many persons, there is a fishery of mullet on the coast from the 10th of April to the 10th of May, which is carried on by the herring boats. Mr. Young says, that one fish is valued at five pounds, and that if a boat takes three fish in the month, it is reckoned good luck. The number of boats employed is from 40 to 50. The induced shores of this barony abound in well sheltered havens, of which no use is made except by smugglers, who carry on business very extensively, and almost without interruption. The bays of Kilkerran, Birterbuy, Roundstone, and Ballinakill, are the largest, and the fine harbour of Killery, on which is a fishing town, is at the northern extremity of this district. On the promontory of Slymehead, forming the north extremity of Birterbuy bay, is a light house. In this barony are made those woolen rockings, known throughout Ireland by the

BALI
B A L

nans of Connemara, and very good buckles; and the en-
couragement given by the present proprietor (Col. Martin, M.P., for the county) to settlers from Ulster, will probably contribute much to the improvement of what is now one of the most rude and uncivilized districts in Ireland. A late traveller observes, that even in Galway, within 15 miles of it, Connemara was less known than the island of the Paci-
fic ocean; and that he was advised not to venture into it.
Such a dread had the inhabitants of this town of the clan of O’Flaherty, which polished it, that death was threat-
ened, by an inscription over the gate, to every peron of that name found within the walls. Yet notwithstanding
their ancient character, the above-mentioned travellers, in
his ramble through the country, found the people docile and friendly, and left savage in their appearance than the peasantry near the capitals. They are in general much better
clothed, and are more industrious. The women, like those of Wales, knit as they go from one place to another.
Smuggling is very general; and it is considered such an af-
firm for delinquents, that it is not uncommon for poor peasants
to go across Lough Corrib, and calli; and when they are
paid and clothed, take the first opportunity of returning,
after which they are never heard of. There are many traces
throughout the country of its having been cultivated in an-
cient times by some intelligent people. Dr. Beaufort’s Me-
moirs. Mr. Young’s Tour. Latocnaye’s Rambles through Ireland.

BALLINASLOE, a small but neat and well-built town of
the county of Galway, in the province of Connacht, Ireland.
It is situated on the west side of the river Stake (though in many maps it is placed on the east side, in the
county of Roscommon), which river from the nature of the
country might be easily made navigable to the Shannon.
It is one of the most thriving towns in the country, having
a great wool fair on the 13th of July, and several cattle fairs,
at which 10,000 oxen and 100,000 sheep were sold annually
from the parishes of Galway, Clare, and Mayo. From the
increase of tillage, however, and other causes, the num-
ber of sheep is said to have decreased. At one of these
fairs, a flow of cattle and premiums have lately been intro-
duced, under the auspices of the farming society of Ireland,
for the laudable purpose of improving the breeds. The
wool fair was established in 1757, by Mr. Treacy, father of
the present lord viscount Dunker, to whom the town belongs;
and on account of the more convenient situation of Ball-
inloe in the heart of the wool country, and the great at-
tention paid to the accommodation of those who frequent
it, it has taken the lead of Mullingor fair, and is now per-
haps the greatest for wool in the united kingdom.
Several days generally elapse before the buyers and sellers can agree
respecting the price; during which period, the news of the
day is as eagerly sought as on the Stock Exchange, and
often produces a considerable effect. The number of bags,
usually brought to the fair for some years past was about
1500, each containing about eight hundred weight; but
this is feared a fourth part of what is engaged from the
country gentlemen at the same time, at a somewhat higher
price. Mr. A. Young has made a comparison between the
price of wool in the fleece in Ireland, and in Lincolnshire;
from which it appears, that for 16 years ending in 1779,
the average price in Ireland was 13s. 8d. per stone of sixteen
pounds; and in Lincolnshire during the same years, it
was 9s. 3d. for the same quantity. The height of price
in Ireland, he attributes to a decrease in the quantity pro-
duced, from flattering up great tracts of sheep-walks, and
an increase in the consumption. The same causes have con-
tinued to operate in a still greater degree, so that the aver-
age price for four years ending in 1801, was 18s. as
the writer of this article was informed by an eminent manufac-
turer. A good deal of large combing wool was bought
indeed at a lower price, but not fit for the English market.
In comparing the price of English and Irish wool, it should
be mentioned that in Leicetser and Connacht, the bags are
always paid for as wool, which makes an addition of four-
ence per stone to the price. Yet though the price of wool
is so much higher, such is the difference in the price of
labour, that there is in time of peace a considerable export
of worsted yarn to Norwich and Manchester. The dis-
tance of Ballinleee from Dublin is 72 Irish miles. N.
lat. 53° 15'. W. long. 8° 8'. Mr. A. Young. Dr. Beau-
fort.

BAILINROBE, a market, poll, and occasionally an
affixe town of the county of Mayo, in Ireland, which is
small, but flourishing, situated on the River Rube, which
runs into Lough Mask. Here are the ruins of an abbey ;
and in the neighbourhood is a charter school for forty
boys. Within a few miles of it, on the road to Castlebar,
are the ruins of Ballintobee abbey. The part that yet
remains entire of this venerable structure, exhibits a fine speci-
men of Gothic architecture; the rafters, if they may be fo
termied.
term, being formed of heav'n stone joined in a very singular manner. A view and description of this abbey may be found in Ledwich's edition of Grose's Antiquities of Ireland. The distance of Ballintruthe from Dublin is 120 miles. N. lat. 59° 34' 50". W. long. 6° 6'.

BALLINTOY, a small town on the northern coast of the county of Antrim, formerly called Belletrix, which has a tolerably good bay. A vein of coal was discovered here in 1756, which is wrought with such effect, as not only to supply a want hereafter, but others also at Portruith and Colerain. A grant of 2000 pounds was made by parliament in 1758 for improving the harbour. The distance from Dublin is 150 miles. N. lat. 55° 14'. W. long. 6° 12'.

A little to the eastward of Ballintoy, on an abrupt and romantic shore, is a small rocky island called Carrick-a-red. This rock is separated from the adjacent land by a channel full sixty feet in breadth, and of a depth frightful to look at; at the bottom of which the sea usually breaks with an uninterrupted roar among the rocks. This island is particularly well situated for the salmon fishery; but being inaccessible from the water except at one spot, and the turbidness of the sea making it difficult to land even here unless the weather be extremely calm, the fishermen have contrived a finger bridge over the abyss. Two strong cables are extended across the gap by an expert climber, and fastened firmly into iron rings mortised into the rock on each side. Between these ropes, a number of boards about a foot in breadth are laid in succession, supported at intervals by crofs cords; and thus the pathway is formed, which, though broad enough to bear a man's feet with tolerable convenience, does by no means hide from view, "the rocks and raging sea beneath," which in this situation exhibit the fatal effects of a fall in very strong colours, while the swinging and undulations of the bridge itself, and of a single hand rope, which scarcely any degree of tension can prevent in so great a length, suggest no very comfortable feelings to persons of weak nerves. Upon the whole, it is a beautiful bridge in the scenery of a landscape, but a frightful one in real life. Hamilton's Letters on the Coast of Antrim.

BALLISTA, or Balista, in Antiquity, a military engine in use among the ancients, somewhat like our cros-bow, though much larger, more formidable, and more complicated in its construction. It was used in the besieging of cities, to throw stones and sometimes darts and javelins; and received its name from the Greek, παλίστρα, to throw. But in later times it describes the ballista thus: a round iron cylinder is fastened between two planks, from which reaches a hollow square beam placed cross-wise, fastened with cords, to which are added screws; at one end of this stands the engineer, who puts a wooden shaft with a big head into the cavity of the beam; this done, two men bend the engine, by drawing some wheels; when the top of the head is drawn to the utmost end of the cords, the shaft is driven out of the ballista, &c. According to Vitruvius, the ballista was made after divers manners, though all used to the same purpose: one fort was framed with levers and bars; another with pulleys; another with a crane; and others with a toothed-wheel. The ballista was ranked by the ancients in the fling-kind; and its structure and effect reduced to the principles of the fling: whence some writers called it funda and fundibulus. Gæntherus calls it Ballarica machina, as a fling peculiar to the Balearic islands. M. Rolfin joined the account of the catapulta and ballista together (Arts and Sciences, vol. ii. p. 52.), observing that though authors distinguish them, they also often confound them. The ballista was at first chiefly used for throwing stones, and the catapulta for lancing darts and arrows; but by degrees they were confounded and indifferently appropriated to both. (Grose Hist. Eng. Army, vol. i. p. 366.)

The ballista, however, must have been the heaviest and most difficult to carry; because there were always a greater number of the catapulte in the army. Livy, in his description of the siege of Carthage, says there were an hundred and twenty great, and two hundred small catapulte taken; with thirty-three great ballista, and fifty-two small ones. Josephus mentions the fame difference among the Romans, who had three hundred catapulte and forty ballista at the siege of Jerusalem.

Vegetius says, that the ballista discharged darts with such rapidity and violence, that nothing could resist their force. Athenaeus tells us, that Ageantarius made one of little more than two feet in length, which shot darts almost five hundred paces. There were others of much greater force which threw stones of three hundred weight upwards of twenty-five paces. The surpafsing effects of these machines are particularly recorded by Josephus (Bell. Jud. v. 6.); at Jerusalem, they projected stones which beat down the battlements, and broke the angles of the towers; there was in Phialas so deep, but one of them would swamp a whole fle of it from one end to the other; and a man who stood by the breach had his head broken by a stone at the distance of three hundred and seventy-five paces. (Rot-}

Lins Arts & Sc. ii. 52, 53.)Tacitus too has recorded more than one instance of their force. (Annal. xv. 9. Hist. iv. 23.)

Among the Saxons, as we have already mentioned, (see Artillery,) great military engines of almost every kind seem to have been unknown; it is to the middle ages we look for the introduction of any thing like field artillery. William of Poictou (p. 201.) says, that machines for throwing darts and stones were used with great success at the battle of Hastings. The darts that were shot from these machines, as well as from the cros-bows, were called quarrels; and were pointed with heavy pieces of steel like pyramids, which made them very sharp and very destructive. The ballista were more frequently used in sea fights than in battles on shore; nor was this particularly the case in the middle ages; Livy (xii. 21.) says, that both scorpions and ballista were used in the battles by the Tarentines so long ago as 281. Nor was it in the ancient times alone that the names and properties and even the use of the capita- 

a and ballista were confounded. In the Latin of the middle ages, ballista, in lieu of arbalêt, was frequently the term for the crofs-bow; and catapulta for the fling.

Perrault, in his notes on Vitruvius, gives a contrivance similar to that of the ballista, for throwing bombs without gunpowder.

When the ballista is painted in Armor, it is represented as charged with a stone. Gallim and other heraldic writers call it a sweep.

BALLISTA, in Practical Geometry, the geometrical crofs, called also Jacob's staff. See Cross Staff.

BALLISTA, or Os Ballista, is a denomination given by some anatomists to the first bone of the tarsus, otherwise called talus and astragalus.

BALLISTARI1, or Balistarii, in Antiquity, fingers in the ancient armies, or soldiers who fought with the ballista. There were two kinds of ballistarii milites; the former call dotes and other missive weapons with the hand, and were called manuballistarii, or sometimes simply manuballista; the latter, called caroballista, made use of a machine. Some writers speak of a third kind called arcuballista, but these are better reduced to the second. The ballistarii were scarce heard of before the age of Constantine.
B A L

Balillarius in our ancient history is to be differently explained. Sometimes it refers to the men who shot stones and darts out of crosbbows; at others to the officers of the foot-bow-men, or directors of the great brakes or engines, with which the walls of any place were battered; and occasionally even to the flingers. (See Kelham on Doomsday Book, p. 161.) Our kings, so early as the Conquest, had an officer filled Architectural or Balillarius Regis, and lands were held in capite of the king, by the service of presenting annually a crosbbow-string as often as he passed through a certain district. (See Blount's Ten. p. 57. 70. 81.) Walter de Mofely in the thirty-second year of king Hen. III. held lands in Surrey by the fejurne of being the king's balillarius (or crosb-bow-man) in his army for forty days in the year. (Pat. rot. in turrib. Lond.) And it is not perhaps improbable, that the inspector of the works relating to the balistite might occasionally bear the name title. Such an officer occurs in the patent rolls of the same king two years before. (Ibid. 37 Hen. 3. m. 8.)

B A L L I S T I S T E S, in Ethnology. See Ballistes. Ballisteum, or Balistata, in Aniquity, a military fong or dance used on occasions of victory. The ballistai were a kind of popular ballads composed by poets of the lower class, without much regard to the laws of metre.

B A L L I S T I C P e n d u l u m. See Pendulum.

B A L L I S T I C A, Ballistics, is used for the art of throwing heavy bodies. F. Merfenius has published a treatise on the projection of bodies, under this title.

B A L L I T O R E, in Geography, a small poft town in the county of Kildare, in the province of Leinster, in Ireland, pleasantly situated in a well planted valley on the banks of the river Greens, a little on the right of the great road from Dublin to the south. It was chiefly a settlement of Quakers, but the number of these has considerably decreased; and the active part taken by many of the inhabitants in the late rebellion, caused it to be in a great measure destroyed. The celebrated Edmund Burke received his early education in this town at the school of Mr. Abraham Shakleton, one of the respectable claves above-mentioned; which school was then held in high estimation, and has been continued by his descendants of the same name to the present day. Distance from Dublin 28 miles. N. lat. 53°. W. lang. 6° 51'.

B A L L I U M, or Bailey, in our ancient Military Tactics, was used to signify a certain plot of ground within a fortified place. The outer baillium was that which presented itself immediately on entering the outer gate of the castle, where we usually see a mount of earth to command some distant work of the besiegers. It was separated by a strong embattled wall and towered gate from the inner baillium, where were commonly the houses and barracks for the garrison, the chapel, stables, and hospital, and within which, or at one corner of it, in the early castles, surrounded by a ditch, stood the keep or dungeon, generally a large square tower, sometimes flanked at its angles with small turrets; this keep was to our old forts, what the citadel is to modern ones, the last retreat or redit of the garrison. (See Gore Hill, of the Eng. Army, ii. 3.) And here may be noticed, that the small remains of Oxford castle exhibit a remarkable instance of the double baillium; in the outer space stands the mound, and at no great distance from it (though without the castle precincts), the church of St. Peter in the Bailey; behind it a considerable distance flanks the ancient Norman keep, in the upper part of which, on the different sides, are round-head arches filled up with masonry, whence, as from the left retreat of the garrison, the besiegers, though in possession of the mound, might be annoyed. The Old Bailey, or outer space near Ludgate in the ancient fortification of London, has perhaps a similar etymology with St. Peter in the Bailey at Oxford.

B A L L O C K, in Geography, the name of rocks on the N. W. coast of the island of Hla.

B A L L O G I S T A N, a district of Hindostan, in the country of Delhi, bordering on the north of Mewat, and approaching by its eastern limit within twenty-four miles of Delhi. It is eighty or ninety miles long, and from thirty to forty broad. Within the present century, and more probably since the rapid decline of the Mughul empire, this territory was seized by the Balloges or Balochees, whose proper country adjoins to the western bank of the Indus, opposite to Multan. Some tribes of them are also found in Makran. They are represented as a most savage race, and appear to be very proper neighbours for the Mewatti. This territory is full of ravines, and difficult of access to invaders. It has, however, undergone the fate of its neighbours, and been successively tributary to the Rohilla chief, Nadib Dowlah; to the Iats; and Nudjaff Cawn. Westward, it borders on the Sikhs. Ren. Mem. Introd. p. 120.

B A L L O O N, in Geography, a town of France in the department of the Sarthe, and chief place of a canton, in the district of Le Mans; the place contains 3561 and the canton 15,598 inhabitants; the territory includes 162½ square kilometres and 16 communes.

B A L L O O N, in Architecture, is used for a round ball, or globe, placed at the top of a pillar, or the like, by way of acroter or crowning. That on the top of St. Peter's at Rome is of brass furnished by an iron arm within; and being at the height of sixty-seven fathoms, is above eight feet in diameter.

B A L L O O N, in Chemistry, Ballon Fr. is a large globular vessel, generally of glass, with a short neck, which is employed in a variety of chemical operations, particularly in receiving the products of distillation; in containing gasses for experiments in which heat or combustion is used; and for several other purposes. Frequently, it is made with more than one orifice. It is larger than the mattrais, has a shorter neck, and if heated on a sand bath, great care must be taken to do it gradually on account of the greater thickness of the glass. In making the glass-balloons, it is simply blown, without a burr at the bottom like the mattrais, whereas the receiver is generally fashioned at the neck, and therefore must have the same perfection at the bottom, unless it is afterwards ground off.

B A L L O O N, in French Commerce, denotes a quantity of paper, containing twenty-four reams.

B A L L O O N, Ballon, or Balle, signifies a certain quantity of glass-plates, greater or less according to their quality. The balloon of white glass contains twenty-five bundles, of six plates per bundle; but the balloon of coloured glass contains only of 12½ bundles, each bundle including three plates.

B A L L O O N also denotes a kind of game something resembling tennis.

The balloon is played in the open field, with a great round ball of double leather blown up with wind, and thus driven to and fro with the strength of a man's arm, fortified with a brace of wood.

B A L L O N, or Balloon, is more particularly used among Voyagers, for the late barges of Siam.

The balloons are a kind of brigantine, managed with oars, of very odd figures, as serpents, sea-horses, &c. but by their harpins and number of oars, of incredible swiftness. The balloons are said to be made of a single piece of timber, of uncommon length; they are raised high, and much decorated with carving at head and stern: some are gilt over, and carry 120, or even 150 rowers on each side. The oars are...
BALLS, in *Pneumatics*, a name lately given to an aeronautic machine, employed for the purpose of aerial navigation. See *Aerostation*.

BALLOON, in *Pyrotechny*. See *Balls, Fire-Works, and Pyrotechny*.

BALLOTA, in *Botany*, herbarium. Lin. g. 720. Schreb. p. 95. *Chamaedrys gymnocarpa*. Nat. Ord. *scarceae*, or *labiatae*. Gen. Char. *Cal*. perianth one-leaved, tubular, flaver-shaped, five-cornered, oblong, ten-squared, erect, permanent, equal; mouth acute, patent, plaited, five-toothed; involucre of linear leaflets under the whorls. *Cor*. monocarpous, ringent; tube cylindric, the length of the calyx; upper lip erect, ovate, entire, crenate, concave; lower trifid, obtuse; the middle segment emarginate, larger. *Stam.* filaments four, the two shorter subulate, bending towards the upper lip, and shorter than it; anthers oblong, lateral. *P. globosus*; fileiform; ligula slender, bushy. *P. albo-roseus*. Calyx unchallenged, foliaging the seeds in its bosom. *Seds* four, ovate.

Eff. Gen. Char. *Cal*. flaver-shaped, five-toothed, ten-squared. *Cor*. upper lip crenate, concave. It is observed that this genus has the involucrum of *Echinopodium*; the calyx of *marrubium*; and the corolla of *halesia*.

Species. 1. *B. nigra*, flaking or black herbarium. Smith. *Brit. Flora*. 625. Hudson 260. With 537. Eng. Bot. 46. "Leaves ovate, undivided, serrate, calyces dilated upwards, somewhat reticulated." A hairy plant with an acrid pungent smell; from two or three feet high, erect, bracted, covered with rounded hairs; leaves petioled, ovate, or subcordate, serrate; flowers numerous, in axillary whorls, pedunculated, leafy, braacted; bracts bristle-shaped, ciliate, half the length of the calyx; calyx tubular, hispid, ten-ribbed, plaited, or furrowed at the margin, obtusely five-lobed, reticulated with veins, teeth awned, spreading; corolla purple, the upper lip of which is emarginate, hairy, on the outside; the under three-lobed, beset with white veins. It is a perennial plant, common in waste places, and hedges, flowering in July. 2. *B. alba*, white flowered black herbarium. "Leaves cordate, undivided, serrate, calyces subtruncate." This Swedish plant has not yet been satisfactorily determined.

*Propagation and Culture.* The European sorts are never introduced into gardens. The third species is hardly, but the three last require the protection of a flove. They may all be increased by seeds. See Martyn's *Miller's Diet*.

BALLOTADE, or BALLOTADE, in the *Meany*, is a leap in which the horse seems as if he intended to kick out without doing it; he only offers or makes a half kick, sending only the shoes of his hind feet. Berenger farther observes, that the horses defined to these airs (croupades and balotades), ought to have a light and steady mouth, and an active and lively disposition, with clean nervous strength; for all the art and knowledge of the horseman cannot confer these qualities, which yet are essentially necessary to the perfection of this manege.

The croupades and balotades are different from curvetts, inasmuch as they are much higher behind, and consequently their time and measure not so quick and close, but flower and more extended; therefore, the rider should keep his horse's croup in air, by linking it from time to time with the foot, supporting him not quite so high before, and observing to sit with his legs, flower, and not so forward as in curvetts.

To manage the strength and vigour of the horse you intend to work upon the volts, in croupades and balotades, let the line of the volt be larger than for curvetts, and let the action of the shoulders be not quite so high; thus you will not only check and confine his activity and lightsfoot, but by raising his shoulders in a leg's degree, give liberty to his croup, and he will be enabled to furnish his air altogether, that is, before and behind better and with more ease; there is still another reason for this, when the shoulders come to the ground from too great a height, the fock alarms and disorders the mouth, and thus the horse losing the readines of his appay, he never will raise his croupe so high as he ought to make perfect balotades.

BALLOVING, a method of voting at elections, i.e., by means of little balls, which are usually of different colours, by the French called *ballotes*; which are put into a box privately.

BALITOWN, in Geography, a township of America, in Saratoga county, New York, formerly in Albany county, contained in the year 1790, 7333 inhabitants, including sixty-nine slaves. By the last census in 1796, there appear to be 266 electors in this township. It lies 36 miles N. from Albany, has a Presbyterian meeting-houfe, and is in a thriving state. The medicinal waters called "Baltown Springs," from their being situated within the limits of this town, have acquired celebrity on account of their salutary virtue, and the accommodations adjoining to them for consummaturians. The springs are found in the bottom of a valley, or excavation, forming a kind of basin, and comprehending in their extent about fifty acres. In the vicinity of the springs are several neat bathing-houses, and shower baths, for the convenience
which mentioned the building, has remarkable circumstance, must and as gives large features and particular. The Hamilton's pendant of PalTeri, another, as supplied from Fairhead, the opposite, and overhangs the sea; as observed, that it is plainly the Teutonic balustrade, an inclosure.

BALLCASTLE, a sea-port town, in the northern part of the county of Antrim, province of Ulster, Ireland, situated on the west of Fairhead, near the mouth of the little river Glenhella, and opposite to the island of Ragherly. Between this town and Fairhead are valuable collieries, in an abrupt bank which overhangs the sea; a circumstance, however, from which little advantage can be derived, as the unsheltered situation of the place, and the prevailing weary winds make a delay on the coast extremely dangerous, and render it difficult to embark the coals. As the want of capital has always been an impediment to such undertakings in Ireland, application was made to the legislature, on the discovery of the mine in 1721, for aid to work it; and 6000 pounds were granted for this purpose, as well as the large sum of 23,000L at different times for making a harbour there, and building a pier to protect it; which expense was incurred in the hope that Dublin would be a great market supplied from this colliery, and thus be rendered less dependent on the proprietors of the Cumberland mines. The pier, however, has been washed away, and the harbour so choked up with sand, that like many other publick grants in Ireland, it has been productive of little or no national benefit. By the exertions of an individual, some years ago, much coal was procured, and several manufactories were established in the town, but since his death the latter have been neglected. The collieries, however, continue to be worked, and from the last account seem to be productive, though not to the degree that was expected. The coal is laid to resemble the Scotch coal, but does not burn so well. The different foils commonly situated above it are iron-foil, black shiverly slate, grey, brown, or yellowish sand-foil, and whin-foil. The accidental discovery of an old mine in 1770, which was very extensive, and was found to be a complete gallery, branching into numerous chambers, which were drenched in a workmanlike manner, and must have been wrought by persons at least as expert in the business as the present generation, has furnished Mr. Hamilton with an argument in favour of the ancient civilization of Ireland. As no coal mine at this place is mentioned either by Boate, or by his William Petty, the latter of whom visited Ballycastle between 1660 and 1670, and is particular in his account of it; as for many centuries previous to the reign of James I., a work of this nature was not likely to have been carried on; as the cinders of fossil-coal are visible in the cement with which a caisle of great antiquity in the adjoining isle of Raggery was built; and as the tradition of the natives refers it to a very early period, he concludes that it must have been worked previously to the eighth century. This opinion seems to be strengthened by Mr. Whitaker's reasons for supposing fossil-coal to have been known to the ancient Britons. Mr. Ledwich, on the other hand, affirms, on the authority of Lombard, that coal was not discovered and used in Ireland long before A D. 1632. Near Ballycastle are two mineral springs, one of them vitriolic, and the other chalybeate. Distance from Dublin 113 Irish miles. N. Lat. 55° 17'. W. long. 6°. Hamilton's Letters on Antrim. Statutes of Ireland. Latoncave's Rambles. Ledwich's Antiquities. Beaufort's Memoirs. Rutty on Mineral Waters.

BALLYCLARE, a poll and fair town in the county of Antrim, province of Ulster, Ireland, ninety-five miles north of Dublin.

BALLYCONNEOLL, a small market and poll town of the county of Cavan, Ireland, situate sixty-seven Irish miles north-west from Dublin, on the borders of a wild and mountainous district. The peatlands are hardy and industrious, yet bitters to much depravation for want of encouragement. The women spin a good deal of wool as well as flax, and frizes are made for home use; but every thing is very narrow and contracted scale. Agriculture has lately improved, and the culture of wheat has been increased by the establishment of a good flour-mill; and there is also an excellent bleach-green near the town. The mineral treasures of this neighbourhood are, however, the most valuable. Coal is found in the adjoining mountain of Slieve-Russell, and generally dug up the side of the hill, in blocks, near the surface. No attention to this valuable concern has yet actuated the proprietors on whose estates this mineral is found in such abundance, and so easily raised. In the mountain of Ormeadillagh, both silver and lead ore are carried down the stream which flows from it. Besides these, pure sulphur is frequently found; and fuller's earth is in abundance. There is much pipe-clay also, which is found very soft, and when baked in the sun acquires a proper consistence.

BALLYCOTTON, a village on the sea-coast of the county of Cork, province of Munster, Ireland, inhabited by fishermen, and frequented for sea-bathing. It is four miles from Cloyne, and has some ruins in the neighbourhood. It gives name to a large but dangerous bay, nearly semi-circular, which is remarkable for abundance of
B A L

fine flat fish and lobsters, which are chiefly sent to Cork. There is a small island of the same name, which forms one extremity of the bay, and is almost covered, in the season, with the nets and eggs of various sea-fowl, especially puffins.

N. lat. 51° 56'. W. long. 7° 59'.

BALLYDONEGAN, a bay on the south coast of Ireland, in the county of Cork, on the south side of the entrance into Kenmare river. It has an open entrance, with a good depth of water and anchorage.

BALLYFUL, a bay in the Atlantic ocean, on the west coast of Ireland, twelve miles south-east of South Arran islands. N. lat. 52° 53'. W. long. 9° 20'. See Ballyfe.

BALLYGELLY HEAD, a cape on the east coast of Ireland, in the Irish sea. N. lat. 5° 34'. W. long. 5° 44'.

BALLYHAVEN, in Geography, lies within the entrance of Strangford haven, on the east coast of Ireland, beyond Port Ferry on the east side.

BALLYHAUNIS, a post-town, or rather village, in the county of Mayo, province of Connaught, Ireland, where are the ruins of a monastery; 100 Irish miles north-west of Dublin.

BALLYHAYES, a small town of the county of Cavan in Ireland, which has an improving market, and mills for flour and oatmeal. The market-day and the ring of the old town are arched, and built of brick. These antique and fantastical buildings shew it to have been once a place of considerable note, being remarkably furnished with all the old-fashioned ornaments to which the lords of this county were particularly attached. This town and the adjoining demesne have suffered much from a long dispute respecting the possession. Distance from Dublin 57 Irish miles north-west.

BALLYKAIA, an island on the north-west side of the sea of Azof, and near the northern extremity of it. N. lat. 46° 38'. E. long. 56° 18'.

BALLYLANY, a small island in the Atlantic ocean, near the west coast of Ireland. N. lat. 53° 23'. W. long. 10° 16'.

BALLYEIGHHEAD, or Kerry-head, the fourth point of the entrance of Shannon river.

BALLYNESS BAY, a small harbour on the north-west coast of Ireland, towards the western point, having Dunfine head for its carfia limit, and directly west from Shigo bay, and east from Broad haven.

BALLYMACHUS POINT, the western point of the entrance into Oyler-haven, without the carfia point of the entrance into Kinlafie harbour, on the south-east coast of Ireland.

BALLYMEHON, a market and post-town in the county of Longford, province of Leinster, Ireland, 53 Irish miles north-west of Dublin.

BALLYMENAI, a town of Ireland, in the county of Antrim; ten miles north of Antrim.

BALLYNAMORE, a post-town in the county of Galway, province of Connaught, Ireland, eighty-five Irish miles west of Dublin.

BALLYQUINTON POINT, a cape on the south of the county of Down in Ireland, in the Irish sea, at the eait of the entrance into Strangford lough; seven miles east of Downpatrick. N. lat. 54° 15'. W. long. 5° 20'.

BALLYNERAY CAPE, lies north-east of Ballykais island in the sea of Azof, on a peninsula. N. lat. 46° 50'. E. long. 56° 48'. It is also called Kofia Birda Sarai Kaim.

BALLYSHANNON, a town of the county of Donegal, in the province of Ulter, Ireland, situated on the river Erne, which discharges the waters of Lough Erne into the bay of Donegal, at the distance of about three miles from the sea. It is the principal town in the county, and was formerly of some consequence as a fortified place, though it presents its importance chiefly from its salmon fishery. The harbour is a barred one, but at high water is navigable for vessels of 40 or 50 tons burden up to the waterfall, where is safe anchorage for a great deal of shipping; but the bar is for some hundreds of yards so exposed to southerly storms, as to render it quite inaccessible during high winds. The salmon leap, which is near the town, has a very beautiful appearance; the fall is down a ridge of rocks about twelve feet high, and at low water forms a very picturesque object. It is one of the principal salmon leaps in Ireland, and when last rented was let for near 1100£. It has during the two last years (1802) been much more productive. There is also an eel fishery, which fails at 325l. 10s. 6d. yearly. Before the fall, in the middle of the river, is a rocky island, on which is a curving-house, instead of the turret of a ruined castle for which it seems formed. The coast of the river is very bold, consisting of perpendicular rocks with gulls of a beautiful white colour to the very edge; it projects in little promontories which grow longer as they approach the sea, and open to give a fine view of the ocean. The town is prettily situated on the rising ground on each side of the river, over which there is a bridge of fourteen arches. It has improved much within a few years, and is acquiring some degree of importance in trade, which would increase much more if a strong wall was built to shelter the entrance of the harbour. The completion of the canal which has been undertaken to join Lough Erne to the sea at Ballyhannon, would also be of material service to it. Near the town, the Rt. Hon. Thomas Conolly has established a linen manufactury, viz. twenty houses with two looms in each house, and a certain portion of land annexed to it. The Tyrhugh Farmers Society has also offered premiums for establishing a linen market at Ballyhannon. A little north of the town of Ballyhannon, on Mr. Conolly's estate, is a large bank of yellow pyrites. This town was made a corporation in 1611, and lent two members to parliament; but this privilege has been discontinued since the union. Its distance from Dublin is 101 Irish miles. Longitude 8° 2' west of Greenwich, latitude 54° 31' N. Young's Tour. Boate, Dr. Beaufort. McFarlane's Stat. Account of Donegal.

BALLYTHEIGH BAY lies round the east point of the entrance into Bannoe or Bannow bay. (See Bannow.) At the fourth end is a small island called Inch island.

BALLYVAGHAN, a bay on the westem coast of Ireland, and north part of the county of Clare, in the south part of Galway bay.

BALLYVAR, a poft and fair town in the county of Mayo, province of Connaught, Ireland, 135 Irish miles north-west of Dublin.

BALLYWATER, the mouth of the entrance into Carrickfergus bay, on the north-east coast of Ireland, and the opening of Belfast river. The name is sometimes given to the sea southward along the east coast of the peninsula, of which Stangford lough, or lake, is the west side.

BALM, in Botany. See Melissa.

Balm of Gilead. See Dragonfolium.

Balm of Balsam. See Balsam.

Balm, in Geography, a town of Germany, in the circle of Upper Saxony, and Hinder Pomerania, 17 miles S.W. of Stargard, and 17 south of Old Stettin. N. lat. 53° 8'. E. long. 14° 48'.

BALMAHA,
BALMALA, a town of Africa, in the desert of Bar-
des.

BALMAMAT, a town of Asiatic Turkey, twelve
miles west of Kavadar.

BALKMARINO, in the county of Fife, in Scotland, is
the name of a parish within whose limits is a small ham-
bou, and the remains of an abbey which bears the name of
the parish. From the former a considerable quantity of
grain is annually exported, and a salmon fishery is esta-
blished near this place in the firth of Tay. The abbey of
Balkmarino, which was founded in 1299, for monks of the
Cistercian order, has been a magnificent and extensive pile
of building; but its grandeur is nearly annihilated, and only
a few fragments remain to mark its site and character.
It is about two miles to the east of Perth.

BALMING. See Embalming.

BALMUCCA, a town of Piedmont, in the valley of
Sestia, seven miles west of Varallo.

BALTAVES, Henry, in Biography, a Scots Protestant
divine, was born in the shire of Fife in the reign of James
V., and educated in the university of St. Andrews. He fi-
milies his studies in France; and on his return to Scotland,
was admitted to the family of the earl of Arran, but dis-
mused in 1544, for embracing the Protestant religion.
Having joined in the murderers of cardinal Baxton in 1544,
he was condemned to exile, and excommunicated. During the siege
of St. Andrews, he was sent by his party to England, and
returned with a considerable supply of provisions and money;
but being compelled to surrender to the French, he was
sent with the rest of the garrison to France. After his re-
turn to Scotland, about the year 1559, he was appointed
one of the commissioners to treat with the duke of Norfolk
on the part of queen Elizabeth. In 1565, he was made
one of the lords of session; and appointed, with other
learned men, to revise the book of discipline. Knox, who
who was his fellow-labourer, gives him the character of a very
learned and pious divine. He died at Edinburgh in 1579.
His writings are "A Treatise concerning Justification," and

BALNEARIUS FAVI, in Antiquity, servants or attend-
ants belonging to the baths.

Some were appointed to heat them, called fornicatori;
others were denominated caparisi, who kept the clothes of
those that went in them; others aliptes, whose care it was
to pull off the hair; others anticlaris, who anointed and perfumed
the body.

His writings are "A Treatise concerning Justification," and

BALNEARIUS FAVI, a kind of thief who practiced
stealing the clothes of perfons in the baths; sometimes also
called fur balcanum.

The crime of those thieves was a kind of sacrilege; for
the hot baths were sacred: hence they were more severly
punished than common thieves, who fled out of private
houses. The latter were acquitted with paying double the
value of the thing stolen; whereas the former were pun-
mished with death.

BALNEUM, in Chemistry. See Bath.

BALNIA, Caio, in Geography, Balnez, or White
Cape, a small white cliff, about five leagues from cape Paf-
fado, nearly under the equator, on the coast of Peru, in
South America.

BALOG, a town of Hungary, twenty miles east of
Arad.

BALOHA, a town of Africa, on the river Grand, in-
habited by the descendants of a mixture of Portuguese and
Africans.

BALONGO, three islands in the bay of Bengal, near
the coast of Assam. N. lat. 19 50' 20' 5'; E. long.
93° 10' 93° 20'.

BALKONICH, in the Materia Medica of the ancients, a
name given by Avicenna, Acrabesh, and others, to a kind
of camphor, which they describe as coarse, brown, and of
a less value than the other sorts. This is probably the same
with our rough camphor, as brought over to us from the
East Indies.

BALONTE, in Geography, a people of Africa, who in-
habit the banks of the river Gaves, the channel of which di-
vides Bifo from the main land. Their territory is about
twelve leagues in length, and about as much in breadth.
The Balontes maintain no intercourse with the neighbouring
natives; either on the continent or islands; and though
they sometimes travel beyond their own limits, they will
not permit any foreign negroes to pass their frontiers. Their
religion is idolatrous, and their form of government an arbi-
tracy. They allow of no slavery; they are bold, intrepid,
and warlike; but crafty, treacherous, and fraudulent.
Their arms are affagayes, arrows, and sabres. The Bal-
ontes are suppos'd to have gold mines in their country; and
under this idea the Portugueze assembled a large body of
troops at Bifo in 1695, and invaded the country. But
the rain of the season rendered their arms and ammunition
useless; and the Balontes attacked them with this disad-
antage so vigorously, with their affagayes and sabers, as
soon to rout them and force them to retire with a con-
derable loss of men, and of all their ammunition and florins.

BALOU, a town of Asia, in Armenia, twenty-five miles
northwest of Cars.

BALQUHIDDER is a parish in Perthshire, in the
highlands of Scotland, and is noted for its mountainous
scenery. Some of the mountains are very high and steep;
and among them, those of Benmore and Beauford are the
most lofty and conspicuous; the fir trees rising to the height of
3003 feet above the level of the sea, and the latter to
that of 3300 feet. In this parish is a considerable extent of
the ancient Caledonian forest; but it is annually abridged
by the inclining system, which has at length found its way
into these northern regions. Here are also several lakes
or lochs, of which the principal are those of Lochdine,
Lochvole, part of Lochlubuaig, and part of Lochearn.
The military road from Stirling to Fort William passes
through this parish. The great inequality of ground pre-
vents the farmers from appropriating any of their lands
to arable; and the pastures on the sides of the hills is
chiefly fed by sheep.

BALS, a river of Greenland, which runs into the sea.
N. lat. 64° 30'; W. long. 50° 10'.

BALS, in Ancient Geography, Tavira, a town of His-
pania, in Lucania; belonging, according to Ptolemy, to
the Turdetani. It was in the part called Cuneus, near the
sea, and not far from Anus to the west.—Alfo, a burgh
of the interior of Africa, reckoned by Pliny among the
conquests of Cornelius Balbus.

BALSAM, in Chemistry and Medicine, βαλσαμος. Gr.;
baljum, baljaum. Lat.; besam, Fr. Various meanings
have been affixed to this term, which it is of some impor-
tance to dilinegual, as the chief of natural baljsms have been
described from the earliest ages as sort of the most valuable
productions of the vegetable kingdom, have formed the
most precious articles of commerce in the East; and have
been used for medicinal purposes, and about the human
body, as long as the art of medicine and the practice of adorning
the person have been cultivated.

The term baljs appears to have been originally confined
3 X 2
to a certain fragrant viscid juice exuding from a tree in Arabia and Egypt, and now denominated the balm of Mecca, or Opobalsamum. Hence it was extended to other productions of the same nature; and we may define the true meaning of a balm to be a fragrant, oily, viscid, inflammable juice, exuding from various trees and plants, not soluble in water, incapable of putrefaction, and possessed of the power of preventing animal nature from spontaneous change for a considerable length of time. This latter property has given rise to the term embalming or balsamization of bodies, so universally practiced among the Egyptians.

Balsams are generally more or less acid to the taste, particularly after having been for some time chewed in the mouth. They have the strongest affinity to Resins, from which they seem to differ only in containing a larger proportion of essential oil, so that if any of the liquid balsams (turpentine for example) be distilled per se with a gentle heat, an oil rises in considerable quantity, and the residuum is a substance now dry and brittle, scarcely in any respect different from a resin.

Of late years a distinction has been made, and admitted into the French nomenclature, between balsams and resins, in the circumstances of the former containing a portion of the Benzol acid, which considerably adds to the penetrating fragrance of these substances, especially when warmed, and may be expelled from them by a gentle heat. This distinction was proposed by Bucquet, and has since been very generally adopted. We cannot however allow of its propriety, since it would confine the term to a very small number of substances, even to the exclusion of the original balm of Mecca and many others to which the term has long been appropriated; and it would extend to the solid and brittle gum benzoin contrary to the quality of unitaediae or vifidity which has always been considered as essential to a balm, so much that even the solution of sulphur in oil has on this account been termed a balm.

Balsams are natural or artificial. The latter are compositions exclusively belonging to pharmacy, and generally composed of essential oils, resins, and aromatics brought to the confidence of a balm, sometimes by oil, sometimes by ardent spirit. These preparations are so numerous and complex, that we shall only mention a few of the most celebrated; but first we shall notice the natural.

§ 1. Natural Balsams.

Balsamum Mecca.—B. Opobalsamum.—B. Gilandafe.—B. Judasim.—B. Syriacum.—The genuine opbalsam or balm of Mecca.

This celebrated balm has preferred almost from time immemorial the high value in which it has been invariably held by the civilized nations. This indeed is partly owing to the exclusive spirit of oriental depohtism, which prevents this precious drug from entering the common markets; so that all our knowledge of its properties is derived either from report, or from the rare opportunities which individuals have enjoyed of possessing a specimen of it.

The tree that yields it is the Amris, of which there appear to be several species, all of them fragrant and balsamic. It is commonly obtained by incisions; the opbalsamum being prepared from the wood, and the carpobalsamum from the fruit. It is chiefly cultivated in Arabia, in the interior of the country, between Mecca and Medina. According to Bruce, when fresh from the tree, the balm is of a light yellow colour, a little turbid. It presently grows clear and yellow like honey, which deepens by age. Its smell is exquisitely fragrant and very pungent, giving a sensation like that of volatile fumes. This remains for years if the balm is kept carefully corked. The taste is bitter, acid, aromatic, and astringent.

The quantity yielded by one tree is very small, seldom more than about a dram daily, which alone must render it an expensive article; but in all probability it might be obtained without much difficulty by European planters, if it was likely to repay the expense. On pouring a drop of this balm on a glass of cold water, it spreads itself over the surface in a thin pellicle, which may afterwards be taken off by a pin, whilst the water becomes strongly impregnated with the scent and flavour of the balm. This is generally mentioned as a test of the genuineness of this article, but it is entirely fallacious, for when long kept the true balm will not exhibit this appearance, and many of the other thin balsams will show it with as much ease as the opobalsamum. When rubbed with water it becomes milky, and is resolved into a mass resembling hard in appearance. On adding more water it separates altogether, and floats at the top. Spirit of wine highly rectified divolves this balm without much difficulty; on adding water, the whole becomes milky. It is also soluble in the expressed and the essential oils. If a solution in olive oil is mixed with water very gradually, it forms a kind of pomade.

This costly balm is in the highest esteem among the Turks and other Eastern nations both as a medicine and a cosmetic. The Turks take it in the dose of a few drops to fortify the blood and excite the animal powers; externally it is used as a vulnerary. It may readily be imagined that the oriental spirit of exaggeration should have extolled the superior virtues of this admired balm; but fair experiments on its medicinal properties are still wanting; nor is it probable that it would be found to exceed the other balsams in this respect, so much as it does in fragrance and scent. The Mecca balm is also employed at Constantinople as a cosmetic in the fergalbo, according to the testimony of lady Wortley Montague. Under what form it is used does not appear, but its acrimony is such as to irritate the skin very considerably when rubbed on the face unmixed, as the fame eminent lady experienced on her own person. It is scarcely necessary to add that the substance sometimes foil in the shops for balm of Mecca, and at no great price, must be a mixed and adulterated compound in no degree to be depended on as the true opobalsamum.

The dried berries of this tree were formerly kept in the floors, and sold, as well as the balm, carbonbalsamum; and the dried twigs, xylobalsamum.

Balsamum Coparnum.—B. Copalize.—B. Brasilense.—Copalum or Coprini Balmum.

This balm, one of the most active and valuable for medicine, is obtained from the Copalifera officinalis, Linnaeus a tall and elegant tree growing in Brazil and several other parts of South America. To procure it, several incisions or sometimes a groove is made near the ground penetrating through the bark into the fulness of the wood, when the balm flows out in such abundance, that sometimes in three hours twelve pounds have been obtained.

This balm is colourless when flowing from the tree; after a while it becomes an amber yellow, and considerably viscid, but retains its transparency; it is never known to become perfectly solid. The smell of copri balm is fragrant and powerful; to the taste it is bitterish, heating, aromatic, and permanent on the tongue; it rhymes paper as oil does. It is nearly insoluble in water; but on being long rubbed with it, a kind of milky emulsion is produced, from which however the balm soon separates and rises to the top. It is readily soluble in fixed and volatile oils, and in
The spirit of wine: the latter makes a very strong penetrating tincture. Dilution readily separates the balsam into an oil which has all the volatile properties of the capivi, and into an aqueous part. If carefully distilled with water, from a fifth to half the weight of oil is obtained, which is slightly fragrant and nearly colorless. The residue is a resin, at first green, afterwards growing yellow, and brittle, soluble in alcohol, but not in water. The water with which the balsam has been distilled becomes slightly impregnated with the odour and flavour of the capivi. Diluted per 5, or mixed with water and subjected to a strong heat, the oil which rises at first fragrant and clear, afterwards bluish, thick, empyreumatic, but not unpleasant to the smell.

The capivi balsam is unquestionably an active substance when taken into the stomach; and its medicinal virtues, though perhaps over-rated, are however very considerable. Like turpentine, it determines powerfully to the kidneys, and impregnates the urine with its qualities, and has therefore been supposed to cure diseases of these organs. As its effluvia, however, are heating and rectifying, it is capable of producing much mischief as well as good, and its use is now chiefly confined to the cure of gleet and gonorrhoea. It is also serviceable in certain states of hemorrhois and diseases of the rectum, a fact which may well be credited, when it is considered of what acrid materials the celebrated Ward's paste is composed. In pulmonary affections it has been used fricte as a vulnerary or balsam, but it is too apt to produce or increase the general fever, and can seldom be employed with safety in these cases. The usual dose of this balsam is about twenty drops, but it is so viscid that this method of division cannot be adopted till it is warmed. The best form of exhibition is triturated with yolk of egg, almonds or mushilage, and thus united with water into an emulsion. This balsam is easily diffused with the thinner turpentine or with oils, and the detection of this fraud is often difficult on account of the potency of the smell and taste of the capivi, which covers almost every other.

Balfam Peruvianum exudes from a large tree growing in Peru, Mexico, Brasil, and other parts of America. See Druoxylon Peruvianum.

There are two species of the Peruvian balsam, the white and the brown: the white balsam is very rarely met with in the shops. It is procured by incision of the bark, but very sparingly, and it soon concretifies into a fragment brittle resin, which is brought over in gourd shells. It is also called the white syrop. It is less hot and more fragrant than the black balsam, and more approaches to the properties of syrop.

The common Peruvian balsam is of a dark colour approaching to black; the smell highly fragrant; the taste aromatic, rather bitter, and considererably acid; the confidence always thick and viscid. Dropt into water, it sinks to the bottom, and refines to mix with it: but by agitation gives it a fragrant smell and somewhat of the sensible properties of the balsam. It dissolves readily in spirit of wine. When mixed with the fixed oils and heated, it is decomposed; its essential oily ingredient, which gave it fluidity, is absorbed by the expressed oil, and a thick tenacious resin remains, which gradually becomes solid in the air. In this insolubility in fixed oils it remarkably differs from the other balsams, nor does it readily mingle with the other balsams. Diluted with water, it gives about a sixteenth of an essential fragrant reddish oil, very sparingly soluble in alcohol. Dilution per 5 gives a similar oil, but empyreumatic, by regulated heat a small quantity of benzoic acid may be sublimed out of this balsam.

Peruvian balsam is one of the most stimulant of all this species of substancess, and is therefore applied with advantage in several diseases. It is also particularly recommended as an external application, where a warm stimulant is required. A tincture is made by distilling the Toluiferia (Tinctura balsami Peruvian, Ph. Linn.), and it enters into several of the artificial or compound balsamic preparations. The dose of this balsam is from two to twelve grains, and it may be given in the form of an emulsion mixed with water through the medium of yolks of egg. Aloeic and warm cordial pills are conveniently made up with this balsam, and their virtue is somewhat increased by it.

Beauv. asserts that it is sometimes purified by the second oil that rises from gum benzoic in distillation, cajetted upon poplar boughs, which have a light terebinthous odour, and afterwards mixed with a little of the true balsam. The comparatively low price of the genuine balsam, however, would seem to render this fabrication scarcely worth the trouble. "Balfam Peruvianum Tolutani," a tree which grows in the province of Tolui, in Spanish America, behind Carthagena. The balsam is obtained by making incisions on the bark of the tree, and is brought over in small gourd shells. This balsam is of a reddish yellow colour, and pellucid; its confidence when fresh is extremely tenacious, but by age it becomes brittle; but in hot weather, pieces of this balsam generally coalesce and adhere to the bottom of any vessel in which it is kept. The smell of this balsam is extremely fragrant and grateful: it has but little taste; when chewed, it sticks to the teeth, and appears almost insoluble in the saliva, but gives a gentle aromatic warmth to the tongue. The Tolui balsam is one of those that contain a notable proportion of the benzoic acid, and is therefore fricte a balsam according to the modern acceptation, and probably owing to the presence of this acid, it readily imparts its flavour to watery liquids, though it appears to be scarcely at all soluble in this fluid. Eight ounces of this balsam boiled for two hours in a close vessel in three pints of water make a very fragrant decoction, which, when mixed with the requisite quantity of sugar, forms the perfura Tolutuni, Ph. Linn. In the Edin-burgh Pharmacopoea, the syrup is formed by the admixture of two pounds of simple syrup recently prepared and not yet cold, with one ounce of the tincture of Tolui.

This balsam is perfectly soluble in spirit of wine. The tinctura Tolutani, Ph. Ed. and tinctura balsami Tolutani Ph. Linn. are prepared by distilling an ounce and a half of Tolui balsam in a pint of rectified spirit of wine. It is easily soluble in the essential oils, but with difficulty in the fixed. By distillation per 5, the sublimed benzoic acid is first given out in a very gentle heat, together with a fragrant empyreumatic oil. On account of the benzoic acid, this balsam burns with a remarkably aromatic penetrating smoke; and was often an ingredient in those fumigations which were formerly so much employed either with a view of purifying an infected atmosphere, or for diffusing a grateful scent. When taken medicinally, either the tincture is employed, or the balsam is united with water by egg or mucilage. Its powers are gently stimulating; but it appears altogether a trailing article of the Materi Medica, except on account of its odour. It is given with more security in pulmonary complaints than the other balsams; and it appears to have some effect in checking or diminishing the excessively offensive fumes of the breath of persons suffering under ulceration of the lungs.

Balfamum
Balfumum Ratiafa is a balm described by Murray (App. Med.), which Spielman relates to be brought from India. In confidence, and other flable properties, it much resembles the Tolu balm, but appears to be weaker. Its origin is unknown, and it is supposed to be fictitious. It is seldom seen, and never used.

Balfumum Carpathicurn, Carpathian or Hungarian balm, Krumbhobenzum, Ger.; called also balfumum Libani. This fine balm is procured from the pineus Mugho and the pineus Ambra, which grow abundantly on the Carpathian mountains, the Tyrol, and many parts of Hungary, Germany, and Switzerland. The balm is esteemed by the common people as a foreign remedy for almost every disorder, external and internal. The Olicum Tempurium, or Krumbhobenzum, is an oil of turpentine prepared by distilling this balm, and is in equal repute. For a further description of this and all of the turpentines, which are truly and properly balms in the usual meaning of the term, see the articles Pinus, and Turpentum, particularly the latter, under which we mean to include most of the resins products of the different species of fir.

Balfumum Canadiane, a very fine fragrant and powerful Turpentine, procured from the Pinus balfumum, the Virginian or Canada fir.

Balfumum Styax, Roxor, or liquid amber. See StyraX.

§ 2. Artificial Balmum.

These are preparations of the Materia Medica formerly in much repute, and compounded of a vast variety of resiny and aromatic drugs, the whole brought to a strong confidence, so as to resemble the natural balms. They are but little employed at present. Any preparation in which oil was so thickened as to be brought to a treacle confidence, was termed, in the older Pharmacopoeias, a balm, and many of these species were equally used as external and internal applications. We shall only mention a few of these preparations.

Balfumum Loretalli.—Of the former London and Edin-

burgh Pharmacopoeias. In the former, it was prepared by melting half a pound of yellow wax with about half a pint of oil, the remainder another half pint of oil, with half a pound of Strauburg turpentine, and when nearly cold, stirring in six drams of red saunders wood to colour the whole. In the latter, instead of the red saunders, balmum of Peru and powdered dragon's blood were added to the melted wax, oil, and turpentine. Another variety of this preparation used in the Paris Pharmacopoeia, is to employ wax, olive oil, white wine (which was evaporated off the wax and oil), turpentine, saunders wood, and Peruvian balmum.

Balfumum Commendat in, Baume de Commandeur.—Balm

of Roxor.—Watt's Balmum.—Jeftine Drops, or Friar's Balmum. Under all these appellations, and with some variation in the ingredients, was this celebrated balmum known and prepared. In the Paris receipt, a tincture is first made of angelica root and the flowers of hypericum in Spirit of wine; in this are diffolved myrrh, aloes, cinnabaumaloe, horax, benzoia, Peruvian balmum, and ambergis. The whole makes a thick, fragrant, and highly stimulating liquid; which is used either internally as a cordial and supported vulnerary, or externally to promote the evacuation of wounds. A judicious reform of this balm is retained by the London and Edinburgh colleges, under the name of—

Balfumum Traumaticum, or Inflata Ruscum Composita. This is prepared by diffusing three ounces of benzoin, two ounces of Roxor, one ounce of balmum of Tolu, and half an ounce of aloes, in two pints of rectified spirit of wine. The Edinburgh college omits the florax.

Balfumum Vio, Bebeun de Vio. This powerful medicine was prepared by Hoffman, under which name it went. It consists of a solution of several effential oils, and a small portion of Peruvian balmum, highly rectified spirit of wine. It is extremely fragrant and stimulating, and is employed almost entirely as an internal medicine in languages, fits, violent colic, and other cases that require a sudden and powerful stimulant. The ingredients in the Brandenburg pharmacopeia, adopted as an improvement of Hoffman's balmum of life, are the effential oils of lavender, nutmegs, cloves, rhodium, wild thyme, cinnamon, lemon, bergamot, and balmum of Peru, dissolved in spirit of lavender. The present laudable custom of simplifying the pharmaceutical preparations, would probably diminish the number of these effential oils which appears to be quite arbitrary.

A mixture of eight ounces of vitriolic acid and two ounces of olive oil forms the—

Balfumum Arsuriicurn, a very powerful external application, in which the volatile power of the vitriolic is moderated, but it requires to be used with great caution. In preparing it, the acid must be added very gradually to the oil with constant agitation, otherwise part of the oil will be charred and reduced to a hard black mass. When well prepared, it is of a very dark brown colour, and an uniform balmsic confidence.

The list of the artificial balms of which we shall mention, are the combinations of sulphur with oil.

Balfumum Sulpharius, or Olicum Sulphatum; Ph. Lond., and Edin. prepared by melting in an iron pot flowers of sulphur, with four, or with eight times the weight of olive oil.

The result is a thick, fetid, tenacious balmum.

Petroleum Sulphuratum is prepared the same way, only with the use of petroleum, instead of oil.

Balfumum Sulpharum Terchinhianum, B.S. Aritosum, which are now nearly diffused, were prepared by digelling the sulphur in oil of turpentine, in glasses sealed on a fixed heat, and in the latter cafe, also adding oil of anise feed. Oil of turpentine readily dissolves the sulphur, and with vehement force when in quantities, so that this preparation should be made in a very large manner. All the sulphur balms differ from the other balms, in having a very offensive smell and taste. They are hot and irritating, and their internal use is very limited. Externally, the thick sulphur balm is used in farriery.

Balsam Append, Male, in Botany. See Momordica.

Balsam Brev, in Geography, lies on the west side of Old Cape Frances, and on the north side of the island of Hfipam, or St. Domingo, in the West Indies. N. lat. 19° 42'. W. long. 66° 35'. See Baume.

Balsamation. See Embalming.

Balsamalcum, in the Materia Medica, a name given by some authors to the balm of Gilead, or true balmsic Judicium.

Balsamics, in Medicine. Before we conclude the article of balms, it may be proper to make a few observations on their use in medicine. Of the properties which have been attributed to the internal use of all balms, none is more ancient, and commonly prevalent than that of heating or vulnerary. This idea appears to have arisen from the observations of their use, when externally applied to a recent wound. If a gash is made in the hand with a clean cutting knife, and the parts are brought together and bound up with a rag dipped in any balmum, and left undisturbed for some days,
it is a matter of common remark, that the wound will generally heal without any suppuration, by simple union of the divided parts. However, it is highly probable that the balsam acts, in this case, principally as a cement to keep the divided lips in more complete re-union, and to exclude the external air; for the same application to the surface of an open lacerated wound, is known by every surgeon frequently to bring about complete and perfect union, and never in the danger of any extensive suppuration or gangrene. The natural balsams are more mild than others, but all have a certain degree of acrimony, which renders their indiscriminate use in injuries of the body extremely hazardous; though under due management they may be of essential service. But scarcely a single circumstance which recommends their external use, can apply to internal ulceration or rupture of vessels. The healing power depends chiefly on the mode of application, the degree of topical stimuli, and probably the exclusion of external air; and hence, the value which has been set on balsams as internal vulneraries is entirely lost. A languid indolent ulcer in the kidney might perhaps be assisted by local fumulating remedies, but when the remedy must act on the humor or humour itself, the vessels must be made to take with and diluted by the common circulating fluid, the remedy is no longer local, and the irritation which it produces, is either counteracted during the circulation, or is equally diffused over the whole system. Balsams, therefore, though they be by no means to be despised, are no longer viewed with that degree of partiality which the older physicians entertained for them, and repeated experience has shown them to be sometimes absolutely useless, and often positively detrimental in internal ulceration of the kidneys, kidney, or other discharges for which they have been long celebrated.

BALSAMINA, or Balsam, in Botany. See Impatiens.

BALSAMITA. See Achilles, Chrysanthemum, and Tanacetum.

Balsamita, in Materia Medica. See Tanacetum.

Balsamita, in Entomology, a species of Aphis, that feeds on the tanacetum balsam. Müll. Zool. Dan.—The general colour is black; abdomen green; eyes red.

Balsamon, Theodore, in Biography, an eminent master of the canon law, flourished in the Greek church towards the close of the twelfth century. He was appointed guardian of the laws and records, i.e. Nomophylax and Charetophylax, of the church of Constantinople; and he was nominated by the Greek church to the patriarchate of Antioch; but this see being feigned by the Latin, never came into his possession. By the emperor Isaac Angelus Comnenus he was flattered, for serving his own purposes in favour of Dositheus, with the hope of being advanced to the patriarchate of Constantinople; and thus seduced, he maintained, in the assembly of the prelates, that the translation of the patriarch of Jerusalem to this elevated station, was agreeable to the canon law, and the prelates acquiesced in his opinion. But after this exercise of ingenuity and violation of consciences, he was deceived and disappointed; for Dositheus was preferred, upon the authority of his decision. Balsamon wrote several learned works on canon law; particularly 'Commentaries on the Apostoical Canons, the General and Particular Councils, and the Canonical Letters of the Greek Fathers.' Printed in folio, in Greek and Latin, at Paris, in 1620; and in two volumes folio, in 'Beverege's Pandects of Canons,' printed at Oxford in 1672. He also wrote a 'Collection of Ecclesiastical Constitutions, which may be found in Greek and Latin in 'Juxta Bibliae Canonica,' and other learned works. Fabr. Bibl. Greec. t. v. p. 33. t. ix. p. 184. t. x. p. 47. t. xii. p. 403, &c.

BALSANO, in Geography, a town of Italy, in the kingdom of Naples, and province of Dari; seven miles south of Dari.

BALSAS, a town of South America, in Peru, in the jurisdiction of Catamarc near the river Maragnon.

BALSAS, in Navigation. See Catamaran.

Balsey Cliff, in Geography. See Bawdsey.

Balsham, Hugh de, in Biography, an English divine, bishop of Ely, and founder of St. Peter's College, or Peterhouse, in Cambridge, was born, probably, at Balsam in Cambridgeshire, towards the beginning of the thirteenth century. In 1247, he was nominated by the monks of the Benedictine monastery of Ely, of which he was sub-prior, to the see of Ely; but Henry III. refused to confirm the nomination. Balsam appealed to the pope, and the business remained for ten years undecided. At last, however, the pope and monks prevailed. When the prelate was seated in his see, he projected the laudable design of providing education for poor scholars, and instituted a college, since known by the name of Peterhouse. He died at Dodington, in 1286, and was buried in the cathedral church of Ely. By his will he left many books to his scholars, and 300 marks for erecting new buildings. By an instrument, dated in 1291, his foundation was annually celebrated in his college. The distinction of jurisdiction between the chancellor of the university of Cambridge, and the archdeacon of Ely, was settled in 1276 by this prelate. B. Brit.

Balsio, in Ancient Geography, a town of Spain, twenty miles from Tarifia, near the Iberus, and south-east of Calagurris.

Balsora, in Geography. See Bassora.

Baltagi, among the Turks, porters, and vendors of wood, in the court of the grand signior; who also mounted on horsethback, when the emperor rides out. Part of them also, who for that purpose must be castrated, keep watch at the gates of the first and second courts of the seraglio. These last are called capigi, and their commander capigi prisci.

Baltas, in Geography, a town of Courland, 20 miles east of Seeburg.

Baltazarini, in Biography, an Italian performer on the violin, who seems first to have brought that instrument into favour at the court of France, before any honourable mention is made of it elsewhere in that kingdom. He was sent, 1577, at the head of a band of violin players from Piedmont, by marshal Brilhac, to Catharine de Medicis, and appointed by that princess her first valet de chambre, and superintendent of her music. The violin, however, seems to have been well known and in general use in Italy at this time, as Montagne, who was at Verona in 1560, says that there were organs and violins to accompany the mass in the great church. Journ. du Voyage. Baltazarini having contributed greatly to the amelioration of the royal family and nobility, by his ingenuity in suggesting magnificent plans, machinery and decorations, for ballets, divertisments, and other dramatic representations, received the quaint title of de Beaubourg. See Balet de la Royne.

Baltichatsko, a town of Siberia, 48 miles east of Kazanokirk.

Balteatus, in Entomology, a species of Cime (Spingius) that inhabits South America. It is oblong, ter-ribulous, with a transverse yellow line, and many teeth on the hinder thighs. Fabricius. Meielin.
BAL

BALTEATUS, a species of Elater, of a black colour; anterior half of the wing-cases rufous. Linn. Fl. Suec. A native of Europe.

BALTELUK, in Geography, a town of European Turkey, in the province of Bulgaria, twelve miles north-east of Varna.

BALTEUS, in Entomology, a species of Cerambyx, that inhabits Lusitania. The thorax is spiny; body ferruginous; abdomen ovate; wing-cases with a blackish band. Linnæus.

BALTHAZAR, Anthony, in Biography, surgeon at Leyden, published in 1722, "Pathologia Chirurgica," &c. 8vo. in which are some judicious observations on hernia congenites, and on wounds of the cerebellum, which he does not consider as mortal. He mentions a hernia of the brain, reaching from the occiput to the shoulder, and perforating living to an adult age, who were born with spina bifida. True schizura are not curable, he maintains, by internal medicines. The work has considerable merit; of the author, however, we have no particular account. Haller Bib. Chirurg.

BALTHAZAR, Christopher, a learned French Protestant, was born about the year 1588, at Villeneuve-lez-Paris, and though educated in the Roman church, induced by the study of ecclesiastical history to embrace the reformed religion, in order to account of this change in his religious profession, he was obliged to abandon the lucrative post of advocate to the prelate of Auxerre, and to remove to Charenton, at a distance from his relations and friends, where he was publicly received among the Protestants. He was afterwards patronized by a wealthy young councillor of Caîres, who, as an acknowledgment for the benefit of his instructions, allowed him a liberal pension. But attached to the Protestant cause, and desirous of promoting it, he left the house of his patron, and devoted himself to writing. His talents and zeal attracted the notice of the reformed party, and in 1659, the national synod of London granted him a pension of 750 livres. In his dissertations on the subjects in dispute between the Catholics and Protestants, he particularly opposed cardinal Baronius, and his papers having been read and approved by M. Daille, moderator of the synod of London, were ordered for publication. But being returned to their author, who soon after died, they were probably suppressed by him on account of the defect of their style, as they could not be found. In his animadversions on the animal Baronius, he is said to have been offensive to his style, that he was not able to finish a single page of his work in a day. Of his Latinity, a favourable specimen may be seen in his "Panegyric on M. Fouquet," printed in 1610. He also wrote in French "A Treatise on the Usurpation of the Kings of Spain upon the Crown of France," 8vo. Paris, 1626, and another tract upon the same subject, published in 1657. Gen. Dict.

BALTHEIS, Orinis, belt of Orion, in Astronomy, a part of the constellation of Orion, consisting of three bright stars of the second magnitude, placed nearly in a right line in Orion's girdle.

BALTHICA, in Genethalogy, a species of Tellins that inhabits the Baltic sea. This shell is roundish, smooth, white, or white tinged, Linn. Fl. Suec. It is found along the shore of a horbe-bean, and very rarely larger; extremely thin, pellucid, brittle, and white within. Chemitz, &c.

BALTHICA, a species of Helix found on the shores of the Baltic sea. The shell is imperforated, ovate, and pointed; with elevated wrinkle; aperture ovate, and very ample. Linn. Fl. Suec. This animal is black, with two tentacles; shell pellucid, and with four whorls.

BALTHICUS, a species of Nautilus, of the smaller kind, that is found adhering to the rocks of ice. This shell is sometimes opaque, sometimes opalescent, brightly pellucid; and the wreaths either smooth, twisted, ribbed, or tuberculated. It is specifically distinguished by being white, convex, aperture linear, and the first wreath much larger than the others. Schröck.

BALTIC, or EAST-SEA, anciently called Variaiffco mori, or the sea of the Varags or Varagians, in Geography, lies westward of Ruflia. Ptolemy calls it Venedicus sinus; Tacitus, mare Suevicum; and Phīs speaks of it under the name of Codanus sinus. The Russians denominate it Bätiskoi morę; the Germans the Oder-see; and the Swedes Oder-loon. That part of it which washes the coasts of the governments of St. Petersburg, Reval, and Vyborg, is called the gulf of Finland, which is above four hundred versts in length, and from a hundred to three hundred and twenty broad; the part extending between the governments of Riga and the island Efel, is called the gulf of Riga. The chief harbours in the Baltic are, Riga or Dinamoarte, Reval, Pernau, Habfoll, Rogervy, now called Baltic-port, Peterburg or Cronstadt, Vyborg, Frederickshamm, and Arenberg in the isle of Efel. The principal islands in this sea are, Ruigen, Bornholm, Oland, Gotland, Efel, Dago, Fälßter, Môn, Seylars, Penifari, Lanzarid, Peterstam, Hochland, Cronstadt. There are great fisheries in these parts, and numbers of seals are taken; but more considerable is the navigation; as it may be computed that every year upwards of two thousand ships of burden pass to and from the Russian ports alone. Much skill and caution are requisite for navigating this sea, and especially the gulf of Finland, both on account of the heavy squalls and gales of wind frequent here, and the multitude of rocks and shelves with which these seas abound. The water is only brackish, and has a very perceptible current, so that in northerly winds it is almost fresh to the tale. It is afforted, on very good foundation, that the water of the Baltic is every year decreasing; indeed, by repeated observations made in Sweden, it is found to subside at the rate of forty-five inches every hundred years. Mr. Otto (ubi infra) is of opinion, that nothing certain can be determined upon this point. Since the time when the Baltic was confined within its present boundaries, the decrease and increase of its water are, as he conceives, merely apparent; and it may have happened from various causes, that kind may have been gained in one quarter and lost in another. Large rivers, which flow with great rapidity, may, for example, have carried with them into the sea a great deal of earth and sand, by which the beds at their mouths may have been raised, and the banks extended towards the sea. The Baltic has Denmark on the south, Sweden to the west, Lapland to the north, and to the east Bothnia, Finland, Livonia, Ingría, Courland, and a part of Poland. It communicates with the Cattegatte to the south by the Sound, the great and the lesser Belt. At Pillau and Memel it communicates with two large lakes, the Frich Haff and Curich Haff, both of which contain fresh water. The waves of the Baltic are less high than in the ocean, but they succeed one another in greater number and with more impetuosity, and thus are more harassing to the ships. In its agitation it deposits amber on the shores of Courland and Prussia. It appears from Tacitus (De Moribus German, c. 44. 55) that the knowledge which the Romans acquired of the maritime powers of the Baltic was obtained by their land journies in search of amber. The Baltic is liable to be frozen for about three months in the year, which may probably be in part owing to the freethes
of its water, which again may be occasioned by the numerous rivers that flow into it. The number of these which directly or indirectly empty themselves into this sea, amount, according to Buffon, to 421, and among these the Oxer, the Vistula, &c., are the most considerable. We are afforded by history, that this sea has been sometimes totally frozen during severe cold. This was the case in 1533, at which time people could travel on the ice from Lubec to Prussia and Denmark; and on this occasion tents were erected in different places for the accommodation of travellers. A similar phenomenon occurred in 1559, and in 1523; and in 1423, people could walk and ride over the sea in a straight line from Helgoland to Lubec. Journeys of this kind were undertaken, six years after, not only from Prussia to Helgoland, but also from Mecklenburg to Denmark; and this was done likewise in 1559. The fisheries of the year 1709, and also of 1715, were also very remarkable. The depth of the Baltic, in most places, never exceeds 30 fathoms. In some few places of the gulf of Bothnia no bottom is to be found; but in others, quite near, the depth is not more than 50 fathoms.

It has been observed, that the water in the Baltic is colder even in the hottest summers than that of the other seas. The Baltic has no tides, or is not subject to a regular ebbing and flowing, as it is surrounded by land, and is united with the North sea only by the Sound and the two Belts; which circumstance has given occasion to its being called the inactive sea, or "Mare pigmentum." During a long continuance of the west wind its natural efflux is prevented, and a considerable quantity of water is forced into it from the North sea; so that it then rises on the coasts a little above its usual level. This connection, however, with the German ocean is sometimes the cause that the ebbing and flowing of the latter, though weak, co-operates with the Baltic; to those traces of their effects may be perceived. See Physical Observations on the East or Baltic Sea, by F. W. Otto, from "Abh. einer Naturgeschichte des Meeres, Berlin, 1792 and 1794, 2 vols. 8vo."

**Baltic Port, formerly called Rogervyk, was raised to a circle town in 1783, and one of the five districts of the government of Reval, or Estonia, according to the geographical division of the Russian empire in 1782 and 1783. Situate in a bay on the Baltic, in the government of Reval, lat. 59° 22'. long. 41° 51' 3". It has 110 timber houses, 211 inhabitants, and a brick church. This harbour has been greatly improved of late by art. Its trade arises from the fisheries, &c. but it has few or no manufactories.**

**Baltic Fishery and Commerce.** A considerable fishery is carried on along the coasts of the Baltic. The gulf of Riga and of Finland contain generally the same species of fish, and the employment which the produce of both occasion is nearly equal. The naturalist of Livonia (Fischer) enumerates in the waters belonging to that province forty-nine different species of fish, among which the salmon, herrings, pike, and lampreys, if not for home consumption, yet for exportation, are the most important. The salmon is caught in almost all the rivers, but those in the Dvina and the Narova are the best, though they come far behind those of Archangel in delicacy and plumpness; they are exported smoked and salted. The herrings, a degenerate species of herring, are everywhere found on the shores of the Baltic, but especially about Pernau, where they are in such quantities, that 300 of these small fish are bought for three or five kopecks; a ton of them when salted costs from three to five rubles. Formerly they were exported; but the northern herrings have annihilated this branch of commerce, which are at present even bought by Livonia, the herrings being not sufficient for the home and the foreign consumption. Yet influences are not wanting of 500,000 of them having been taken at one successful draught. One species of fish quite peculiar to these waters is the kylio, or smaller and more delicate variety of the true salmon, caught in great numbers in autumn near Reval and Rorevik. They are picked, and form a good substitute for anchovies and sardelles, and are accordingly, thus prepared, sent abroad to various parts. Not least exquisite are the potted lampreys that come particularly from Narva. The greatest part of the gulf of Finland consists of islands, salmon, and carp; even Tartars are found in the gulf of Cronstadt, and likewise at times in the Neva. Of the smaller sorts of fish with which the government of Vyborg is provided to a great extent, an exceedingly great quantity is brought alive in pierced vessels to St. Petersburg, and there sold cheap at the water-side in the barks which form a sort of fish market, and others that lie in various parts of the canals. In winter the transport of frozen fish from the remotest parts of the empire is also very considerable. The Russian commerce, in all the ports, which may be generally termed the Baltic trade, as it is stated by Mr. Tooke, from Hermann and Taube, amounted in 1790 to a sum of 35,570,000 rubles, of which the exports make 21,200,000, and the imports 14,350,000 rubles. Tooke's View of the Russian Empire, vol. ii. p. 73. 436.**

**Species 1. B. reliis. Gartn. Frat. 2. 444. An annual upright plant about two feet high. Stem four-cornered, channelled, green, rugged at the angles. Branches short, lateral; leaves opposite, dissected, ovate, acuminate, serrate, three-nerved, somewhat tomentose; flowers yellow, in terminal panicules; corollae of the disc tomentose, with black anthers. This is a distinct genus from Milikius, although the plant much resembles it. A native of Maryland, near Baltimore. Introduced in 1784 by Monf. Thouin. It flowers in June and July.**

**BALTIMORE, in Geography, a county of Maryland, in North America, lies between PatapSCO and Gunpowder rivers; the former separating it from Ann Arundel county on the south and south-west, and Gunpowder and Little Gunpowder dividing it from Harford county on the east and north-east. It has Frederick county on the west and north-west, Pennsylvania on the north, and Chesapeake bay on the south-east. Besides the rivers which bound it, and their branches, this county has Back and Middle rivers, between the two former, but they are rather arms of Chesapeake bay than rivers. In this county there are numerous iron works; and it contains 25,434 inhabitants, including 5,977 slaves.**
Baltimore, the chief town in the above county, and the largest in the state of Maryland; ranks in size the fourth, and in commerce the fifth, in the United States. It is seated on the north side of Patapco river, at a small distance from its junction with the Chesapeake, and surrounds what is called the Basin, in which the water rises at common tides to the height of five or six feet, and which is reckoned one of the finest harbours in America. This basin, says Weld, affords about nine feet of water, and is large enough to contain 2000 sail of merchant vessels. Along this basin are wharfs and stores through the whole length of the town. Baltimore is divided into the part called the town, and that called Fell's point, by a creek, over which are two bridges; but the houses are irregularly clustered from the one to the other. At Fell's point the water is deep enough for ships of burden, but only small vessels go up to the town. Wharfs have been built at this point, by the side of which vessels of 600 tons burden may lie with perfect safety. Here many persons have been induced to settle, on account of its contiguity to the shipping. Upwards of 700 houses have been already erected there, and regular streets laid out, with a large market place. These houses, generally speaking, are considered as a part of Baltimore, though they apparently form a separate town, being more than a mile distant from the other part of the town. Fell's point is chiefly the residence of seafaring people, and of the younger partners of merchant houses, who are stationed there to attend the shipping. The situation of Baltimore is low, and it was formerly thought injurious; but by its rapid increase, and the improvements attending it, the air is less loaded with vapours, and the town is become more healthy. The fea breezes, when the more open salt inhabitants retire to their country seats, delightfully situate in the neighbourhood. The principal street, called Market street, is nearly a mile long, and about eighty feet wide, and runs nearly from east to west, parallel with the water; it is crooked at right angles, much after the manner of those in Philadelphia, by other streets, several houses of which are well built, leading from the water. North and east of the town the land rises, and affords a fine prospect of the town and bay; the town, the point, the shipping both in the basin and at Fell's point, the bay as far as the eye can reach, rising ground on the right and left of the harbour, a grove of trees on the declivity at the right, and a stream of water breaking over the rocks at the foot of the hill on the left, all conspire to complete the beauty and grandeur of the prospect.

In 1787, Baltimore contained 1555 dwelling-houses, 1200 being in the town, and the rest at Fell's point. It then contained 152 stores. The number of the inhabitants of the town and precincts amounted, in 1791, to 13,559, including 1,255 slaves. But the number of houses and inhabitants have since that time very much increased. Mr. Weld, who visited this place in 1795, says that it contains about 16,000 inhabitants; among whom are to be found English, Irish, Scots, and French; but the Irish, of whom many are the principal merchants of the town, are the most numerous. Since the war it has received a great accession of French, both from France and from the West Indies.

Most of the inhabitants are engaged in trade. They are mostly plain people, sociable, however, among themselves, says Weld, and very friendly and hospitable towards strangers.

"There are many respectable families in Baltimore," says Morfe, "who live genteelly, are hospitable to strangers, and maintain a friendly and improving intercourse with each other; but the bulk of the inhabitants, recently collected from almost all quarters of the world, bent on the pursuit of wealth, varying in their habits, their manners, and their religion, if they have any, are unfocial, unimproved, and inhospitable." The churches and places for public worship are ten in number; one respectively for Episcopalians, Presbyterians, German Lutherans, German Calvinists, Reformed Germans, Niculists or new Quakers, Baptists, Roman Catholics, and two for Methodists. The built building, and the hand-mills in the town, is the Presbyterian church, lately erected. At Baltimore there are two theatres, that are used occasionally; cards and dancing are favourite amusements, both in private and public assemblies, which are held every fortnight. They have three incorporated banks in this town, and the number of notes issued from them, some of which are for so small a sum as a single dollar, is so great as almost to preclude the circulation of specie. Gold is extremely scarce. As for the rate of the trade of this town, Morfe informs us, that, in 1793, it owned 27 ships, one sloop, 31 bignautes, 34 schooners, and 9 spouts; in all 102, whose total tonnage was 13,574. The exports in the same year amounted to 2,327,770, and the imports to 1,049,829 dollars. In July, August, and September of this year, they amounted only to 343,584 dollars; but in the same months in 1795, they were advanced to 1,075,748 dollars. The police of the town is conducted by a board of town commissioners, a board of special commissioners, and a board of wardens; the first board supplies its own vacancies, and is perpetual; the two last are appointed by electors, chosen every fifth year by the citizens. Baltimore is distant 53 miles S.W. from Elkton, 176 N.E. from Richmond in Virginia, 50 N.E. from the city of Washington, and 163 S.W. from Philadelphia. N.lat. 39° 21', W.long. 77° 48'. Morfe's Geog. p. 353. Weld's Travels through N. America, in 1795, 1796, and 1797, vol. i. p. 43.

Baltimore Bay, lies near the extremity of the southern coast of Ireland, between two headlands, and runs a conﬁderable way into the land towards the north-east. The town, or village, from which its name, was formerly a place of trade, but being plundered by the Algerines, in 1631, it never recovered itself. It was one of the Irish boroughs, and sent two members to parliament. It stands on the south point of the eastern headland, in N. lat. 51° 15', and W. long. 9° 10'; and has a good harbour. The bay extends from Baltimore point on the east to Mizen head on the west, which are eight leagues aounder. It has several coves or harbours besides that of Baltimore, and contains many small islands.

Baltimore, in Ornitholog. a species of Oriolus, of a blackish colour, with a fulvous breast and belly, and a band on the wing of the same colour. Gr. othlos. Linn. Syll. Nat. This is le Baltimore of Briffon, Buffon, &c.; Baltimore bird of Catslyf; and Baltimore eorial of Latham.

"Baltimore birds are found in many parts of North America, the northern parts of which they occupy in summer, being seen sometime as far as Montreal in Canada, where they come in May; returning southward in the winter, which accounts for their being seen in Maryland and Virginia at that time. They make the nest of soft downy matter, in the shape of a purse, tying it with threads to the very extreme forked twigs of the tulip, plane, and larchey trees; in which they lay their eggs, and rear their young, free from depredators of all kinds.

"They are called fire-birds by the country people; and indeed, when in high plumage, their motions from branch to branch not inaply resemble a flash of fire." Latham Gen. Syn. 1738.

This kind is about seven inches in length. The male bird has the head, neck, and upper parts black; rest of the body, head,
hand of the wing, and lesser wing-coverts orange; greater
covers and quills black; the first tipped with white, which
forms a white bar on the wing; two middle tail feathers
black; four outer ones orange from the middle to the tips;
and the two next orange at the tip; legs and claws black.
The female, according to Buffon, has all the foreparts of a
fine black, like the male; tail the same; wing-coverts and
quills blackish; and those parts of a dull red, which are of a
dull orange in the male.

Baltimore, Bailiard. This is rather shorter than the
true Baltimore. The bill is lead colour; forehead and
cheeks black and yellowish mixed; hind head and nape:
olive-grey, marked with a few spots of black; upper part of
the back dull black; lower part of the back, the rump, fore-
part of the neck, breast, belly, sides, thighs, upper tail co-
verts, and under the wings, orange-yellow, brightened on
the breast and tail-coverts; lesser wing-coverts deep brown;
the greater the same, tipped with dirty yellowish white; quills
brown, bordered on both edges with whitish; the two
middle tail feathers are olive and black confusedly mixed;
and the four outer ones of a yellowish olive; legs and claws
blueish.

This latter bird is described by Linnæus under the specific
name of _spurius_. Dr. Latham, to whom we are indebted
for the preceding minute description, observes, that there
seems to be much confusion and uncertainty between the
tru and bailiard Baltimores and their females; and that at
last they may prove to be mere varieties of one single
species; all perhaps referable to one or other sex of the true
Baltimore, in different stages of life. See _Spurius
Orbis._

BALTINGlass, in Geography, a town of Ireland, in
the county of Wicklow, twenty-five miles west from Wick-
low.

BALTISTAN. See Little Thibet.

BALTURM, an island in the German sea, near the
coast of East Friesland, about 4 miles long, and about 1½
broad. N. lat. 53° 47'. E. long. 6° 56'.

BALTSHIK, a town of European Turkey, in the pro-
vince of Bulgaria, eighteen miles north-east from Varna.

BALTURTA, a salt lake of Afiatic Russia, in the go-
vernment of Orenburg; 144 miles S.W. from Ufa.

BALTZAR, Thomas, in Biography, the first great
performer on the violin who visited this country from the
continent, whose name appears in our musical annals; and
the account, which Anthony Wood gives of this extraor-
dinary musician, in his life written by himself, is so character-
istically quaint, minute, and amusing, that we shall tran-
scribe it in his own words; as it will at once convey an idea
to the musical reader of the superiority of Baltzar's execu-
tion, and of the taste of music at Oxford during the latter
end of the interregnum.

"Thomas Baltzar," says A. Wood, "a Lubecker
born, and the most famous artist for the violin that the world
had yet produced, was now (1658) in Oxford, and this day,
July 24, A. W., was with him and Mr. Ed. Low, lately or-
gamit of Ch. Ch. at the house of Will. Ellis. A. W. did
then and there, to his very great astonishment, hear him
play on the violin. He then faw him run up his fingers to
the end of the finger-board of the violin, and run them
back infenibly, and all with alacrity and in very good tune,
which he nor any in England saw the like before. A. W.
entertained him and Mr. Low with what the house could
then afford, and afterwards he invited them to the tavern;
but they being engaged to go to other company, he could
no more hear him play or fee him play at that time.
Afterwards he came to one of the weekly meetings at Mr.
El-

lis's house, and he played to the wonder of all the auditor,
and exercing his finger and instrument several ways to the
untoil of his power. Wilton (Doctor) thereupon, the pub-
lic professor, the greatest judge of musick that ever was, did,
after his humourome way, steepdown to Baltzar's feet, to
see whether he had a stuff on, that is to say, to see whether he
was a devil or not, because he acted beyond the parts of man.

"About this time it was that Dr. John Wilkins, after-
wards bishop of Chester, and called the flying Iffhop, warden
of Wadlam, the greatf curiofe of his time, invited him and
some of the musicians to his lodgings in that cell, pur-
pofely to have a concert, and to fee and heare him play.
The instruments and books were carried thither, but none
could be persuaded there to play against him in concert on
the violin. At length the company perceiving A. W. stand-
ing behind in a corner ware the dorre, they bailed him in
among them, and play, furthermore, he must against him.
Whereupon, he being not able to avoid it, he took up a vi-
olin, as poor Troylus did against Achilles. He abashed at
it, yet honour he got by playing with and against such a
grand master as Baltzar was. Mr. Davis Moll was accounted
litherto the best for the violin in England; but after Balt-
zar came into England, and shewed his most wonderful
parts on that instrument, Moll was not so admired, yet he
played sweeter, was a well-bred gentleman, and not given
to excessive drinking as Baltzar was." At the restoration of
king Charles II. Baltzar was placed at the head of his majesty's new band of violins. His com-
positions have more force and variety in them, and con-
sequently required more hand to execute them, than any mu-

sic then known for his instrument; as appears by a MS.
collection of his pieces, with which we were presented by the
late Rev. Dr. Montagu North.

Ant. Wood tells us, that this celebrated violinist died in
July 1663, and was buried in the cloister belonging to St.
Peter's church, at Westminster, and adds, that "this per-
son being much beloved by all lovers of musick, his com-
pany was therefore defired; and company, especially musi-
cal company, delighting in drinking, made him drunk more
than ordinary, which brought him to his grave." A. Wood's
Life, p. 190.

BALU, or Balou. See Bala.

BALUCAVO, or Jambol, a sea-port town of Crimea,
on the Black sea, with a fine harbour; the only one on this
sea capable of accommodating a large fleet.

BALVE, in Geography, a town of Germany, in the circle
of the Lower Rhine, a seat of a bailiwick in the duchy of
Weltphalia, seated on the Hohn, 10 miles S.W. from Aren-
berg, and 38 N.E. from Cologm.

BALUMA-Point, lies on the west coast of Africa, to
the south-east from Cape Rocko. N. lat. 12°.

BALSUS HEAN, the north-west point of the entrance
into Ballingkellings bay, on the south-west coast of Irel-
land.

BALUZE, Stephen, in Biography, was born at Tullas
in 1631, and as he advanced in years, directed his particular
attention to manuscripts, and to new editions of books, upon
which he bestowed much critical skill and erudition. His
principal object, however, was ecclesiastical history; and in
this department, such works as the lives and letters of popes,
and other eminent ecclesiastics, histories of councils, and
hymnies. In 1656 he was taken under the patronage of the
archbishop of Toulouë, and he was, after his death, libra-
rian to the famous Colbert. The king created in his favour
a chair of canon law in the royal college, appointed him ins-
fpector of the college, and granted him a pension. His
"Genealogical History of the House of Auvergne," writ-

•3 Y 2
ten at the instigation of cardinal Bouillon, gave such offence to the court, that the work was suppressed by order of the parliament of Paris, and the author deprived of his place and pension, and sent into exile; nor was he recalled to Paris till after the peace of Utrecht. In old age, he amused himself in writing the history of his native place, under the title of "Historia Tutellensis," printed in 1717, at Paris, in 4to. He died in 1718, much regretted by his friends on account of his amiable, obliging, and communicative disposition; and honoured amongst the learned for his extensive acquaintance with books and manuscripts. Gen. Dict.

BALZAC. John Lewis Guez de, was the son of a gentleman, whole name was William Guez, of Languedoc, and born at Angoulême in 1595, or 1596. In his youth, he attached himself to Cardinal de La Valette, who for two years employed him as his agent at Rome. On his return, he was introduced to court, and much admired. By the favour of cardinal Richelon he obtained a pension, together with the brevets of counsellor of state, and royal historiographer. His "Letters," 6 vols. published in 1624, clarified his reputation in early life, and were long regarded as perfect models in that kind of composition. "With much fine sentiment and beauty of language, they are, however, fluided, pompous, and inflated." With regard to style and manner, they form a contrast to the coarse and sprightliness of Voiture, though Balzac excells in respect to weight of matter. Such was this epitaphian writer's reputation, that those who were defiers of being thought "bel esprits" in France, wished to engage Balzac in a correspondence, that they might he in possession of one of his letters. His style became the subject of criticism; and even the morality of his writings was abused, without sufficient reason. Disgraced by this treatment, he retired to his estate at Balzac, on the borders of the Charente, near Angoulême; and there employed his time in study and composition, and in correspondence with his friends, among whom were some of the most learned and eminent of his countrymen. He was deemed a good classical scholar; and he wrote Latin with ease and elegance; and his conversation was unaffected and agreeable. His general character was that of a good man, and a devout charitable citizen. He fret apart, even in his lifetime, eight thousand crowns of his estate, to be distributed to pious uses. He built two chambers in the convent of capuchins at Angoulême, where he often resided; and at his death he bequeathed 12,000 livres to this hospital, and he left an estate of 100 francs per annum, to be appropriated every two years as a prize to him who, in the judgment of the French academy, of which he was a member, should write the best discourse upon a subject of religion. He died in 1654, and was buried, according to his own order, "at the feet of the poor interred" in the hospital at Angoulême. "The French language (fays Voltaire, age of Louis XIV.) is under very great obligations to Balzac. He first gave number and harmony to its prose." In early life he seems to have been unduly admired, and afterwards he sunk into unmerited degradation and neglect. His principal works are his "Letters," printed at different times; "Le Prince;" "Le Secret de Christ;" "L'Abbe, or Entretiens;" "Latin verses," in three books, of which his "Amours," and "Christ victorious," are most esteemed. All these have been collected in two volumes, folio, and were published at Paris in 1669. Gen. Dict. Nouv. Dict. Hist.

BAMBA, in Geography, the largest and richest province or duky of the kingdom of Congo, in Africa, situated between the rivers Ambrifi and Looze; the laff of which parts it from the marquisate of Pemba on the east, and the Ambrifi from the county of Sangi on the north. Along the sea-coasts it extends still farther northward to the river Lelunda, and on the south to that of Danda, which separates it from the kingdom of Angola. The governors of this province bear the title of dukes, and are always princes of the royal family, being as despotic and arbitrary as if they were really kings. The soil is fertile, and capable of producing all the necessaries of life in great abundance, if it were only cultivated. The sea-coasts produce a large quantity of salt, which forms a considerable article of exportation. The fisheries of the Zimbib, whose shell is the current coin in this and the two neighbouring kingdoms, furnishes also a valuable source of revenue. Several authors have added a third kind of treasure in this province, viz. the mines of gold, silver, quicksilver, copper, tin, and iron, which are found in the mountainous parts; but the richlues, and even the reality of these mines, have been questioned; and it is certain, that the iron mines are only allowed to be used, and that there are severe laws against meddling with any of the vein. The interior of the country furnishes elephants, buffaloes, tigers, civets, and parrots; and here is a considerable traffic of slaves. The people are numerous, strong, and warlike. In this province is a town of the same name, which is large and populous, distant about seventy leagues from the sea, and in the poffilion of the Portugese.

BAMBA, a collection of villages in the kingdom of Demba, in Abyssinia, near the western bank of the lake Tzana, or Demeba. N. lat. 12° 11'. E. long. 37°.

AMBALA, in Ancient Geography, a maritime town of India, on this side of the Ganges. It is.

AMBARACA, in Geography, a town of South America, in Peru, and jurisdiction of Patas, or Casamamarquina.

BAMBAN, a town of Upper Egypt, seated on the Nile, about forty-two miles S.S.E. of Einch. N. lat. 24° 26'.

BAMBARA, an extensive kingdom of Western Africa, bounded by the Moorish kingdom of Beero to the north, and Moos, a French state south of Beero, by the districts of Gotoo, Baad, and Mariana, and Soudan, to the east, by Korg to the south, and by Lucamar and Kaarta to the west. The course of the river Jolohib, or Niger, lies through this country; and its capital is Segu, seated on this river, in N. lat. 14° 10' 20', and W. long. 2° 1'. The language of Bambara was found by Mr. Park, in his travels through this country, to be a sort of corruptions Mandingo; and from Mumbo, the king, who resided in this city, he received tokens of favour, though from motives of prudence he was not admitted into the royal presence, and he was ordered to leave Segu. This beneloct prince, in spite of the jealous machinations of the Moorish inhabitants, thought a stranger in distress a proper object of compassion and relief; and probably dissuaded him under an apprehension that he might not be able to afford him effectual protection against their blind and invertebrate malevolence. This country is beautiful and highly cultivated; and at Kali, which Mr. Park visited, and which is situated at a small distance from Segu, it bore, according to this traveller, a greater resemblance to the centre of England, than to what he should have supposed to have been the middle of America. The fish-trees (see Sphen), from which the inhabitants prepare their vegetable butter, constituting a main article of their inland commerce, abound in this part of Bambara. Whiff Mr. Park travelled through this country, he was much incommoded by the tropical rains; and he was chiefly indebted for his daily support to the Dootty or chief man in the several towns through which he passed. This officer seems to posses the authority of mayor in the corporate towns
towns of England; and it reflects great honour on the police of the African kingdoms, or on the benevolent manners of the natives, that it is considered as one part of the duty of a prince to relieve them in the indigent traveller. "To suffer the king's vassals to depart hungry," as they express themselves, is an effusion of a very heinous nature. See Africa, and Sigo.

**BAMBERG**, in Geography, a principality and bishopric of Germany, in the circle of Franconia, is bounded on the north by the principality of Coburg and the Vogtland, on the east by Brandenburg-Bayenthal and the states of Nuremberg, on the south by the states of Nuremberg and the principality of Schwarzengerg, and on the west by the bishopric of Wurtzburg. It is about sixty miles long, and forty broad; the soil is good, and produces all sorts of grain, fruit, and wine; and in the vicinity of the capital are such numbers of larch, fig, lemon, and orange trees, that this spot is generally called the garden of Italy. The inhabitants alight on a considerable number of cattle. The principal rivers are the Mayn, the Rotach, the Itz, and the Regnitz. It contains eighteen cities and fifteen market-towns. At the diet of the empire, the bishop, whose revenue is about 750,000 florins, takes the fourth place in the council of spiritual princes. The inhabitants are Roman Catholics. The military consists of one company of 100 men, and 50 horses.

BAMBERG, the capital of the above bishopric, is said to have derived its name from Baba, sister to the emperor Henry I. and is pleasantly situated on the river Regnitz, in the midst of a fruitful country. It was formerly an imperial city, but is now subject to its bishop. The town is large and populous; and being situated in the centre of Germany, contiguous to seven or eight different states, it is a very great thoroughfare. The streets are wide, and the buildings neat and regular. It has no fortifications, but lies open, and has the appearance of a large village. The cathedral is one of the most magnificent in the empire. The chapter is composed of twenty capuchin canons, and fifteen canonized. The bishopric was founded by the emperor Henry II. in 1106. Among other curiosities deposited in the treasury of this church, are the imperial crown of Henry II., consisting of six plates of gold adorned with precious stones, and another of his emblems, composed of two circles of gold richly set with pearls and jewels; and also a folio MS. of the four gospels in Latin, upon fine vellum, in a neat Roman character, with Gothic letters interlined, and very beautiful miniatures; the binding is adorned with pearls and precious stones. There is another Latin MS. in folio, of the four gospels, with a commentary by St. Jerome, and fine miniatures; and a third in Gothic letters, with a binding of very great value; all of which were presented to this church by Henry II. In this city there are several convents of monks and nuns, two palaces, and an university, founded in 1317. The bishop is absolute sovereign of this town and district, and has several castles and royalties in Carinthia and other parts of Germany. He holds immediately under the see of Rome; and he is joint director of the circle of Franconia with the marquis of Culembach. The benefits in this bishopric and that of Wurtzburg are reckoned the best in Germany. Within nine miles of Bamberg, at a place called Pommersfelden, there is a beautiful palace belonging to the house of Schonborn, which may be considered as one of the best in Germany. N. lat. 49° 51'. E. long. 10° 50'.

**BAMBERG** is a town of Germany, in the circle of the Lower Rhine, twenty miles south-west of Mentz, and eight north of Bingen.

**BAMBIINI**, in Biography, a spirited Italian composer, who arrived at Paris during infancy, with the company of burletta singers who first performed in that capital the *Serba Patrana* of Pergolesi, which gave birth to Rouffian's admirable "Lettre sur la Musique Française," and raised a party for Italian music, which has never yet been forgiven, even by those who pretend to admire no vocal music but Italian, or German on that model. See Accom-paniment.

**BANDELA**, in Ornithology, a species of Turdus, that inhabits Cayenne, and is about the size of the common or domestic sparrow. It is spotted; above Rufous brown; beneath emerald; wings black, with a transverse white band. This is the black-winged thrush of Latham, and *lamba* of Buffon.

**BAMBOO**, in Commerce, an East India measure, containing five English pints.

**BAMBOCCIO**, in Biography, an eminent painter of conversations, landscapes, cattle, &c. was born at Laer, near Norden, in 1613; and for his real name of Peter Van Lacer, they substituted in Italy that of Bambocco from his uncommon figure, the lower part of his body being one-third part larger than the upper, and his neck so short that it was buried between his shoulders. His genius, however, was very great; and his talent extended to every part of painting. He resided at Rome for 16 years, and availed himself of the opportunities for improvement which that city afforded him. His style of painting is sweet and true, and his touch delicate, with great transparency of colouring. His figures are well proportioned and correctly designed; and though his subjects are deduced from the lower kind of nature, such as plunderings, playing at bowls, inns, farriers' shops, cattle, or conversations, his designs and execution were so excellent, that his manner was adopted by many of the Italian painters of his time; and he has been justly ranked in the first class of eminent masters. His hand was as quick as his imagination, so that he seldom made sketches or designs; but having marked the subject with a crayon on the canvas, he immediately finished it. He possessed an astonishing memory, and the idea of any objects which he saw was so strongly impressed on his mind, that he could present them with as much truth as if they were placed before his eyes. The close of his life was embittered by an ambitious complaint; and it is said, that in order to terminate his misery, he threw himself into a canal, and was drowned. A.D. 1673. Pilkington.

**BAMBOO**, in Botany. See *Arundo*, and *Nastes*.

**Bamboo Habit**, a Chinse invention, by which a person, who cannot swim, may easily keep himself above water. Four bamboos, two before and two behind their bodies, are placed horizontally, and project about twenty-eight inches. They are crossed on each side by two others, and the whole properly secured, leaving a space for their body; it is put over their heads, and tied securely in two minutes.

**BAMBOURGH**, in Geography, a village of England, in the county of Northumberland, near the coast of the German ocean, with a castle said to be built by Ira, king of the Northumbrians, in the year 548. This castle with the clafe was purchased by Crew, bishop of Durham, and
left to charitable uses. One of the trustees, Dr. Sharp, prebendary of Durham, refixed in this castle, and appropriated a part of it to the accommodation of shipwrecked mariners, and to the purposes of a granary, which served for the supply of the poor with corn, in dear feasons, at a low price. A patrole was kept every stormy night through the whole extent of the manor, which was eight miles, for the succour of the distressed; and by the mode of firing a cannon from the castle, the place where any disaffected accident occurred was pointed out, and directions given for the neighbouring people to afford subsistence. This village is four miles south of Belford, and 2 3/4 north of London.

BAMBOOTHUM, in Ancient Geography, a river of Africa, in Lower Libya, from which extended a chain of mountains as far as Mount Ticon Ocherna. Plliny.

BAMBOUK, in Geography, a kingdom of western Africa, situated between the rivers Bafing and Faleme, which, by their junction with the Kolero and other streams, form the river Senegal; and bounded on the north by Kajagga and Kaffiion, on the east by the rivers Bafing and Brooko, on the south by Konkoodeo or Concoudou, and Satadoo, and on the west by the river Falame and Bondou. The town of Bambouk is seated on a stream which joins the river Falame, and lies, according to Rennell's map, in about N. lat. 15° 24'. W. long. 9° 16'. This country, according to the account of the proceedings of the African Association, is inhabited by a nation whose woolly hair and fable complexion denote them to be of the negro race; but their character seems to vary in proportion as the country rises from the plains of its western division to the highlands of the east. The inhabitants are distinguished into sects or parties like the people of Woolli and Bondou, by the different tenets of Malnomants and Desilts; they are equally at peace with one another, and mutually tolerate the opinions they respectively condemn. Their chief occupations are agriculture and pastoralage; but they have made such progres in the arts and manufactures, that they are able to fress iron, and to furnish themselves with the several instruments of husbandry and war. Their processes for weaving cotton cloth, the habit of this part of Africa, is difficult and laborious. Their common vegetable food appears to consist of rice, and their animal diet of beef or mutton; a liquor prepared from fermented honey supplies the want of wine, and furnishes the means of those festive entertainments that contribute the luxury of the country of Bambouk. The king of Bambouk gave to a merchant a friendly reception at Ferkany, where he refixed; but the major did not long survive this visit. The mountains of Konkoodeo, characteristically so called because it is the "country of mountains," extend through Bambouk and Kaffiion, and are productive in gold. Proceedings of the African Association, by major Rennell, 1758.

BAMBRIDGE, or BAMBRIAGE, Christopher, in Biography, an English divine, was a native of Hilborne, near Appleby, in Westmorland, and a student in Queen's college, Oxford. By a rapid progress he was advanced, in 1597, to the see of Durham; and in the next year, to the archbishopric of York. Under Henry VII. he regained that royal favour, which had been interrupted in the reign of Richard III.; was made almoner to that prince, and employed by him in several foreign embassies. In the reign of Henry VIII. he was engaged in a negotiation with pope Julius II. under a pretence of restoring peace to Europe, but in reality to extort the pope's enmity against the king of France. Bambridge, attentive to his own interest, contrived so to ingratiate himself with the pope, as to obtain a cardinal's hat and an informal prelency in the conclave. He was also appointed legate of the ecclesiastical army, which was then besieging Basilia. Upon his return home, he manifested his gratitude to the pope by inducing his royal master to enter into an unnecessary war in his defence. Ambition seems to have been the ruling principle of Bambridge; of his learning no evidence remains; and as to his temper, no favourable opinion can be entertained of it if we advert to the tragical incident that closed his life. Inflamed with resentment against Renaud of Modena, his major-domo, he fell upon him with fury and beat him; and the enraged domestic revenged himself for the insult and abuse, by administering to his master a dose of poison. This happened at Rome, on the 14th of July 1514. Brog. Brit.

BAMBUKALAISI, in Geography, a town of Afiatic Turkey, in the province of Notilia, twelve miles north of Degniizu.

BAMBUSA, in Botany, Lin. gen. Schreb. 607. Clas. hexandra mongonius. Gen. Char. Cal. none, except glume-like bracts fattereed, often three under each spikelet, oblong, pointed, concave, keeled, unequal, shorter than the floccules, two opposite, the third leaning on the flat side of the spikelet; spikelets lanceolate, dillicious, compressed, sharp, nearly five-flowered. Cor. glume two-valved; valve inferior, oblong, ventricose, acuminate, towards the tip keeled and streaked; interior lanceolate, flat, with complicated margins, ciliate, a little longer than the inferior, and projecting from it; ciliate two-leaved, flat at the anterior side of the germ; leaflets ovate, acuminate, bearded at the tip, membranous. Stam. filaments free, capillary, almost the length of the corolla; anthers paratached, two cleft at the base. Ptil. germ oblong, six-angled capillary, two cleft; filigree featherly. Per. none; corolla cornishes the seed, gates? Iets it fall? feed single, oblong. Obs. The superior floccules in several spikelets examined by Schreber were merely male; he therefore says, "ought not this genus to be transferred to polygonia?" For the refl see ABOUS BAMBOS, and NAStUS. Gmelin has made two genera of this, under Bambus, and Natalus.

BAMBYCE, in Ancient Geography, a town of Asia, in Lydia, beyond the Euphrates; called also, according to Strabo, Edessa, and Hierapolis.

BAMIFF, or BANIFF, in Geography, the capital of Banffshire, in Scotland, stands on a gentle declivity at the mouth of the Deveron, a considerable stream which has its source among the mountains of Aberdeenshire, and after winding through narrow valleys and well cultivated plains, falls into the Moray firth, a little below this ancient burgh. The earliest authentic document we meet with relating to this town dates, that Robert II. by virtue of charter, dated October 7, 1372, conferred on it all the immunities and privileges of a royal burgh; which were afterwards confirmed by James VI. and further by his grandson Charles II. Soon after the union of South and North Britain, this burgh, in common with many others, lost much of its political importance; as by that event it was united with Inverary, Cullen, Elgin, and Kintore, which return but one representative to parliament. Agreeable to the Scot. or municipal government of Banff, two thirds of its magistrates are elected annually. Duff-Houfe, the family residence of the earl of Fife, together with the pleasures grounds and plantations around that truly magnificent mansion; the harbour which is defended by a battery, and the shipping; the plain unsubstantial bridge of seven arches over the smooth winding Deveron; the castle of Banff belonging to the earl of Finlade; the town house and prison, including its hand- some spire; the parish church, an elegant and newly built structure; are striking and interesting objects, with respect to
BAM

BAM

to the general appearance and commercial consequence of this flourishing sea-port town. The industry of its inhabitants is sufficiently manifested in their various employments; and those of condition for a laudable example in the improvements carried on in the immediate vicinity; so that in all likelihood Banff bids fair to accumulate wealth under circumstances favourable to the spirited exertions of those engaged in commerce and trade. The salmon-fishery extends about four miles on the Deveron. It belongs to the earl of Fife; and it yields him a yearly rent of 1250l. The sight of this property, together with some land, was, in A.D. 1470, by reason of the poverty of theburghers of Banff, alienated to perpetuity for a small annual fee duty or fine for the purpose of keeping the parish church and prison in proper repair. Before the reformation, there was a convent dedicated to the Virgin Mary, which belonged to the order of Carmelites, or white friars; its house and lands were annexed to the old college of Aberdeen, in A.D. 1617; and in the year 1751, they were purchased by the present earl of Fife. The ecclesiastics, both episcopal and prelatory, are on the belt terms with each other. The former are under the jurisdiction of the bishop of Aberdeen; and the latter is under the presbytery of Fordeyce. The unfortunate James Sharp, archbishop of St. Andrews, the arch-episcopal see of Scotland, was born in the castle of Banff, in May 1613.

The parish of Banff is about six miles in length and two in breadth; its surface is beautifully diversified, and the soil is generally good, though of different qualities. The greater part is kept in ploughland, on which a number of black cattle are annually reared. Population of the town in 1800, 3571. Banff is about 165 miles north of Edinburgh. In the vicinity of this town is Duft-houfe, the magnificent mansion of the earl of Fife. This was built after the designs of the late Mr. Adam. It is enriched with fluted columns, sculptured cornices, and statues, vases, &c. which give peculiar elegance to its external appearance. The internal is splendidly furnished, contains a large, well-featured library, and many valuable paintings, &c. Cordiner's Antiquities and Scenery of Scotland.

BAMFORTHSHIRE gives name to one of the counties in Scotland; it is bounded on the north by the Moray frith, on the west by the counties of Moray and Inverness, and on the south and east by Aberdeenshire. It extends about 35 miles in its longest diameter north and south; and its average breadth is about 16 miles. Within its boundaries are included twenty-four parishes, and two royal boroughs. The surface of the country is agreeably diversified with hill and dale, well-watered with rivers, and ornamented with several seats and their annexed plantations. The principal of these belong to the duke of Gordon, earl of Findlater, earl of Fife, and lord Banff. Part of the county is mountainous; but the lower lands, and those in the vicinity of towns are in high cultivation. Its principal rivers are the Spey, which partly divides this county from Morayshire; the Deveron, which separates it from Aberdeenshire; the Tna, Coniglas, Avon, and Fiddich. Some valuable minerals are found in this county; and great quantities of bones and whetstones are obtained from a hill in the district of Balvenie. Several mountains are noted for their elevated summits. Of these Cairngorm, about 4050 feet in height, is the chief, and is reckoned among the highest of the Grampian hills. That of Beinnies runs to the height of 2690 feet above the level of the sea, and Knock-hill is estimated at 2500 feet. At Portlo, near the north coast, is a stratum of serpentine, called Portlo marble, also a species of granite, which when polished exhibits various figures and characters, some of them resembling those of the Arabic and Hebrew alphabet. A great number of tumuli are scattered over the hills near the coast; and some Druidical antiquities are in this district. The population of this county, according to the parliamentary report in 1800, was 35,807.

BAMIAN, or Bamiyan, a city which some have referred to Khomran, in Persia; and others, with greater propriety, to that part of independent Tartary, called great Bucharia, near its southern limit, at the foot of mount Casafar, or near that part of this range of mountains called Paropamisus, and Hindoo Khuo, and not far from the ancient Alexandria. Bamiyan belongs to the same portion of Bucharia which includes Gaur, and lies between this province and Cabul. It is eighty-eight geographical miles from Ghizni, N. lat. 34° 50'. "E. long. 67°. It gives name to a district that extends from Bafk towards the east, or the kingdom of Cabul. This famous city, denominated the Thebes of the east, is situated on the road between Bafk, or Bahl, and Cabul; and they reckon eight mazails, or days' journey, from Cabul to Bamiyan. Like Thebes in Egypt, it is entirely cut out of an inflated mountain, and the valley it is called, in the language of the country, the Tagavi of Bamiyan; Tagavi being synonymous with Purganah or district. Nearly to the south are the ruins of several buildings of masonry round a small conical hill; on the summit of which are the remains of the palace of its ancient kings. A rivulet, rising in the adjacent hills, goes through the ruins of Ghulghul and theTagavi of Bamiyan, and falls into a small lake, from which issue four rivers, the Himend, the Landhi-Sindh, the rivers of Bahlac, and of Conduz. The city of Bamiyan consists of a great number of apartments and recesses, cut out of the rock; some of which, on account of their extraordinary dimensions, are supposed to have been temples. Some of them are adorned with niches and carved work; and there are some remains of figures, in relief, which have been delineated or disfigured by the Moslems. Some remains of paintings on the walls are still to be seen; but the smoke has almost obliterated them. In the Ayeen-Akberry it is said, that there are about 12,000 of these recesses in the Tagavi of Bamiyan; and this account is confirmed by the general report of travellers. The country of the Afghans, as far as Bahlac and Badahan, abounds with these recesses, called Samakches in the language of the country, or Samages in Persian. The most perfect are at a place called Mobi, on the road between Bamiyan and Bahl; but as they are situated among precipices, the Musulmans have not thought of using them as habitations; the paintings with which they are adorned appear quite fresh. The attention of travellers is particularly attracted by two colossal statues, which are seen at a great distance. They are erect, and adhere to the mountain from which they were cut out. They are in a sort of niches, the depth of which is equal to their thickness; and in the Ayeen-Akberry, the largest is said to be eighty feet high, and the other only fifty. But these dimensions are exaggerated; and the truth seems to be, that they are only fifty cubits high. At some distance from these, there is another about fifteen cubits high. Authors are disadvised both as to their sex and their names. A late traveller says, that the drapery is covered with embroidery and figured work, which was formerly painted of different colours; one seeming to have been red, and the other retaining the original colour of the flax, or having been painted grey. According to Dr. Hyde, one of these statues is called Surkk-but, or the red idol, and the other Khink-but, or the grey idol. Between the legs of the male figure is a door leading into a spacious temple, at the entrance of which are flattened a few wretched Banyans, who fell provisos to travellers. According to Persian authors, Bamiyan must have existed before
BAM

before the flood; but the followers of Buddha insist, that it was built by a religious man called Shama, supposed to be the same with the patriarch Shen, and that his polity lived there for several generations. Hence Balk-Bamian is said to have been originally the place of abode of Abraham, who, according to scripture, and the Hindoos sacred books, removed with his father to different countries to the westward. According to Diodorus Siculus, Bamian existed before Ninus; for this historian, as well as the Parthian authors, has mistaken Bahlae for Bamian, which he describes as situated among steep hills; whilst Bahlae is situated in a low, flat country, at a great distance from the mountain. The natives look upon Bamian, and the adjacent countries, as the place of abode of the progenitors of mankind, both before and after the flood; meaning by Bamian and the adjacent countries all the country from Sistan to Samarcand, reaching towards the east as far as the Ganges. This tradition is very ancient, and is contemporaneous equally by Parthian authors and the sacred books of the Hindoos.

Bamian, as well as Cabul and Balk, were at an early period in the hands of the Mussulmans. There were even kings of Bamian; but this dynasty lasted but a few years, and ended in 1215. The kings and governors resided at Ghulghuleh, called at that time the fort or palace of Bamian. It was destroyed by Genghiz Khan, in the year 1210; and because the inhabitants had presumed to refit him, he ordered them to be butchered, without distinction either of age or sex; and in his brutal rage, he spared neither animals nor even trees. He ordered it to be called in his own language Mau-balig, or the city of grief and sorrow; but the inhabitants of the country called it, in their own dialect, Gulguleh, which word used also in Parthian signifies "the cries of woe." To have rebuilt it would have been ominous; and, therefore, they erected a fort on a hill to the north of Bamian, which is called to this day the imperial fort. This fort was also destroyed by Zingis theTuebek, in 1228, and has not been rebuilt since. The city of Bamian is represented in the ancient legends of the country as the fountain of purity and holiness; and was called Para-Bamian, or Bamian the pure and holy, and the district of Bamian might also be called Para-defa, the pure and holy country. It is now barren, and without a single tree; but, according to the sacred books of the Hindoos and of the Buddhists, it was otherwise formerly. Tradition also informs us, that the number of inhabitants was at one period so prodigious, that the trees, underwood, grass, and plants were destroyed.

The vegetable soil being no longer protected, was in the course of ages washed away by the rains; and it is certain, that the soil in the valleys is very fertile, and the whole district, in its present state, is a most enchanting and delightful spot. The country to the eastward of Bamian, as far as the Indus, is the native country of the vine, and of almost all the fruit-trees we have in Europe; there they grow spontaneously, and to a great degree of perfection. When the natives find a vine, an apple-tree, &c. in the forest, they clear all the wood about it, dig the ground, and thus the fruit comes to perfect maturity. "When we are told in scripture of Noah cultivating the vine, we may be sure (says captain Wilford, ubi infra), that it was in its native country, or at least very near it." Bamian, though not mentioned by name in Nonnus's Dionysius, is well described by him as the abode of the benevolent Brongus, who lived in Samachnes, or recedes artfully excavated in the mountains. Brongus was the Ebranga of the Parans; and had several children, who ascended the throne of Calunga, after their father had forsaken the world. Bamian appears also to be the town called Drahloca by Poleni; which is derived from the Sanscrit Drahotaca, and implies the lone-city; towns before being merely an assemblage of huts. Its distance and bearing, says captain Wilford, from Cabula, or Orthopiana, the present city of Cabul, puts it beyond doubt. See captain Francis Wilford's "Observations on Mount Caucasus," in Asiatic Researches, vol. vi. p 495.

BAMMAGURA, in Ancient Geography, a town of India, on this side of the Ganges. Poleni.

BAMMAKOO, in Geography, a town of the Mandingo country, in Western Africa, seated on the river Niger, where it scales to be navigable, about 150 miles below its source. Here the river descends of the high land of Manding to Bambara, on the eastward, with a rapid and furious course; after which it plies so suddenly along, and affords an interrupted navigation to Honfia, and probably by Kallia to Warmara. It lies about fifty miles short of Kamliah; and it is reckoned by the natives ten journeys only from Segu. By Mr. Parke's bearings corrected, it lies from Segu W. 29° S. distant 178 geographical miles. N. lat. 12° 54'. W. long. 7° 26'.

BAMMONITIS, in Ancient Geography, a country of Asia Minor, which Strabo places in the vicinity of the river Hals.

BAMTH-Baal, a city of Palestine, beyond Jordan, belonging to the tribe of Ruben, situated in the plain through which lay the course of the Arnon. John xiii. 17. In this city was a high place consecrated to Baal, the idol of the Moabites.

BAMPTON, in Geography, is an ancient market town in the county of Devon, in England. Polwhele affirms that it was a Roman station; but this is not proved by his description of the parish, nor by any discoveries that have been made relating to that people. It is leated on a branch of the river Exe, and is also watered by the river Batheam, over which is a strong stone bridge. The town is nearly encompassed with hills which confine chiefly of lime-dune rocks. There are burnt on the spot, and the lime used by the neighbouring farmers in fertilizing the soil of their lands. Bampton is governed by two portreves, two confables, and other inferior officers, who are annually elected at the lord's court. The principal manufacture of the place is serges. This was formerly a borough, and sent two members to parliament, whose expences were defrayed by the inhabitants; but this privilege has long been lost. It gives mow to the hundred, and includes within the parish two small villages, whose chaps have only monthly service. The town is irregularly built, and extends about half a mile in length; containing 502 houses, with 1564 inhabitants. There is a large church with a lofty tower, and the church-yard, which is extensive, contains two yew trees, distinguished for their age and magnitude. The market is held every Saturday, and here are two annual fairs. Bampton is 167 miles west of London, and about twenty-two N. W. from Exeter. Polwhele's History of Devonshire, vol. ii.

BAN, a fort of smooth fine muflin, which the English import from the East Indies. The piece is a yard broad, and runs about twenty yards and a half.

BAN and Dute. See Bann and Banes.

BAN [land], in Geography, is the most southerly of the Ladrones, north of New Guinea, in N. lat. 11°, and E. long. of the east end 142°. Between this and Bato island, on the north, is a rocky island.

BAN, Arriva. See Arriffe.

BANA, in Ancient Geography, a town of Arabia Felix. Poleni.

BANAUSI, a town of India, on this side of the Ganges. Poleni.

BANABA, a town of Asia, in Melopotamia. Poleni.

BANAGHIER, in Geography, a market and port town of
of the King's county, in the province of Leinster, in Ireland, which, before the union, returned two members to the house of commons. Here are an excellent endowment for a school, and an ancient bridge over the Shannon, on which river it is situated, but it is a very inconvenient town. Its distance well from Dublin is 65½ Irish miles.

BANAMATAPA, a town of Africa, in the country of Monomotapa, provinc of Mozambique.

BANANA, in Botany. See MUSA.

BANANA. From the Latin banana, the name of a small tree, in which the entire structure of the flower is very remarkable. The flower of a banana tree is a large handsome structure, built by the above bishop Alexander, who is supposed to have been buried in the church, on which is a conjectural mutilated figure. The outer walls of the church are ornamented with a number of carved heads of men and animals. Banbury has been particularly noted for the number of Puritan inhabitants, who have been signalized by Ben Jonson, and other dramatic writers. Camden speaks of it as famous for cakes and ale; and when Holland translated his Britannia, he changed the latter word, and printed it cakes and ale. Here are a free-school, two charity schools, and a workhouse.

BANABURG. A little town, and a borough of Lincolnshire, in England, lies about 10 miles from the sea. It was founded in the reign of Edward VI., when bishop Holbech conveyed it, with about thirty other manors, to the king and his courtiers. The estate was afterwards given by queen Elizabeth to the bishopric of Oxford in exchange for other lands. In the time of Henry VIII., 1534, it was valued at 141L. 13s. 10d. but at the time of the above exchange it was estimated at 49L. 18s. 6d. a year.

This place was made a borough by queen Mary, who being pleased with the inhabitants for their support of her against lady Jane Grey, granted them a charter, and invested the town with several privileges. This charter was altered by James I., who appointed the government of the town to consist of a mayor, twelve aldermen, and thirty burgesses. A new charter was granted by George I., A.D. 1718, and the town is now governed by a mayor, high steward, recorder, six capital burgesses, and thirty aldermen, a town-crier, and two farrers to the market.

The church, which is a large handsome structure, built by the above bishop Alexander, who is supposed to have been buried in the church, on which is a conjectural mutilated figure. The outer walls of the church are ornamented with a number of carved heads of men and animals. BAN

BAN

bang in that island; on which the sovereign of Banca, who is puffed also of the territory of Palamabong, keeps his constant residence. He maintains his authority over his own subjects, and his independence of the neighbouring princes, in great measure, by the affair being of the Dutch, who have a settlement and trade at Palamabong, and who enjoy the benefit of a contract with the king of Banca for tin, which his subjects procure from thence; and which, like the king of Bantam, with regard to pepper, he compels the miners to deliver to him at a low price, and he sells it to the Dutch at a small advance, agreeably to his contract. This island is celebrated throughout Asia for its tin-mines, which were first discovered in 1710 or 1711, and which since that time have yielded immense quantities of ore, and appear to be inexhaustible. It is dug chiefly in seven places, which are under the direction of Chinese managers, that provide and pay the labourers, who are also, in general, of that nation. These miners reduce the ore into metal byemploying wood as fuel in their furnaces, and not coal or coal, which is seldom to free from sulphur as to affect the malleability of the metal. It is therefore sometimes preferred to European tin at the Cantoun market; and the profit upon it to the Dutch company is supposed to be not less any year than 50,000 pounds. The tin is delivered by the managers of the mines to the king at Palamabong for five rix-dollars per 255 pounds, and by him to the Dutch for 15 rix-dollars, equal to about 58 shillings per cwt. English. Raynal, and others, state the quantity of tin received by the Dutch company at 2,000,000l, but it appears that they take at least 3,000,000l. Very little, however, comes to Europe; in 1778, 700,000l was sold in Holland at £. 2 per 100l; but the greatest part goes to the China market. Stavronius's Voyage to the East Indies, by Wilcocke, vol. i. p. 357. Stanton's Embassy to China, vol. i. p. 355.

BANCA, Strait of, lie between this island and Sumatra; which, on its eastern side, forms the western side of these straits, and its southern extremity forms the northern side of the straits of Sunda. Through these straits there is a safe navigation from the China sea, except near the northern entrance, where a shoal lies off, and another within it, so that it is necessary for a ship to found in that situation. Capt. Marchand, in endeavouring to gain the entrance of these straits, experienced strong currents, some setting to the E.N.E. others to the E. and others to the E.S.E. He therefore renounced the idea of going out of the China sea by the straits of Banca, and determined to sail by another strait situated more to the eastward, between the island of Banca and that of Billiton. This strait is known under the names of Gaspar's, Billiton's, or Clement's strait; and has been much frequented in palling to and from the China sea. See Marchand's Voyage, vol. i. p. 98.

BANCALIA, a kingdom in the island of Celebes.

BANCALIS, a town of the island of Sumatra, in the kingdom of Acheen.—Alfo, a bay on the north-east coast of this island, in N. lat. 1° 15'. E. long. 106° 7'. 43 leagues west of Malacca; it is in Brouer strait, which is a branch of that of Malacca; is large, and affords good anchorage, and its navigation, as far as Bancalil, at the utmost extremity, is safe.

BANCAPOUR, a district of Hindostan, in the country of the Mahattas.—Alfo, a town of this district. N. lat. 14° 55'. E. long. 75° 15'.

BANCAPOUR, Senore. See SANORE.

BANCK, LAURENCE, in Biography, a Swedish lawyer, was born at Norcopon, and after returning from his travels in France, Italy, Spain, &c. acquired great reputation as professor of the civil law in the university of Franeker, which post he occupied for 15 years. He died on the 12th of October in the year 1662. In 1649, he published a Latin work " On the Tyranny of the Pope over Christian Kings and Princes," and in 1656, "Rome triumphant, or the Inauguration of Innocent X." But his principal work was his edition of the famous book of "The Tax of the Roman Church," in which are fixed the prices of abjuration for the most heinous and infamous crimes. This edition, formed by a collation of the most ancient copies, both printed and manuscript, was printed at Franeker, in 1651; and several other editions have been, before and since, printed at different places. Jurien, in his "Prejeç, es legit, contrle Papine," t. i. p. 257, &c. published the particulars of these taxes. Banck's edition of these taxes, and some others, has been referred to the class of prohibited books, in the "Index" of the Inquisition, as corrupted by heretics; but enough remains in uncontested editions to induce worthy Catholics to lament that such taxes should ever have disgraced the church. Gen. Diet.

BANCK, Peter Vander, an eminent engraver, was a native of Paris, and received instruction in the art of engraving from the celebrated Francois de Polly. About the year 1674, he came over to England, and married; but not receiving recompense answerable to his labour as an artificer, he was reduced to penury, and to dependence on the brother of his wife. He died at Bradford in 1697, and left his plates to his widow, who sold them to great advantage, and left an easy fortune.

His chief employment was engraving of portraits; and he was the first in England who engraved them on fo large a scale. Like many of Polly's disciples, his great merit consists in the laboured neatness and management of the mechanical part of the art. In England his productions will be always esteemed, as they preserve the best resemblance of many eminent persons who were living at that time. Strutt.

BANCOK, BANOR, or BOO, in Geography, a maritime and fortified town of Asia, in the kingdom of Siam, seated on an island formed by the river Menan. N. lat. 12° 1'. E. long. 101° 17'.

BANCOTIE, now fort Victoria, lies on the Malabar coast of India, contiguous to Rajapoor. It has a good harbour, and a great trade for salt, &c. from Bombay, whither it makes returns in cattle.

BANCROFT, RICHARD, in Biography, archbishop of Canterbury in the reign of James I. sprung from a good family at Farnworth in Lancashire, and was born in September 1544. Having finished his education in the university of Cambridge, he rose by quick gradations to very distinguished stations in the church. The Puritans were the objects of his bitter invectives. Accordingly, in a sermon delivered at St. Paul's cross, on the 9th of February 1589, he accused them, in very intertempore language, of ambition and covetousness; alleging that the principal cause of non-conformity and schism was the propert of plundering bishops, feizing the endowments of cathedrals, and frambling for the remainder of the church revenues; and accusing the bating among the non-conformists of an intention to diloloe the bonds of property, and to introduce a community of goods. He strongly represented the danger of permitting private men to contend the authority, and violate the constitutions of the church, exposed the absurdity of extemporal prayers, and maintained the divine right of bishops, in terms which, in the judgment of Sir Francis Knollys, one of the queen's counsellors, were injurious to the supremacy of the crown. This sermon, preached, as Spyke supposes, at the instigation of archbishop Whitgift, furnished ample evidence of Bancroft's inveterate hostility against the Puritans. As one of the composers for ecclesiastical causes, he adopted rigorous measures for the suppression of heresy and schism; and he was an avowed enemy to sects and innovations of every kind. Writings against episcopacy, or recommending any other mode of church discipline, were treated
treated by Bancroft as editors, and he pursued their authors as enemies to the state. His zeal recommended him to ecclesiastical preferment; and in 1637, he was advanced to the see of London, and the management of the ecclesiastical affairs of the kingdom devolved upon him. In the celebrated conference between the bishops and the Presbyterian ministers, held at Hampton court in 1639, Bancroft took an active part; and when the king required satisfaction in the three points of confirmation, abolition, and private baptism, he undertook to explain and vindicate these branches of ecclesiastical discipline, as they were exercised in the church of England. In the prosecution of this conference, and with a view to its speedy termination by an act of authority, he moved the king, that an ancient canon, that "schismatics are not to be heard against Bishops," should be revived; and that, according to a decree of an ancient council, which prohibited any man to plead against his own suffringer, those of the opponents, who had publifhed the communion-book, should be let aside. These absurd and unjust proposals were rejected by the king. When Dr. Reynolds, on the part of the non-conformists, moved for several alterations in doctrine and discipline, the bishop fell upon his knees before the king, praying that care might be taken to provide a praying clergy, as the services of the day were too much neglected, and the duty of a parish priest wholly restricted to the pulpits; that till men of learning could be procured for every congregation, homilies should be read, and their number increased; and that pulpts might not be turned into batteries, from which every malecontent might be allowed to vent his spleen against his superiors. These requests, whether well or ill-founded, were evidently pointed against the non-conformists. Upon the lord chancellor's taking occasion to argue against pluralities, and expressing a wish that some clergyman might have single coats before others had doublets, adding also, that he had bestowed benefices in the king's gift upon this principle, the bishop of London replied, "I commend your honourable care that way; but a doublet is necessary in cold weather." The good bishop, it is said, spoke feelingly, for he had himself experienced the comfort of warm clothing. In 1664, bishop Bancroft was elected and consecrated to succeed archbishop Whitgift in the see of Canterbury; and in this high station he retained his intolerant principles, and pursued the same measures against the non-conformists. To this purpose lord Clarendon (Hist. vol. i. p. 83.), in his eulogy, testifies, that "if he lived, he would quickly have extinguished all that fire in England, which had been kindled at Geneva, and would easily have kept out that infection which could not afterwards be so easily expelled." For the rights of the church, the archbishop manifested a jealousy, which involved him in a contile with the judges; against whom he exhibited to the lords of the council, complaints of their encroachments on the ecclesiastical courts in granting prohibitions; but these complaints were over-ruled by the unanimous opinion of the judges, which Coke justly calls the highest authority of the law. In the interior discipline of the church, the archbishop was rigorously exact, urging a strict conformity to the rubric and canons, and making no allowance for diversity of opinion. He enforced injunctions to the articles in the most unseasonable terms; and it appears, that, not long before his death, forty-nine clergymen were deprived of their benefices for not complying with his rigid regulations. In 1610, he proposed to parliament a plan for increasing the revenues of the church, by improving the tithes, redeeming lay appropriations, and restoring the practice of mortuaries by repealing the statute of mortmain. Parliament wisely refuted this project, which seems to have been the last public act of the archbishop's life; for he died of the stone, at his palace at Lambeth, in November 1610, aged 67. His library was bequeathed to his successors in the metropolitan see of Canterbury. Besides his sermon against the Puritans, we have only two tracts, written by him before his advancement to the episcopal dignity, in defence of the church against the non-conformists, intitled "Dangerous Positions," and "Survey of the pretended holy Discipline." The prominent features in the character of this prelate were intemperate zeal and intolerant severity; and if he rendered any services to episcopal policy, the general caule of Protestantism owed him little obligation; for nothing could be more inconsistent with the fundamental principle of the reformation, than the restraint and prohibition of that freedom of judgment and choice in the province of religion, which had been affected and maintained by the predominant party on their separation from the church of Rome. Bancroft, however, though his principles were narrow and temper rugged, possefl ed a degree of understanding and of activity of spirit, which fitted him for public business, and which enabled him to occupy important stations in the church with a considerable degree of reputation. A letter written by this prelate to king James I., in vindication of pluralities, is preferred in the advocate's library at Edinburgh, and may be read in the first volume of Sir Dalrymple's Memorials. Biog. Brit. Gen. Biog.

BAND, in a general sense, some small, narrow ligament, wherever a thing is tied or fastened.

We say, a fly-band, a brow-band, a hat-band, &c.

Band, in Architecture, denotes any flat, low member, or moulding. This amount to the same with what is otherwise called fascia, from the Latin fines, which Vitruvius uses for the same thing, and sometimes fillet, plint, &c.

Bands of Columns, properly denote a kind of embellishments surrounding shafts of rustic columns, at certain distances, by way of decoration. These are sometimes plain, sometimes picked or vermiculated, and sometimes carved with decorations of low relief, which are different in every different band.

Columns enriched with these bands, are sometimes called banded columns.

Band, in matters of Artillery, denotes a hoop of iron used about the carriage of a gun.

Such are the nave bands, which are iron hoops binding the nave at both ends.

Band, in Geography, a town of Persia, in the province of Mecran, 400 miles S.S.W. of Candaubar.

Band, Bandum, is used, in Middle Age Writers, for a flag or banner.

Band of Soldiers, in Military Language, so many as fight under the same flag or ensign. Thus Romulus called those who fought under the same name manipule (a handful of hay being then used for a flag) manipulus militum.

Formerly bands especially denoted bodies of foot; and the French formerly called their infantry bandes Francaises.

Band of Pensioners, is still retained, to denote a company of gentlemen, who receive a yearly allowance of 100l. for attending the king on solemn occasions. See Pensioners.

Bands, Trained. See Trained Bands.

Band, gives the denomination to a military order in Spain, instituted by Alphonso X. king of Castile, in the year 1332. It takes its name from bands, band, or red ribband, which comes across over the right shoulder, and under the left arm of the knight. This order is for none but the younger sons of nobles; the eldest sons of grandees are excluded; and, before admittance, it is requisite to have served at least ten years, either in the army or at court. They are bound to take up arms for the Catholic faith against the infidels.
The king himself is grand-master of the order. 

**Balm of Saddle**, denote two flat narrow pieces of iron, nailed on each side the bow of the saddle, to retain those bows in the situation which makes the form of a saddle. 

**Band, to put a bow in the**, is to nail down the two ends of each band to each side of the bow. 

Besides the two great bands, the fore-bow has a small one called the wither-band, and the hinder-bow another to strengthen it. 

**Band, in Surgery**, is a long strip of linen, or some other convenient material, intended for the purpose of binding and surmounting any part of the body. When a band has been rolled up for use, into a cylindrical form, it is generally denominated a **Bandage or Roller**. 

**Banda**, in Geography, the chief island of a group, which comprises five others, lying close to one another, and situated in the Eastern Pacific ocean, east of Celebes or Macaffar, south of Ceram, and south-east of Ambonay, in about 8° lat. 5° 45'. E. long. 120° 30'. These islands are called the **Spice or Nutmeg islands**, and also Banda islands from the name of the principal of the group. Banda formed the second government of the Dutch to the eastward. The first of the chief islands is Neira or Nera, where stands the chief settlement of the province; it has a spacious and commodious harbour, but difficult of access; ships anchor under the cannon of two forts, called Belgica and Nappa, the first standing on an eminence, and commanding the whole extent of the island and of the harbour, as well as fort Nappa; the defence of it would require a garrison of 400 men, and yet the whole number of military in all the islands scarcely ever exceeds 300. The next island is that of Banda, Lantor, or Lanthoir; it does not exceed eight British miles in length from west to east, and the greatest breadth at its eastern extremity may be five; it has a fort and two or three redoubts. The third and fourth in importance are Pulaway or Way, and Pulo-run or Rohan: upon the first of which is a small fort, and upon the other a redoubt. The other two are Rozingen or Roffigen, in which there is a redoubt, and to this island the Dutch company often banish their flate prisoners; and Gunung-api, Gannong, or Ganapex, which has a volcano constantly emitting smoke, and often flames. The nutmeg-tree is chiefly cultivated in Neira, Gannong, Ay or Way, and Lantor or Banda; and it flourishes not only in the rich black mould, but even amid the lavae of Gannong, which is the highest isle, the summit being 1940 feet above the sea. When the English admiral Raimier took possession of the island of Ambonay and Banda, which he seized without resistance, in February and March 1796, the annual produce was about 165,000 pounds of nutmegs, and 45,000 pounds of mace. The hurricane and earthquake, in 1797, almost annihilated the nutmeg-trees in Banda, so that the Dutch have become the dupes of their own avarice. From 1796 to 1798, the English East India company imported 817,312 lbs. of cloves, 93,732 lbs. of nutmegs, and 46,570 lbs. of mace, besides considerable quantities of each in private trade and privilege goods, amounting to about a third part of the above. The ground being chiefly occupied with these precious productions, cattle and grain, &c. are imported from Batavia, at the distance of three or four weeks' sail. The inhabitants of the Banda isles were found to be 5762. The English were expelled from Lantor and Rohan, at a period prior to the massacre of Ambonay; but seizing the whole Spice islands in 1796, and reduced them to their Batavian masters by the treaty of Waitoa in 1801.

To the government of Banda belong likewise several other islands in the neighbourhood, known by the appellations of the South-eastern and the South-western isles. Their inhabitants are in alliance with the company, and furnish a considerable quantity of provisions, confounding of wild-boars, flags, sea-cows, and other articles of food, which they barter at Neira for piece-goods and other necessaries. This trade, however trifling, is very beneficial to the inhabitants of Banda; and it is supposed, that the province would derive greater advantages from it, if the company would allow Neira to become a more commercial place; but this is prevented by the sanguine policy of the government. Stavrius's Voyages, by Wilcocke, vol. i. p. 331. vol. ii. p. 418. 

**Banda, Ican landa Ruyfch. Theat. bandasche curatuoba** and **Ikan bandina Jang. Swapti, Valen amb. banda Ican Potoa, banda Renard Ptc. in Iohannbelie, synonymous names of the species of Coryphantha, called by Genulin janudalbyle. 

**BANDAGE, in Surgery, is a Strip, a Filler, Swathe, or Band, applied to its peculiar use upon any member, &c. of the body. The nature and application of bandages are a study of considerable importance in Surgery; for it often happens that the cure of a local disease depends principally or entirely upon the proper management of them. Their substances and forms are various, according to the nature of the case, and the intention to be fulfilled in their application. They may be made of linen, flannel, leather, or cloth composed of different materials. Each of these substances, on particular occasions, has its respective advantages or disadvantages. 

**The common properties and uses of bandages are—**

1. To retain parts in their situation.
2. To separate or keep them athered.
3. To expel morbid fluids, or prevent their accumulation.
4. To confine dressings or external remedies.
5. To compress and obliterate certain vesicles.

The bandages must in use are made of linen or cotton.

The linen used for this purpose must have been already worn, but still sufficiently strong, cut according to the direction of the threads, and without seam. In order to prevent its unravelling, the edges may be slightly fitched round, but it ought to have no seams whatever.

As it is often impossible to procure long bandages of a single piece, and we are consequently obliged to form them of several different pieces, they should be sewed together with back-stitches, leaving ends several lines in breadth, which must be doubled round and heat perfectly smooth and even. But in order to avoid all the inconveniences that attend the use of bandages made of linen, it will be best to ufe fillers of linen expressly manufactured for the purpose, which may be woven of different breadth and lengths. 

Bandages are distinguished into **single bandages**, which consist of a single piece, and **compound bandages**, which are composed of several different pieces, and whose application requires greater trouble and skill. They are also divided into **general bandages**, or such as may be applied to several different parts of the body, and **particular bandages**, which are adapted only for one particular part.

Every single bandage consists of a beginning, middle, and end. The beginning and termination are named its **end**; and when the bandage is rolled up, they are called **bands**. The middle part of the bandage is called its **body**. When we roll up one end of the bandage to the other, we have a **single-headed bandage**; but when we roll up each end separately only towards the middle, it is then called a **double-headed bandage**. In order to apply any bandage properly, it is necessary that it should first be rolled up tight and perfectly even. The operator, when he applies it, holds its **body** between his **thumb and fore-finger of one hand, in such a manner that it lies directed upwards in the hand, and the end that has been rolled off is held down with the other hand upon the part till it is sufficiently secured by several turns. In rolling out the bandage, the head must run as close
close as possible to the diseased part, and constantly be turned towards the surgeon; the bandage should never be rolled out too far, and the head should be held neither too tight nor too loose. When we wish to remove the bandage again, we should not pull it forcibly off from any part to which it may adhere, but previously moisten it with warm water. It is then cautiously drawn off from the diseased part, and, in winding it off, that part of the bandage which has been rolled off is alternately shifted out of the right hand into the left, and vice versa.

To the simple bandages belong the circular bandages, the fiddle bandage, the retaining the expellent, the creeping, and the uniting bandages. To the compound bandages are referred the eighteen-headed bandage, the many-headed bandage, the T bandage, and in some measure also the 'Tournez.' Some bandages receive their appellations from the names of the parts to which they are applied: thus, bandages for the head, eyes, ears, nose, neck, breast, back, belly, &c.

The eighteen-headed bandage may be formed of several (suppose three) pieces of linen, about a foot in length, and ten or twelve inches in breadth, more or less according to the length and thickness of the limb, and all three are laid at the middle of each other. At the middle they are sewed together longitudinally, after which each of them is cut through on each side, till about two fingers breadth from the middle, into three equal parts, which form nine heads on each side. But as in this mode one head covers the other, there always remains a slit between the heads, by which means the limb is unequally pressed upon and secured. This defect may be remedied by arranging the cuts in such a manner that the heads of the middle piece of linen are always covered by a slit and the half of two heads of the other pieces of linen. This will be the case if, as Loeffler advises us, we give the first piece of linen four, the second three, and the third again four heads. See the Many-headed Bandage.

In cases of compound fractures, in which the bandages are frequently foiled, it will be more convenient, as Daffault advises, to use a bandage confiding of eleven separate fillets of linen, each a foot and a half in length, and four fingers broad. Four of these are to be laid at the bottom, three in the middle, and again four at the top, at the side of each other; and thus we obtain a twenty-two headed bandage of a more convenient composition. This bandage may still be improved by cutting the middle fillets shorter than the lowest, and the upper shorter than the middle; by which means the bandage will apply farther to the part. Should now any of the fillets be foiled, we have the advantage of being able easily to substitute another in its place; for we need only to sew the new fillet to the old one, and draw it by means of the latter through between the rest, without deranging any of the other parts of the bandage.

The Circular Bandage. This bandage may be of various lengths and breadths; it is rolled upon one head, and is used for securing small dressings, such as lint and compresses. It is applied in such a manner that one turn entirely covers the other, so that only the last turn is visible.

Ruinative Bandage. This is a common simple bandage, which is used for retaining dressings in their proper situation; and it is applied sometimes with circular, sometimes with spiral, and sometimes with creeping turns.

The Neck Bandage. A fillet, two feet or two feet and a half in length, is laid across over the head in such a manner that the ends reach down on both sides to the shoulders; and over this other fillet, five or six feet in length and two or three fingers broad, is rolled round the neck with circular turns. The two ends of the first fillet are then doubled back to the head, and securely to the circular turns with pins; by which means the circular turns are prevented from slipping off, an accident that is particularly to be apprehended when the neck is long.

Doubtful Bandage, to support the head, is formed with a small fillet, which is laid over the head in the direction of the sagittal plane, so that one end hangs over the nose down to the breast, and the other over the back of the neck till between the shoulders; and another larger inlet, fifteen or eighteen feet long and three fingers broad, which is rolled upon two heads. The middle part of the latter is laid upon the forehead, over the first fillet; it is then carried over the ears round the head, to the back of the neck; its heads are then shifted to opposite sides, brought forwards under both axillae, then carried backwards over the shoulders, crossed again, carried under the axilla over the breast, the head's shifted again, and the rest of the bandage rolled round with circular turns. The surgeon then takes hold of the two hanging ends of the small fillet, carries them back over the head, and there pins them together, or to the other turns, after having drawn the patient's head straight.

The Expulsive, or Distended Bandage. This is a common simple bandage, the length and breadth of which are to be regulated according to the purpose for which it is to be used. It is used in cases of huldas, and wounds made with pointed instruments, in order both to force the pus and blood towards the orifice, and thus expel them from the body, and also by bringing their inner surfaces into contact, to promote their healing up. Before the bandage is applied, all the fluids must be expelled out of the wound, ulcer, or fistula, by rubbing, prickling, or throwing injections into it. When this has been done, compresses of various dimensions are applied along the course of the fore, and particularly at the region of its bottom; and generally it is necessary to have compresses that are graduated at one end, the thickest part of which is applied over the bottom of the fore, and the thinnest over its orifice. An affiant holds the compresses fast in their proper situation, whilst the surgeon applies a single or a two-headed bandage, according to the situation of the ulcer. He commences the application over the bottom of the compress, so as to secure and press it down by two or three turns of the bandage, which he then carries towards the orifice with spiral turns; after which he carries it back again, and finishes with spiral turns. This mode of bandaging may also be used with great advantage in cases in which a flap of flesh has been partly cut off from the body, whilst it still remains attached by one part, in order to make it heal up again in its proper situation; and in such cases the bandage becomes an unrolling one. But when we apply it in this manner, we ought always to be careful to make a sufficient and equal pressure at every point; for otherwise our intention, if not entirely frustrated, will at least be impeded, and the cure prostrated.

Galen's Bandage. The four-headed or flinging bandage for the head. This bandage is formed of a piece of linen three or four feet in length, and from four to eight fingers broad, both ends of which are cut off as far as to leave the middle part about eight fingers broad. It is generally applied with the middle part straight upon the head, so that the anterior ends hang down over the cheeks, and the two others over the ears; and in order that it may lie more firmly upon the head, the edge of the middle part that lies over the forehead, as well as that on the back of the head, is doubled round, so as to form a kind of seam. The two anterior ends of the bandage are then carried over the ears, and fastened at the back of the neck; after which the two posterior ends are carried in the same manner over the ears, and fastened under the chin. The bandage may be applied in a similar manner upon various parts of the head, only it is to be...
be observed, that the central portion must always be placed over the diseased part, and the ends carried in opposite directions, either crossed or stretched out.

The Uniting Neck Bandage. This bandage is formed in the following manner. The surgeon takes a napkin four double, lays it under the patient's axilla, and pins it together in the front of the breast. He then takes two pieces of linen, fold each one of them to the patient's night-cap, and the other to the napkin, in such a manner, that if the wound be situated in the trachea, or at the fore-part of the neck, the ends, after the patient's head has been inclined forwards a little, can be fastened to the fore-part of the cloth, in order to keep the head in that position. But should the wound be situated in the back of the neck, the head may be inclined a little backwards, and retained by the same bandage in that position, by drawing the ends of the two small fillets more backwards, and fastening them there to the napkin.

The application of the T bandage, according to Mr. Evers's method, is however more advantageous, especially for uniting wounds across the throat. For this purpose, we are to take a fillet, three fingers broad and ten feet long, and few to the middle of it another of equal breadth and six feet long, so as to represent the figure of the letter T. The smaller fillet is now to be flit open all but one foot. In applying it, the part at which the two fillets are fewed together, is placed upon the back of the neck in such a manner that the smaller fillet lies over the back of the head upon the vertex. The two heads are next brought forwards over the shoulders, then carried under the axillar, which are guarded with compresses, to the back; the bandage is then crossed, brought forwards again upon the breast, and fastened. The flat ends of the smaller fillet are next crossed over the vertex; after which they are carried over the face under the axillar; the patient's chin, if necessary, being drawn downwards towards the breast, and this fillet is finally fastened like the former. Mr. Koehler has propounded for this purpose a leather cap with fraps, by means of which the patient's head may be drawn into any position that may be necessary. See the T Bandage.

The Inguinal Bandage. The bandage for luxations of the os femoris. This is a bandage eight or nine yards in length, and three or four fingers broad, rolled up into one head.

The Six-headed Bandage of Galen. This bandage consists of a piece of linen from three to four feet in length, and 8—12 fingers broad; its breadth and length being determined according to the size of the patient's head. The cloth is folded in such a manner that its breadth can be divided into three equal parts, and these parts are flit open from both sides, so far as to leave entire in the middle a space of the breadth of a man's hand, by which means fix heads are formed. It is applied nearly in the same manner as the four-headed bandage for the head.

The many-headed Bandage. This bandage is formed of a piece of linen or flannel, the dimensions being regulated according to those of the diseased part, into which a number of fillets are made at both sides, so as to leave only one part entire in the middle for the purpose of connecting the tail. In applying it, the whole piece is laid under the diseased part; the lowest of the ends, which lies on the outer side, is then brought obliquely upwards on the inner side, and that which lies within is brought obliquely upwards on the outer side, and so on; so that the lower ends are always half covered and secured by the upper. A many headed bandage may also be formed in another way, by cutting a piece of linen or flannel into several strips, of which the one is always longer than the other, but each of the same breadth with the rest. The shortest is generally made a foot, and the longest two feet in length. All these strips are now laid over each other in such a manner that always half the breadth of the one is covered by the other. To secure the whole, a narrow flit of linen or tape is sewed to them behind and also in the middle. In applying it, the narrowest part of the bandage must always come to lie over the smallest part of the limb. A bandage of this kind will perform the functions of the belt applied circular or spiral bandage, and it applies to the parts far better than the eighteen-headed bandage; on which account it may be used instead of the latter.

The T Bandage, the bandage for the flitula in ano. This is a common compound bandage, which is chiefly used in lesions of the neck, the breast, the abdomen, the back, but particularly the general organs, the anus, the groin, and the perineum. It is either single or double. The simple T bandage is formed in the following manner: take a fillet from four to eight feet in length, and fold it together in such a manner as to get the exact middle point. At this middle point few to it another fillet in a perpendicular direction, and of such length as may be most convenient for the purpose for which it is intended. To form the double T bandage, either two fillets are sewed in the middle obliquely beside each other, or a whole piece is sewed on and afterwards flit open. According to the dimensions of the place to which it is to be applied, it is made more or less broad.

The Creeping Bandage. This is a common simple bandage rolled upon one head, which is applied in a spiral manner round the limb, so that the one turn does not cover the other, but only lies close to it, in such a manner that no part of the limb remains visible. It may sometimes be used for securing compresses and other dressings.

The Scapulary and Napkin. This bandage consists of a napkin, and a scapulary as it is termed. The napkin is folded together, and rolled upon two unequal heads; the middle part is then applied under the arm in such a manner that the larges part is carried over the back, and the smaller over the breast; but both heads are laid over each other, and then fastened. But in order to prevent the napkin from falling out of its situation, the scapulary is required. This is formed of a piece of linen 2—4 feet long, and half a foot broad. In the middle of the piece a flit is cut, large enough for the head to pass conveniently through it; and in this manner one end hangs down before over the breast, and the other over the back. These two ends are then fastened to the napkin before applied. We may also flit open the ends, and thus attach them more extended to the napkin, by which means they will support it better. This bandage may be used in almost all lesions of the breast, as also in simple wounds of the abdomen.

The Spiral Bandage. This is a common simple bandage, the length and breadth of which must be adapted to the dimensions of the part; the second turn of the bandage always covers the first, and the third and following turns always cover each the preceding turn, either half or a little more, so as to represent a spiral figure. The turns may be made either from the upper towards the lower part of the limb, or from the lower towards the upper; in the first case it is termed the descending, and in the second, the ascending spiral bandage. It is generally applied in the last-mentioned manner, and may be used for swathing whole limbs, by which means alone very obilinate diseases may sometimes be cured.

Mr. Theden (Neue Bemerkungen u. Erfahrungen, &c. Th. I. Berl. 1761, p. 1.) was the first who called the attention of the public to the more frequent and rational use of swathing with this bandage; and experience has proved that this practice may certainly be attended with very great advantages. In applying it, every thing depends upon the whole limb being entirely encircled with it from the
the very points of the fingers or toes, so as to leave no part whatever bare, as a tumor would be produced in such a part. The method of applying it to the superior extremities is as follows:—For each finger we are to take a fillet a foot in length, and of the breadth of a finger, and wind it round each finger as well as the thumb in the following manner. The fillet turn is made circularly round the point of the finger, the second, in order to afford a good hold for the ret, immediately over the fillet; the third turn covers half or a little more of the second, and the fourth and following turns the same. The ends of these fillets are laid upon the back of the hand, and secured with a fillet from 20 to 30 feet long, and 2 or 3 fingers broad. With this long fillet, the fillet turn is made immediately over the fingers round the hand, and for the sake of security, the second straight over the fillet; but the following turns always cover each one half of the preceding turn, and they ascend as high as the elbow, being applied neither too loose nor too tight; for we must always have in our power to introduce a finger between the turns in case of necessity. If we intend to wet this bandage with any liquid, we must apply it somewhat looser, as it contracts and becomes tighter when it is moist; but afterwards it must be kept constantly moist, as otherwise, when it dries, it becomes too loose, and is consequently rendered useless. Should the person who applies the bandage, not know how to hit the proper measure of tightness in this case, he may wet the bandage before he applies it.

These turns are carried up as high as the elbow, where, if it be a case of injury from blood-letting, a piece of rag spread with a proper ointment is laid upon the inflamed or ulcerated part, and the bandage is carried two or three times up to the humerus, and back again, so as to form turns like ∞ ∞, as in the operation of blood-letting. If we cannot cover every part by means of these turns, we may lay an oblong piece of linen, 3—4 fingers broad, and a foot long, under the elbow, draw it tight, and secure it above and below with the bandage. The end of the piece of linen that projects under the bandage is doubled back, and another turn made round it, in order to prevent its giving way. The turns are then continued as high as the deltoid muscle, or to the shoulder, and the end of the bandage is fastened to the neck. When the tumor grows smaller, fat is to render the bandage too loose, it may be renewed. In swathing the lower extremities, it is not necessary to bandage each limb separately, and this would also be very difficult on account of the shortness of these members. We may therefore apply the middle part of a piece of linen, about twice the breadth of a man’s hand in breadth and length, close to the points of the toes, and turn one part over the back of the foot, and the other under the sole; the two folds of the linen are then to be drawn tight towards the foot, and doubled downwards, both at the great and little toe, towards the sole, where they are to be held fast with the left hand. The surgeon then takes into his other hand the bandage, which may he from 30 to 40 feet long, and 2—3 fingers broad, and secures the piece of linen that includes the toes, with two circular turns, after which he proceeds to carry the bandage with spiral turns towards the leg. In order to obviate the difficulty that attends the bandaging of the heel, we may apply under the sole another piece of linen, somewhat more than the breadth of a man’s hand, so as to reach above the heel, surround it with the bandage and draw it tight, then double down the ends, and secure them with the bandage in order to prevent their giving way. For the greater security of the bandage, and in order to prevent the pain which it might occasion by its pressure upon the Tendo Achillis, we may fill up the depressions on both sides of the tendon, as high as the termination of the calf, with lint, whilst we are bandaging the limb. As often as it is necessary, namely when any turn is not drawn so as to cover half of the preceding, we must turn the bandage, and this must be done particularly under the calf. When the limb has been swathed, a flocking that fits well should be drawn over it.

**Stellated Bandage with Two Heads.** This bandage is used after blood-letting at the temporal artery. It is from 16 to 20 feet long, two fingers broad, and rolled upon two heads. Instead of this bandage Mr. B. B. L. recommends the use of a well-hardened feel spring, three quarters of an inch broad, and twelve or fourteen inches long, which is covered with soft leather, and of equal strength with the spring of a rupture bandage.

**The Single Star Bandage.** This is a one-headed bandage, from sixteen to twenty-four feet long, and four fingers broad, which is used in some affections of the fœnus.

**The Double Star Bandage.** This bandage is 3—4 fingers broad, 24—32 feet long, and rolled upon two heads: it is likewise used in leisons of the fœnus.

**The Bandage for an Umbilical Hernia.** These bandages may either be elastic or non-elastic. With infants an elastic bandage is both troublesome and superfluous. Mr. Richter therefore recommends to apply half a nutmeg, wrapped in a piece of linen to the umbilicus, and to secure this with a single adhesive planter and a circular roller. But lest the bandage should slip, and the planter together with the nutmeg fall off, he directs the front part of the bandage to be made almost as broad as the hand, and that which lies upon the hips two thirds narrower, in order that if it should slip a little upwards or downwards, it may still in some degree help to retain the piece of nutmeg in its place. In order to prevent the bandage from wrinkling, it is made of double linen, and at the front part which covers the navel, a piece of leather is inserted between the two pieces of linen; by which means this part of the bandage constantly preserves its proper breadth. When we wish to change this bandage, we should introduce a finger under the bandage, and press down the nutmeg upon the navel till the bandage has been applied, left the navel should again be protruded. Instead of the nutmeg, we may employ for the same purpose a set of graduated compresses, or any other proper hard substance. See the article **Rupture.**

**An umbilical bandage for the umbilical hernia in adults is made in the following manner.** We take a piece of parchment four or five feet long and four fingers broad; and cut into the middle of it a slit a foot long, which passes over the patient’s head when it is applied. To the one end, at both corners, two straps are sewed, which run on in a straight line with the whole. Two other straps are sewed immediately over the former to the margin of the bandage, so that when the whole is laid upon a horizontal surface, they form a right angle with the slit of parchment, on each side. Finally, to the inner side of the bandage a cushion is attached, which is stuffed with horse-hair, cork, or cotton, and in order that it may lie properly, it ought to have a degree of swell round the margin. In applying it, the patient introduces his head through the slit above-mentioned, so that the longer portion of the slit of parchment hangs down perpendicularly over his breast, and the shorter down his back. After the hernia has been reduced, the two upper straps attached to the margin of the bandage are carried round the body and tied upon the back; or if they be long enough, over the cushion in front. The other two are brought through between the thighs, and fastened at the back to the slit, or to the upper piece of parchment or linen. But
But as the hernia is not always of equal size, being smaller in the morning, and larger after meals, and as it alternately rises and sinks in inspiration and expiration, it is evident that these elastic bandages cannot adapt themselves to these diversities, as they either render necessary a stronger, inconvenient, and often hurtful pressure, or do not press sufficiently, so that the hernia is constantly in danger of slipping through.

With adults therefore we can expect no security, except in the use of elastic bandages for the umbilical hernia; and of these there are simple, compound, and double bandages. The simple bandage consists of a somewhat broad, round, or oval cushion, and an elastic band. With patients whose umbilical region is more debilitated, an oval cushion is requisite, having in the middle a small hole of the size of a walnut, which comes to be upon the navel. Mr. Richter also recommends the use of a common bandage for the inguinal hernia, provided in its front with a field, to the inner side of which a cushion is attached. However, this and the above-mentioned rupture bandages are not sufficiently secure against slipping out of their situation, on account of their being provided only with a single hand spring.

Mr. Theden has proposed the use of elastic gum for bandages for the umbilical hernia; and Mr. Juville thinks that it may be sufficient with patients that are not corpulent, and when the hernia is small. But as elastic gum loses its elasticity when it grows warm, it has been proposed to superpose its use by the application of spiral steel springs to both sides of the cushion. However, both these methods are liable to the objection, that they produce the same pressure upon the whole surrounding part of the abdomen, as they do upon the navel itself; and consequently the cushion either does not compress the navel sufficiently, or it presses it more than is necessary.

A better bandage than these, for the umbilical hernia, is that of Squire, which consists of a plate, with a cushion screwed to it, and two lateral springs proceeding from the plate, which, when it is applied, firmly embrace the body. An elastic bandage of another kind is that of Surer crucis, which Mr. Richter (Abhandlung van den Bruechen. Göttingen, 1785, p. 641. tab. vi.) has described, delineated, and in a high degree improved. Two bandages of Mr. Juville for umbilical hernia, of which one is described and delineated by Mr. Bell; and the other by Mr. Hofer. (Lehrfuecke des Chirurg. Verbandes. Th. II. Erfurt-1791, tab. x. fig. 77.) Dr. Alex. Mono, senior, has also described a bandage, confining of a steel spring, which, after the hernia has been reduced, is placed upon the navel, and retained in this situation by a bandage. It is drawn as tight as may be necessary by means of straps and buckles.

When, as sometimes occurs, the hernia has formed adhesions, either spontaneously, or on consequence of improper bandaging, in which case its reduction is altogether impracticable, we must use a concave cushion, instead of a convex one, that may receive the hernia into its hollow, and prevent the farther protrusion of the intestines. If the bandage be skilfully constructed, the adhesions may gradually be diminished, and the hernia at length reduced.

The uniting Bandage. This is a common double-headed bandage, and one of the most useful and indispensible which is used in cases of fresh wounds, in order to promote their speedy re-union. Properly it is only adapted for such wounds as run in the direction of the body and limb, and that are situated in parts which admit of the application of a bandage; however, it may also be used in cases of transverse wounds; but then it rather belongs to the compound bandages. It may be formed in different ways: viz.

1. According to one method of forming it, its length must be regulated by the circumference of the wounded part, and its breadth must be equal to the length of the wound. In general, however, it is rather used narrow than broad, and it must always be so long that the wounded limb can be three encircled with it. In the middle part it must have a large slit, through which the head of the bandage rolled up may easily be passed. In applying it, the surgeon takes one of its heads into each of his hands, applies that portion of the middle part that is not slit to the side of the limb opposite to the wound, brings the heads round the limb towards the wound, passes one of the heads through the slit, over the wound, and then the heads in such a manner as to bring the lips of the wound together; after which the one head is rolled round the limb above the wound, and the other below it. When the wound is deep, a longuette is applied under the bandage to each of the lips of the wound, at some distance from its edges; the thickness of these longuettse must be proportionate to the depth of the wound, and by means of them the bottom of the wound is pressed together when the bandage is drawn tight.

When the wound is very long, we must either apply several bandages, one at the side of the other, or make several slits in a single bandage, and pass the head through the second slit over the first turn, and there draw the lips of the wound together, and so also the second and the third time. In this case it will be best to make the slits whilst we are applying the bandages, namely, at the place where the two heads meet each other, as otherwise they do not fit accurately to the wound. The application of this bandage, however, requires great accuracy. If it be applied too tight, it excites pain, swelling, inflammation, and frustializes the purpose of reunion; but if it be applied too loose, the lips of the wound do not come into contact with each other, and the re-union is not properly effected.

2. Another more convenient bandage which is equally applicable to longitudinal and to transverse wounds, is that which has already been recommended by Mr. Henkel. (Anwendung zum Verbiess. Verbande, Berlin, 1767, 8. p. 237. Tab. XV. fig. 104.—Albo Richter's Anfangserudnisse des Wundzuruzynb. B. I. Tab. I. fig. 2.) It consists of four strips of linen, each of which is from one to two feet in length, and two or three inches in breadth. The dimensions, however, must always be regulated according to those of the divided part. Thrice four pieces are united by means of thefix narrow straps in such a manner, that all the six straps cross each other like the fingers of the hand when folded. In this manner we obtain a four-headed bandage, in which the six narrow straps form the centre of the whole.

When it is applied, the narrow straps, or the middle of the bandage, must be placed directly over the wound, and two of the heads must lie on each side of it, in such a manner that the one entirely covers the other. First, the two lowest heads on each side are fastened quite close round the limb with circular turns. The two heads above are then also first drawn tight with both hands, and then fastened in the same manner as the former. When this bandage is used, we have constantly a view of the wound, as the narrow straps lie immediately over it.

3. Mr. Eottcher (Aufenthalt des chirurgischen Verbandes, Berlin, 1795. p. 62. § 71.) has also recommended a very simple bandage for promoting the re-union of longitudinal wounds. He takes a common two-headed bandage, two or three fingers in breadth; and first applies to each side of the wound, at the distance of from half an inch to three inches from the edge, a longuette, which in the mean time is held by an assistant; he then takes one of the heads into each hand, and makes the beginning with the middle of the bandage, on the side of the limb opposite to the wound.
The two heads are now brought over the loutigettes, and in the same manner also over the wound; but this must be done in a very loose manner. The heads are then shifted into different hands, and drawn tight, by which means the longuettes are brought together, and the wound united. The two heads are then flung round each other, over the middle of the wound, then shifted again into different hands, and carried back in the same manner as they were brought forwards to the wound. This turn may be repeated three, four, or more times, according to the size of the wound. The ends are then either entirely wound off in circular turns, or should they not be long enough for that purpose, pinned to the other turns.

Should no unfavorable symptoms supervene, the untang bandage may be left to remain in its situation, five, six, and, if the wound be deep, still more days. Great accuracy, however, must always be used in applying it, as the wound is to be united from its bottom; and the dimensions of the longuettes, or compresses, must also be regulated accordingly; for with deep wounds they must be thicker, and with superficial wounds thinner. When the wound is entirely superficial, none are required. When the bandage is removed, the part must be retained precisely in the same position that has been given to it, and the new bandage applied in the same manner as the former. Even after the wound has completely healed, it will still be proper, by way of precaution, to leave the bandage in its situation for some days longer.

The Bandage of the Patella featured longitudinally. For this purpose is required a bandage from sixteen to twenty-four feet long. three fingers broad, and rolled upon two heads. When it is applied, the hollow of the knee must be boldered with compresses, and a small longuette, about half an inch thick, laid on each side of the knee-pan. The middle part of the bandage is then laid upon the hollow of the knee, and both heads brought forwards; a slit is then cut into the one part, through which the head of the other is passed, in such a manner that the slit fits to the middle of the knee-pan, after which the bandage is drawn tight transversely. The heads are then carried backwards, but obliquely, so that one comes to be situated higher than the other; and the bandaging is completed with circular turns. In order to keep the leg constantly extended, a well-boldered ferula or splint is laid into the hollow of the knee, which may be fastened there by the last turns of the bandage. For greater security, the leg may also be inclosed in a box properly lined, which reaches as high as the thigh.

We do not here profess to give an entire treatise on Bandages, but only an account of those which are most commonly used. Several authors, both ancient and modern, have discoursed on this subject very amply. In particular, we recommend the treatise of Vindex Vindius, for the opinions and practice of the oldest surgeons, which he has translated from the original Greek, and elucidated by various figures: edit. Lutetiae Parthorum, fol. 1544. Among the moderns, the best writers on bandages are Mr. Sive, Thulliae, Heider, Lombard, and Bernein; but all of them are too prolix and tedious, especially the French authors.

Mr. John Bull of Edinburgh has endeavored to simplify this study in his first volume of "Principles of Surgery;" there is, however, a very singular declaration in that part of Mr. Bull's book, viz. "Thos. innumerable forms in which the ancients turned the roller round the head, neck, and body." Says he, "are to be found in the treatises of Socrates, Glorus, Diocles, and Galen. In their treatises I find nothing but what has fallen into decayed and out of nothing that I could mention either for your amusement or instruction." See page 129. Now it happens in this instance, if not in some others, that Mr. Bull has never perused the authors whom he quotes; for no treatises of the kind alluded to, by Socrates, Galen, and Diocles, have ever descended to their posterity. Galen, indeed, wrote on bandages, and his observations are translated by Vitalis Vitalius, in the collection we have already referred to; but certainly Mr. Bull has had no access to copies of any familiar works by the three former physicians.

BANDAL, or BANDELLO, in Commerce, the name of a measure used in the fourth of Irelund, which is somewhat more than half a yard, by which coarse narrow linen is sold in the markets; whence it is called bandaleer.

BANDALEER, BANDELLO, or Bandler, a large leather belt, thrown over the right shoulder, and hanging down under the left arm; worn by the musketeers in the time of James and Charles 1st, both for the fastening of their fire-arms, and for the carriage of their muskett-charges; which being put up in little wooden, tin, or leathern cylindrical boxes, were hung, to the number of twelve, to each bandleer. Each of these boxes contained a single charge of powder.

The word is originally French, bandouiller, formed apparently from bandouiller, a kind of banditu partiicularly infecting the Pyrennes, who were formerly distinguished by this piece of furniture; and were themselves so denominated, gest van de volleurs, a kind of robbers.

The French soldiers still retain the bandaleer; their horse, their musketeers, and common guards, wearing it indifferently; excepting for some difference in its garniture. Grose (Treatise on Ancient Armour, p. 293.) says, this contrivance seems to have been borrowed from the Dutch or Walloons.

BANDAR-MALANKA, in Geography, a town of Hindostan, in the Circars, situated at the mouth of the river Godavery. N. lat. 16° 25'; E. long. 82° 26'.

BANDE', or in Brux., in Heredity, expresses the position of a lion, when he is placed diagonally in the shield.

BANDED, a term applied to a garb, or wheat, &c. when the band is of a colour different from that of the garb itself.

BANDELLO, in Geography, a town of Africa, on the coast of the kingdom of Adel.

BANDELL, a town in the kingdom of Bengal, situated on the western arm of the Ganges, or Hougly river. N. lat. 22° 53'; E. long. 88° 32'.

BANDELET, or BANDEL, in Architecture, any little hand or flat moulding, encompassing a column, like a ring; so that which crowns the Doric architrave. It is also called trunca, which Vitrivius uses for the same thing; sometimes fillet, finemen, &c. It is sometimes used for the three parts which compose the architrave, called by Vitrivius, fascia; and which are sometimes also denominated bands or flat bands.

BANDELLO, Matthew, in Biography, bishop of Agen, was born towards the close of the fourteenth century, at Calcediniano of Servia, in the Milanese. He entered into the society of the Dominicans; and after many changes of situation, he settled in France; and in 1550 was nominated by Henry II. to the bishopric of Agen; but he paid little attention to the duties of his office. The time of his death is not exactly known; but he was living in 1561. He was principally distinguished as a writer of novels. His collection was first printed at Lucca in 1554, in three volumes, 400, under the title of "Novelle del Bandello," to which was added another volume, printed at Lyons in 1573. The edition of London in 1740 comprises four volumes 410. In his narrations the author is said to imitate the manner of Boccaccio, and to write in a lively, pleasing style; but he has also copied his model in those licentious freedoms, which were
were no less unsuitable to his office, than offensive to the church. He was also author of a Latin version of Boccacio's story of "Tieto e Gippippo," of eleven cantos, in ottava rima, in honour of Lucretia Gomaga; and of some other works. Nov. Diet. Hillor.

BANDELVELLO, or Old Port, in Geography, the name of a good harbour at the mouth of the river Dora, on the east coast of Africa, in the Indian ocean; about twenty-seven leagues north of Magadara or Magadaxo, on the same coast.

BANDER ABASSI. See Gomberon.

BANDERAS, a large bay of the Pacific ocean, on the west coast of Mexico, in North America; running inland between two points of land, the north point called Tintoque, and the south cape Corientes, with an open entrance, and sufficiently spacious for the accommodation and anchorage of a fleet of ships.

BANDER CONGO, a port town of Asia, on the easterly side of the Persian gulf, and thirty-three leagues west from Bandar Abassi. N. lat. 25° 5'. E. long. 55° 8'.

BANDERE, a town of Hindoostan, in the circuit of Gojud, one hundred miles south of Agra, and forty-four S. S. E. of Gojud.

BANDERET, the name appropriated to the commanders of the militia of the canton of Bern.

BANDEROLE, in Heraldry, is a blazer affixed by small lines or ftirrups immediately under the crook on the top of the staff of a crooner, and folding over the staff.

BANDEROLs, in Military Language, the ornaments which were given to pikes near the point, in order to render their appearance handsome. Thesef sometime had the name of pencells. (See Grose on Ancient Armour, ii. 277.)

BANDEROLL, in Naval Language, a little flag, in form of a guidon, extended more in length than breadth, used to be hung out on the masts of vessels, &c.

BANDEROLLS, in Military Language, an ancient name for camp-colours.

BANDI, in Geography, a river of Africa, in the country of Calabar, in Lower Guinea, which runs into the sea by two channels. There is a town of the same name on an island at the mouth of the river.

BANDINELLI, Baccio, in Biography, a painter of history, was born at Florence in 1497, and became a disciple of Giovanni Francesco Rustico, a good sculptor. He had the ambition to become a rival of Michael Angelo, in painting as well as in sculpture; but hearing that this great master treated his works contemptuously, he laid aside the pencil, and would never afterwards resume it. As a flatuary, he possessed skill and merit, and in that art he deemed himself equal to Buonarroti; however, when he found that the world did not concur with him in opinion, he was much mortified. He died at Florence in 1559, at the age of 62 years. Several of his pupils became eminent artists. The principal of his works are the bas-reliefs of the tombs of Leo X. and Clement VII. at Rome, a St. Peter, a Baccus, the Lacocon, and some figures of some princes of the Medici family at Florence. His drawing is generally correct, and evinces an extensive knowledge of anatomy; but his muscles are too strongly marked, and he is deficient in grace. Argenville, Vie de Sculpteurs. Pilkington.

BANDITI, from the Italian bandire, persons proscribed, or, as we call it, outlawed; sometimes denominated banniti, or forti banniti.

BANDITI, or BANDITI, is also a denomination given to highwaymen and robbers, who infet the roads in troops, especially in Italy, France, and Sicily. Mr. Drydone, in his Tour through Sicily, informs us, that in the eastern part called Val Demoni, from the devils that are supposed to inhabit mount Etna, it has ever been found altogether impracticable to extirpate the banditti; there being numberless caverns and subterraneous passages round that mountain, where no troops could possibly pursue them; besides, they are known to be perfectly determined and resolute, never failing to take a dreadful revenge on all who have offended them. Hence the prince of Villa Franca has embraced it, not only as the safest, but likewise as the safest and most political scheme, to become their declared patron and protector; and such of them as think proper to leave their mountains and forests, though perhaps only for a time, are sure to meet with good encouragement and a certain protection in his service, where they enjoy the most unbounded confidence, which, in no instance, they have ever yet been found to make an improper or a dishonourable use of. They are clothed in the prince's livery, yellow and green, with silver lace; and wear likewise a badge of their honourable order, which intitles them to universal fear and respect from the people.

In some circumstances, these banditti are the most respectable people of the island, and have by much the highest and most romantic notions of what they call their point of honour. However criminal they may be with regard to society in general; yet, with respect to one another, and to every person to whom they have once professed it, they have ever maintained the most unshaken fidelity. The magistrates have often been obliged to protect them, and pay them court, as they are known to be perfectly determined and desperate, and to extremely vindictive, that they will certainly put any person to death that has ever given them just cause of provocation. On the other hand, it never was known that any person who had put himself under their protection, and feared that he had confidence in them, had cause to repent of it, or, was injured by them in the most minute trifles; but, on the contrary, they will protect him from impositions of every kind, and be on hand to go halves with the landlord, like most other contractors and travelling savants, and will defend him with their lives, if there be occasion. Tho' of their number who have thus enlisted themselves in the service of society, are known and respected by the other banditti all over the island; and the perfons of those they accompany are ever held sacred. For these reasons, most travellers choose to hire a couple of them from town to town, and may thus travel over the whole island in safety.

The term is also applied to a sort of free-booters, who pillage in the islands of the Archipelago.

BANDOBENA, in Ancient Geography, a town of India, on this side of the Ganges, seated, according to Strabo, on the river Chospes.

BAND-DOG, in Zoology, a variety of the mastiff or Canis Molossus of Linnaeus. It is lighter, smaller, more active and vigilant than the mastiff, but not so powerful; its nose is smaller, and pooffies, in some degree, the scent of the hound; its hair is rougher, and generally of a yellowish grey, streaked with shades of a brown or black colour. It frequently feizes cattle by the flank, attacks with enraged, and its bite is keen and dangerous. It is not often to be seen at present. Bewick's Hill Quadrupeds, p. 338.

BANDOL, in Geography, a harbour of the Mediterranean, nearly well, and about five leagues from Toulon. It has a fort, and there is anchorage near the east part of a fine island, which lies on the well point of the bay that is here formed by the coast.

BANDOLEERS, from the French bandoulieres, in the Military Art. See Bandoleer.

BANDON, in Geography, the name of a fine river in the county
BAN

county of Cork, province of Munster, Ireland, which rises
in the mountains of Carbery, and after watering the large
and thriving town of Bandon-bridge, and the village of
Inihoman, falls into the harbour of Kinsale. It is navigable
for large vessels as far as Collier's quay, near Inihoman, from
which place Bandon is supplied with English coal. At
the confluence of the Bandon and Brinny rivers, a little
above Inihoman, the East India company of England formed
a settlement about the year 1612, for carrying on cotton works,
and building large ships; for which purpose they purchased
the adjoining woods and lands. They garrisoned a castle,
and built three villages; but the opposition given to this
undertaking by the natives, soon obliged them to relinquish
it. The great woods in the neighbourhood were from that
time much demolished; though the river has not yet forfeited
the charter given of it by Speucer in his Fairy
Queen:

"The pleasant Bandon, crown'd with many a wood.,"
Campbell's Political Survey of Great Britain, &c. Smith's Cork.
Beaufort's Memoir.

BANDON-BRIDGE, or, as it is more commonly called, Bandon,
a considerable market and port town of the county
of Cork, province of Munster, Ireland, situated on both
sides of the river Bandon, over which it has a bridge.
It was one of the towns which owed its origin to the laudable
exertions of Richard Boyle, the first, and frequently called
the great, earl of Cork. He built it in the year 1610, in
the midst of a waste bog and wood, which had been impassable,
and inclosed it with walls, which were of great strength for
that period. In 1613, he procured for it a charter of
incorporation, in consequence of which it sent two members
to the house of commons; and was one of the boroughs
which occasioned so violent a debate at the meeting of
Parliament in that year. It was part of the policy of lord
Cork, as appears from his letter to secretary Cook (quoted
in Smith's Cork, vol. i. p. 236.), to admit none but Protes-
tant to live in the town; which seems to have been
considered a necessary support to the infant colony.
The consequence of this was, that the inhabitants, being united
among themselves, and all trained to arms, were very powerful,
and took an active part in the civil wars which distracted
Ireland, in the middle of the seventeenth century. After
the restoration of Charles II., the exiling party was not very
strictly observed, though it had been confirmed by a by-
law of the corporation; but the adherents of James II.,
under the earl of Clancarty, having destroyed the walls in
1689, and treated the Protestant inhabitants with severity,
it was revived, and has been since, with few exceptions,
strictly attended to. The widows and advantage of this
exclusion has been often called in question, but the strongest
objection to it certainly is, that it tends to keep alive
that animosity which has been the bane of Ireland, and which
all who study the true interests of the country will endeavour
to appease. The inhabitants of Bandon have been gene-

BAN

rally industrious. For many years they carried on the manu-
ufactures of fluff, cambrics, and linens, very extensively,
but these have of late declined. Ticken of superior quality,
and coarse green linens 27 inches wide, called cotton,
made in the town and neighbourhood; the latter of which is
fent from Cork to London and Bristol. There are also some
manufactures, which employ a great number of people.
The town is chiefly the property of the duke of
Devonshire, representative of the eldest branch of the Boyle
family, and on account of the shortness of the leaves, and
the want of proper encouragement, it is in general ill built,
the houses not at all corresponding to the wealth of the in-
habits. During the late war, Bandon became a great
military station, being conveniently situated for feeding
affluence to any part of the south-western coast at which it
might be wanted, and a strong garrison is still continued
there. The population is estimated at 12,000, and it sends
a member to the imperial parliament. Its distance S.W.
from Dublin is 156 Irish miles, and S.W. from Cork 13.
N. lat. 51° 44'. W. long. about 8° 44'. Smith's Cork, &c.

BANDORA, the capital of Sallet island, and separated
from Bombay island, on the Malabar coast of India, by a
narrow channel, in N. lat. 19° 5'. E. long. 75° 30'.

BANDURA, in Moser, an inferior kind of lute, for
which the notes were written in the same kind of tablature as
for the theorbo or great lute. See LUTE.

BANDIT, in Geography, a small island in the German
ocean, near the coast of East Friesland. N. lat. 53° 36'.
E. long. 6° 33'.

BANDURI, Anselme, in Biography, an antiquary of the
eighteenth century, was a native of the republic of
Raguila, in Dalmatia, and a Benedictine monk. He studied
at Florence, and having made rapid progress in the learned
languages, he became a preceptor. Montfaucon employed
him in 1700 to examine MSS. for his projected edition of
Chrysolom's works; and for extending his acquaintance with ecclesiastical antiquities, Banduri, under the patronage of
the grand duke of Tuscany, spent some years in the abbey
of St. Germain in Paris. Here he was enabled to complete his
valuable work, intitled, "Imperial Orientale, five, Anti-
quitates Conflantinopolitane," and published at Paris, in
1711, in two volumes, folio. He also published at Paris, in
1718, fol. a collection of Roman medals, under the title of
"Numimata Imperatorum Romanorum à Trajano Decio
di Palæologos Augustis;" which was enriched and enlarged,
and reprinted in 1720, at Hamburg, in 1720, by J. A. Fabric-
ius. In 1724, Banduri was appointed librarian to the duke

BANDUSIAN FOUNTAIN, in Ancient Geography, a
famous spring of Sicily, celebrated by Horace in the thir-
teenth ode of his third book, placed by fome at his Sabine
farm; but incontrovertibly proved by the abbé Chappuy, to be
near Panazo, in the principality of St. Germain. No shady
groves now hang over its banks to shut out the burning mid-
day sun; its gild waters no longer tumble down the rocks
in beautiful cascades; but checked with dirt and loll in
bosom of the earth. This is the valley under ground to which

BANDY-LEGS, in Surgery, are the dilatation of the lower
extremities, in any direction. This disease is usually occasion-
ated by a defective osification of the Tibia or leg-bone,
which therefore is unable to sustain the weight of the body
without yielding. See Distortions, and Mollieties Offic.

BANE-BERRY, in Botany. See Acer.

BANE, in Geography, a small island of France, near the
English channel, about a league S. W. of Ushant.

BANEK, John, in Biography, a famous general of
Sweden, descended of an illustrious family, was born in 1601,
and was so much distinguished by his proficiency in literature,
that Gustavus Adolphus used to call him his learned general.
In very early youth, he attracted, by his magnanimity,
the notice of that monarch, who pronounced him formed
for great events, and placed him in the army; and he soon
signalized himself so much, that, under twenty years of age,
he was employed in many critical enterprises, which required
no less dexterity than bravery. After the death of Gustavus,
he supported, as commander in chief, the battle of the
Swedish arms, by a series of victories, which raised his mili-
tary character as high as that of any general of the age.
He sustained this reputation undiminished till his death,
at Halberstadt, on the 10th of May 1641, in the 40th year
of his age. Baner, though not inefable of the glory he
had
had acquired by his actions, usually spoke of them with great
modesty. He was accustomed to say, that he never formed an
expedition, nor hazarded an action, without the most
reasonable hopes of success. He was equally feared and
beloved by the soldiers, and always inspired them with un-
bounded confidence. At the head of his troops, he acted
solely from himself, and without dependence, and would
rather have resigned the command, than have been directed
in his military operations by the orders of the cabinet. He
had the absolute disposal of all communications, and established a
regular order of promotion; he was humane to the vanquished
enemy, cautious in not wantonly expelling his troops to
action, and he blamed those generals who in sieges sacrifice
the lives of their men to raise their own military character.
Coxe's Travels in Poland, Sc. vol. iv. p. 51.
BANFF, in Geography. See Banff.
BANGA, a town of Africa, in the country of Whidah,
on the Slave coast.
BANGALORE, a town of Hindostan, in the Myfore
country, situated in the centre of the peninsula, and having
routes passing through it in every direction. It is, in itself,
place of great political importance, being a fortress of
strength, and from situation, the bulwark of the Myfore
country, towards Arecot. It is placed, by major Rennell,
in N. lat. 13°; E. long. 77° 37' 15". This is the common
point of junction, in the centre of the peninsula, as Com-
bectore is in the south-west, and Tittlecopol in the south-
east.
BANGER, one of the principal places in the island
of Belleisle, on the coast of France; and Palais is the
other.
BANGUS, Peter, in Biography, a Swedish divine,
was born at Helingberg, in 1633, and having studied at
Upsall, travelled with a pupil through Sweden, Denmark,
and the Netherlands. On his return, he was appointed pro-
fessor of theology in the university of Abo in Finland,
and filled the chair with credit 32 years. In 1682, he was ap-
pointed bishop of Wyburn, by Charles IX. of Sweden;
and died in 1696. He took great pains to serve his country,
by establishing schools and promoting knowledge. He
wrote in Latin an ecclesiastical Swedish history; a treatise
on Sacred Chronology; a Commentary on the Hebrews,
and other works.
BANCROR, Thomas, a learned Danish divine, of the
university of Copenhagen, was born 1602. He discharged,
with great credit, the duties of the professorhips of Hebrew,
philosophy, and divinity; and was the author of several learned
works. He died in 1661. Among his writings in Latin
are various dissertations to elucidate the scriptures: "Psal-
tologica Observations," printed in Svo. at Copenhagen,
in 1640: "An Exercitation on the origin of Diversity of Lan-
guages, and on the Excellence of the Hebrew," Svo. 1643;
BANGLE EARS, in the Metre, an impression in a
horse's ears, remedied in the following manner: place his
ears in such a situation as they are wanted to stand;
bind them with two small boards, so fast as not to flir;
and then clip away the empty wrinkled skin close by the
head.
BANGO, in Geography, a long shoal on the call coast of
Africa, of variable breadth, but in some places about two
leagues. See Cape Corrientes.
BANGOR, a township of America, in Hancock
county in the dist of Maine, on the west side of Penobscot river,
25 miles from its mouth at Belfast bay; 45 N.W. by W.
from Machias; 63 N.E. from Hallowell; and 280 N.E.
from Portland.
BANGOR, a small city of Camarvashire, North Wales,
Down, in the province of Ulster, in Ireland, situated on the south side of the bay of Carrickfergus; but though permitting a grant was granted to improve its port, it has very little trade. An abbey was founded here in the sixth century, put of the ruins of which yet subsists. Near this town, Duke Schonberg landed with the English army, 13th August 1689. Diedne N. from Dublin, 90 Irish miles. N. lat. 54° 58'. W. long. 5° 33'.

BANGUE, in *Sloane's* *MSS.*, a spèce of opium, in great use throughout the East for drying clothes, and inspiring joy.

This, by the Persians, is called *hacq*; by the Arabs, *asfar*, corruptly *esfar* and *afbak*; by the Turks, *bażik*, and vulgarly *mophets*; by the European naturalists, *bhang* or *banga*. The Indians, says Acosta, eat the seeds and leaves to increase their vigour, and to excite an appetite to their food.

The nobles, and chief military officers, when they are disposed to forget their toil, and to sleep in perfect ease and security, take of the powder of the seed and leaves, as much as they think sufficient, and add to it an opium, or green hemp hazel-nut; with as much opium as they think fit, and eat them all together with sugar. If they desire to be entertained with variety of scenes, and images of things, in their sleep, they add fome of the choicest cumari, cloves, nutmegs, and mace. If they have a mind to be merry, witty, and to indulge their amours, they add ambergriefe and mulk, and make them all into an electuary with sugar. It is by many affirmed that the seed and leaves promote lust; whence says J. Boshine, it appears that this herb has no affinity with hemp, though it be very much like it; since hemp, according to Dioscorides, is of a hot and dry nature, and extinguishes amorous desires.

Rays, from whom this account is taken, says, he learned from his Hans Shawe, that it is a different plant from hemp. It grows in Hindoostan, and other parts of the East Indies, where it is principally in use. Among the Indians, the seed is prepared among other medicating and aromatic substances into an electuary, which excites pleating visions, and as some faye, emboldens them to perform the most daring and atrocious deeds. See Datura.

Banga, in reality, is a *saæcledanes* to wine, and obtains in those countries where Mahometanism is established; which prohbiting the use of that liquor absolutely, the poor wretched are forced to have recourse to *saæcledanes*, to rout their spirits. The principal are *aspam*, and this *bangue*, which, says *Sylv* (Prel. Difc. p. 124.), consists of the leaves of hemp in pills or conserve, and by the rigid Mahometans is esteemed unlawful, though not mentioned in the Koran, because it intoxicates and disturbs the understanding as wine does, and in a more extraordinary manner. It is, however, commonly used in the East, but they who abdick themselves to the use of it, are generally looked upon as debauchees. According to the account given of this substance by Alexander Manucordato, councillor and physician to the Ottoman Porte, in a letter to Wedelius, bangue is prepared of the leaves of wild hemp, dried in the shade, then ground to powder, put into a pot, in which butter has been kept; let in an oven till it begin to torrefy; then taken out, and pulverized again; and thus to be used in the quantity of as much, at a time, as will lie on the point of a knife. As to the opinion among the Europeans, that the Turks prepare themselves for battle by a dose of bangue, which routes their courage, and impels them with ardour to certain death, Dr. Manucordato affirms us, that it is a popular error. The Turks think they are then going to receive the crown of martyrdom, and would not, for any consideration, forfeit the merit of it, which they would do by eating the bangue, which is held to be unlawful by their apostle, among other things which intoxicatingly.

BANGUEY, in Geography, an island of the Indian ocean, at the northern extremity of Borneo, not far from Balabac, the most south-wetern of the Philippines. N. lat. 7° 12'. E. long. 11° 25'.

Banta or Bango Peak lies in the peninsula of Malacca. N. lat. 7° 18'. E. long. 117° 17' 30'.

BANIFS, Padro nos, a small island and sand bank, of the north-western of the islands of Malacca, in about S. lat. 5° 35', and E. long. 100° 42'.

BANIOS, Padro nos, a small island surrounded by a sand bank, east of the half island, as far as S. lat. 6° 50'. E. long. 70° 20'.

BAN, a small district of Africa, in the country of Calabar, containing nine or ten villages.

BAN, a town of Italy, in the kingdom of Naples, and province of Capua, ten miles south-thouth of Troin.

BANIAL, a city of Italy, which runs into the Lecia.

BANICA, a small island on the west coast of Sumatra, in about N. lat. 1° 46'. E. long. 96° 52'.

BANJALUKA, or BANJALUK, a considerable town of European Turkey, in Bania, the residence of a pacha, seated near the river Seina, on the frontiers of Dalmatia, 144 miles W. of Belgrade. It is supposed to contain 18,000 persons. N. lat. 44° 20'. E. long. 18° 20'.

BANIAN Days, in *Marine Language*, a cant term among sailors, to signify those days in which they have to feed meat. It seems to be derived from the practice of the people mentioned in the article Banians.

BANIAN Tree, in Botany. See Ficus.

BANIANA, in *Annius* Geography, a town of Hispania Betica, in the country of the Tarshish. Presumably.

BANIANA, a religious F-6 in the country of the Mogul who believe a *monsgikesa*, and will therefore eat no living creature, nor even kill noxious animals, but endeavour to release them, if they see them in the hands of others.

The Banians are said to be so fearful of having communication with other sects, that they break their cups, if one of a different religion have drunk out of them, or even touched them; and empty the water out of a pond where he has washed himself. It is added, that if they happen to touch one another, they must wash and purify themselves before they eat, or enter their houses. They carry hanging at their necks, a stone called *tanberan*, as big as an egg, and perforated in the middle, through which run three strings: the stone, they say, represents their great god, and upon this account, they have great respect shewn them by all the Indians.

In a more general sense, the appellation of Banians comprehends all the inhabitants of India, as contradistinct with the Mahometans: but in a more restricted and peculiar sense, it is appropriated to one of the four principal sects, into which the Indians are commonly divided; the other three being the Brahmans or prieitets, the Rajaputs or men of the sword, and the artisans and labourers. See HINDOOS.

The proper Banians are called, in the Shaster, or book of their law, by the name of *flauditri*, under which are comprehended all who live after the manner of merchants, or that deal and trade for others, as brokers; exclusive of the mechanics, or artificers, who make another craft, called *soye*. Their name in the Brahmian language, in which their law is written, signifies an innocent and harmless people; and such they really are; for they cannot bear to see a fly, worm, or any other living creature hurt; and if and they receive a bow, they take it meekly and patiently. These Banians have no peculiar sect or religion, unless it be,
be, that two of the eight general precepts given by the legislator, Bremaw to the Indian nation, are, on account of the profession of the Banians, suppos'd more immediately to relate to them, viz. those which join veracity in their words and dealings, and avoiding all practices of circumvention in buying and selling.

The Banians and the Chinese are the greatest traders in the Indies, to whom must also be added the Jews and Armenians who are greatly dispersed over those parts. But the most considerable trade is carried on by the Banians, in the whole peninsula on this side the Ganges. They are extremely skilful and cunning in commerce. Most of them follow brokerage, and most of the brokers of the English, Dutch, and French companies are of that nation. They are deemed, in general, very honest, and have almost constantly in their hands the stock and cash of those companies.

They are likewise bankers; and there are few places in the East Indies for which they cannot furnish bills of exchange. They have also a sort of standing cash or bank where persons may deposit their money, and take it out again whenever they please.

Their form of contract, in buying and selling, is remarkable; being done in the profoundest silence, only by touching each other's fingers: the buyer loosening his *pamerin* or girdle, spreads it on his knee; and both he and the seller having their hands underneath, by the intercours of the fingers, mark the price of pounds, shillings, &c. demanded, offered, and at length agreed on. When the seller takes the buyer's whole hand, it denotes a thousand, and, as many times as he squeezes it as many thousand pagods, or roupies, according to the species in question, are demanded: when he only takes the five fingers, it denotes five hundred, and when only one, one hundred; taking only half a finger, to the second joint, denotes fifty; the small end of the finger, to the first joint, stands for ten.

See CEU SWATH.

Their children are betimes accustomed to trade, and to imitate the gentleness of manners, which distinguishes this class of persons. Those of the Banians, who have slaves, treat them with great humanity. Their manner of living is very frugal, and they never depart from it, except when they sell their children; on which occasion, they spend a sum amounting to no less than 12,500L. Their women are also distinguished by their simplicity of manners. They hold the nuptial tie in great estimation; and never allow themselves the least intercourses with strangers. Their husbands will not be satisfied without this revenge; alleging against every kind of familiarity between the sexes this proverb: "if you bring butter too near the fire, you can hardly keep it from melting."

BANIAS, in Geography, a town of Syria, fifty miles S.W. of Damascus.

BANIER, ANTONY, in Biography, a French abbe, was a native of Clermont, in Auvergne, who completed his education at Paris. Having been employed in cultivated instruction, he directed his particular attention to the subject of ancient mythology, and published in two volumes, 12mo., "An Historical Explanations of the Fabules of Antiquity." This work gained him the reputation of being a writer of taste and erudition; and 1744, he was admitted into the Academy of Inscriptions and Belles Lettres. In 1751, his treaties, designed to trace the fables of the ancients to historical facts as their true origin, was much enlarged and published in the form of dialogue. The fame subje& was pursu'd by the author in several dissertations communicated to the academy of which he was a member, and published in its Memoirs. With a view to the fame subject, he presented the public with the result of his researches during the last ten years of his life, first in his "Translation of the Metamorphoses of Ovid," with historical remarks and illustrations, and the plates of Picart, published at Amsterdam, in folio, in 1732, and reprinted in 1738 at Paris, in two volumes, 4to; and afterwards in a work, intituled, "Mythology, or the Fables explained by History," printed in 4to. and also in 12mo. at Paris, in 1740, translated into English and printed at London in 1741, 4 vols. 8vo. Banier died in November 1741, aged 69 years. He published an improved edition of Marville's "Mlangez d'Histoire et de la Literature," and had a great share in the new edition of Picart's "General History of Religious Ceremaries," published in 1741.

BANIER-MASSING or BENDER MASSIN, of Mid′Anville, in Geography, a town and district on the south side of the island of Borneo: the chief product and trade of which are pepper. The factory of the Dutch lies in S lat. 5°. They have here a small fort, where a junior merchant, as resident, with about 25 or 30 soldiers, are stationed. The object of this establishment is chiefly the collection or purchase of the pepper and rough diamonds produced in the country. The resident is allowed five per cent on the pepper. The contract with the king obliges him to deliver 600,000 pounds at three fivers per pound; and this is the only article which induces the company to retain this possession; for the profits on the rough diamonds, gold, wax, canes, and fago, would not be sufficient to make good the charges. Banier-massing is of no importance to the company as a source of revenue, for they do not possess a foot of land without their fort, and are obliged to be constantly on their guard against the infectious attacks of the natives. The charges of this establishment in 1779 were about 1100L. per annum, which, together with those of conveying the pepper from Borneo to Batavia, are fiercely covered by the profits accruing from this scanty trade. The river Banjar, called Bisios by d′Anville, flows from the centre of the country almost due south, and forms the harbour of the town; and on this river is experienced a difference of twelve feet in the rise and fall of the tide. The Bisios, as they are denominated, come down this river to the port in rude boats, with gold dust, and other articles, among which are diamonds; the Moors called Banjarcens being the factors. These Bisios are tattooed blue, with a small wrapper about the loins. The chiefs extract one or two of the fore-teeth, substituting others of gold; and stringing of the teeth of tigers, which abound in the island, a real badge of knighthood or of courage, are worn round the neck.

BANII.LIA, in the Materia Medica, a name used by some for the veainilla, or vanillaes, used in making the richest chocolate.

BANISHMENT, Exile, in Law, among us, is of two kinds: the one voluntary, and upon oath; the other by compulsion, for some offence or crime.

The former, properly called abjuration, was abolished by Stat. 21. Jac. I. c. 28; and has now ceased, 2 Inf. 629: the latter is enjoined by judgment of parliament. Yet out-laying and transportation may be also considered as a species of exile.

However, no power on earth, except the authority of parliament, can send any subject of England out of the land against his will; no, not even a criminal. For exile and transportation are punishments at present unknown to the common law; and whenever the latter is now inflicted, it is either by the choice of the criminal himself to escape a capital punishment, or else by the express direction of some modern act of parliament. To this purpose Magna Charta declares (c. 29.) that no Freeman shall be banished, unless by the judgment of his peers, or by the law of the land. And by
by the **bucco corpus act** (31 Car. II. c. 2), it is enacted, that no subject of this realm, who is an inhabitant of England, Wales, or Berwick, shall be sent prisoner into Scotland, Ireland, Jersey, or Guernsey, or places beyond the seas, where they cannot have the full benefit and protection of the common law; but that all such imprisonments shall be illegal; that the person who shall dare to commit another contrary to this law, shall be disabled from bearing any office, shall incur the penalty of a præsumption, and be incapable of receiving the king's pardon; and the party suffering shall also have his private action against the person committing, and all his aids, advisers, and abettors, and shall recover treble costs besides his damages, which no jury shall assess at less than 500l. Blackett. Conn. vol. i. p. 157.

**BANISTER, John**, in **Biography**, was educated at Oxford. In 1573, having taken a bachelor's degree, he obtained a licence to practice physic. He then went to Nottingham, and professing both medicine and surgery, "was wonderfully followed (Wood says) by all forts of people, for his happy practice in those arts." Banister published several works, of which the following are the titles: "A needful, new, and necessary Treatise of Chirurgery, briefly comprehending the general and particular Curation of Ulcers, with certain Experiments of his own Invention," London, 1573, 8vo. It is dedicated to Tho. Stanhope, Esq., high sheriff of Nottinghamshire. "The History of Man, lurked from the Sap of the most approved Anatomists," nine books, fol. Lond. 1578; decorated. Douglas says, with anatomical engravings, copied from Vesalius, but miserably executed. "Compendious Chirurgery, gathered and translated, especially out of Wecker," Lond. 1585, 12mo. This is not a mere translation, the work being corrected and much improved by Banister. "Antidotiary Chirurgical," containing variety of all sorts of medicines, Lond. 1589, 8vo. In 1633, several years after his death, his chirurgical works were published together in six books, in 4to. The Antidote was dedicated to the earl of Warwick, by whom he appears to have been patronized. Wood's Athenæ Oxon. Aikin's Biog. Mem.

**Banister, Richard**, was in great credit in the end of the sixteenth and beginning of the seventeenth century, for his skill in surgery, which he practised at Stamford in Lincolnshire. His knowledge in the art he learned of his near kinsman, John Banister, by whom he had been educated. "Sitting at the feet," he says, "of a Gama- lid in that art, let his name (he adds) be as a precious ointment poured out; for he was one to whom malice itself could do no mischief, nor hatred hurt." He continued in the general practice of surgery several years. "At length," he says, "I left the greatest maps of that unceafable mystery, and confined myself to the cure of the eyes, of the hare lip, the wry neck, and to affist the hearing by an instrument." But his principal object was relieving the blind; to perfect himself in this art, he appears to have associated with Henry Blackbourne, Robert Hall of Worcester, master Velder, Surlet, and Barnabie, of Penny Stanton, Lynn, and Peterborough, all famed for their skill in teaching and performing their operations on the eyes. Following their example, he visited many of the principal cities in the kingdom, particularly London, which place he visited spring and autumn for several years. It appears to have been his custom to procure certificates of the cures he performed at each place. "I can shew," he says, "that in the year 1609, I made, with the help of God, twenty-four blind people see in the city of Norwich; and I came thither again in 1611, and all of them had their sight; for confirmation of which, I had a certificate from the mayor and alderman, with the city seal annexed." A similar certificate he obtained from Sir Wm. Cockaine, lord mayor of London in the year 1621, which appears to have been the last time of his coming hither. "But now," he says, I know it is not long to the period of my days, so I mean to rest at home the small remnant that God hath allotted to me." He promises, however, to continue to afflict those who visit him at his house. The time of his death is not known.

In 1632, he published "A Treatise of one hundred and thirteen disaffections of the eyes and eye-lids," the second time published with some profitable additions of certain principles and experiments by Richard Banister, master in chirurgery, oculist, and practitioner in physic, 12mo. The book is not paginated. The part added by Banister seems to be a small treatise at the beginning of the volume, which he calls "Banister's Breviary of the Eyes." He here complains of the number of ignorant persons, and among them many women, who interfered in the art, to the hurt of the people. This part is interlarded with poetical effusions, in which he bounces at some pretended cures performed by drinking and washing the eyes with the waters of the Malvern and other springs.

"So many folks unto the town did run
For water, that alewives were half undone.
At first, when this news went o'er the world,
I doubted was it touched my freckled
I dwelt from thence, at least some twenty miles,
Yet there my patients went o'er fields and fylies."

He had the satisfaction, however, to see them come back,
"Their bodies wearied, and their griefs made worse,
And ease'd and purged only in the parke."

The treatise which gives the general title to the volume, and of which Banister has with most people the credit of being the author, was written originally in French by Jacques Guillaume, translated into English by an anonymous writer, and dedicated to John Banister. Wood's Athenæ Oxon. Aikin's Biog. Mem.

**BANISTERIA**, in Botany, so named by Dr. Houftoum in memory of the Rev. John Banister, a curious botanist, who lost his life in the sea after a ship in Virginia. Linna. gen. n. 573. Reich. 622. Schreb. 780. Cavanilles, t. 243: 258. Gott. t. 116. Cliffs, ?anuddia biqina; manuddia Cav. Nat. Order, tribe; loll, m. Juv. Gen. Char. Col., perianth, five-pertedt (four,eldon five, Cavan.) very small, fliff underneath with tubercles, permanent; two melfiferous glands under each division of the calyx, except one; and they are therefore eight in number. Car. petals five, orbiculate, very large, spreading, crenate (limbriate C.); claws oblong, linear. Stem, filaments ten, very small, coalescing at bottom; authors simple. P. germs three, winged, coalescent; fylies three, simple; filiggae obtuse (enlarged into a leaflet, Cav.) P. capsulated three, running out into a long wing, ocellataed, marked at the sides with small appendices, not gaping. Seeds solitary, covered, toothed on the lateral edge. Jaff. The flower, especially the glands of the calyx, shew the affinity between this and melpigia. It differs however in the leafy filigmas and winged fruit. B. leona has ten, the leaf have eight glands. Cav. Eff. Char. Col., five-perted, with melliferous pores at the base on the outside. Pet. roundish with claws; filiggae leaf-shaped; seeds three, winged with membranes.

at top in a short digger point, green above, yellow beneath, nearly equal to the petioles, on which and near the leaf are two opposite glands; without stipules; flowers in opposite axillary umbels; common peduncle elongated; rays five to seven, an inch long, jointed, with two short, opposite bracts; at the base of the rays are two small suborbicular leaves; corolla sulphur-coloured. A native of Dominique, Hispaniola, &c. 12. B. purpurea. Lam. Dict. n. 2. Plum. Spec. 18. ic. 15. Mt. t. 2. A. A. 

Leaves ovate; spikes lateral; seeds erect. A stem strong and woody, dividing into many opposite and twining branches; leaves ovate, on short peduncles; there are five or six pairs of braches, near the base of the same face with those of the common acacia, but whitish on their undersides; flowers axillary, in a kind of spike; petals purplish, short; third germ often abortive, whence Plummer says that the fruit is bicapular and two winged; and Miller, that the greater number of species have only two flowers. A native of the Caribbean islands, sent to Miller from Campeachy, and cultivated by him in 1750. 3. B. laurifolia. Lomarck. Dict. n. 3. A. A. 

Leaves ovate-oblong, rigid; racemes terminal. Stem shrubby, climbing, with long, reflex, diverging, roundish, rugose branches; leaves petiolate, ovate-lanceolate, acute, entire, nerved, smooth; racemes panicled; peduncles commonly one-flowered, short, yellow; leaves at the base of the peduncles two, minute, tomentose; calyx five-veined; petals filiform; anthers elliptic; stigma three-lobed, truncate at the tip; styles filiform; fruit, small, ill-defined, one of the three capsules usually abortive; wings three or four times longer than the capsules. A native of Jamaica and Hispaniola. 4. B. longifolia. "Leaves oblong, acuminate, rigid, shining, paniculate terminal; branches spreading very much." A native of the West Indies. 5. B. bongii. "Leaves ovate-oblong, acuminate; racemes lateral; seeds spreading." This species recoeds from the genus, it has only one flower, and the capsule has four wings. It has strong woody stalk, twining about trees which grow near it, and ribs twenty feet high. A native of the East and West Indies. 6. B. dichotoma. B. convolvulis. Cavan. 

diff. 228. t. 236. Lomarck. Dict. n. 6. "Leaves ovate; branches dichotomous." Plimmer first observed it in the island of Martinico. 7. B. fulgens. "Leaves suborbate, tomentose under and on the underside; racemes branchiate; peduncles umbellate." Its slender winding stalks, up to five feet high, the twining branches in a round bunch at the extremity of the branches, of a brownish yellow colour; the seeds are smaller, and have narrow wings than in the third species. A native of Jamaica and Barbados. 8. B. brevifolia. "Leaves suborbate; branches branchiate; seeds narrower within." Very like the foregoing; but the leaves more blunt; spreading out many branches, dividing into others, and yielding tendrils which fall on neighbouring trees, and mounting to a great height; the flowers, in loose clusters at the ends of the branches, are flat of a golden colour, and fade to a yellow, succeeded by slender thin seeds. A native of Carthagena. 9. B. acuta. "Leaves pinnate; leaflets oblong, obtuse; flowers fuscous; bloom branching, prickly." Climbing spikes, dividing into many branches with long winged leaves, composed of about twenty pair of small blunt pinnae, each having a deep furrow on the under side; the flowers grow in loose spikes at the end of the branches, and are surrounded by scale leaves, as large as those of the fertile male. A native of Tolm. 10. B. coriacea. A. A. 

Plum. Mt. f. 2. t. 109. Spec. 18. "Plants branchiate; leaves ovate-acute, coriaceus; racemes axillary." A native of Jamaica and Dominique. 11. B. vitata. "Leaves ovate-oblong, quite entire, shining beneath; paniculate terminal, navelling leafy." A native of Brazil, where it was found by Commerson. 12. B. crispophylla. "Branches tufted; leaves ovate-acute, with a golden spot on the lower face, wings very long." Found by Commerson near Rio-Janeiro in Brazil. 13. B. muricata. "Leaves ovate-acute, tomentose beneath; racemes axillary; capsules muricata." A native of Peru, where it was found by Joseph de Jufilier. 14. B. leonis. "Branches tufted; leaves ovate-acuminate, coriaceous; flowers panicled." It varies with more elongated leaves. A native of America, and found by Smeththan at St. Leon, in America, whether it has been transported. 15. B. fervicaria. "Leaves ovate-acuminate, ferrugineous beneath; flowers pinnate; bracts imbricate. A native of Rio-Janeiro, near St. Sebastian, in Brazil, found there by Commerson. 16. B. emarginata. "Leaves ovate, subcoriaceous, emarginate; at the end, tomentose on the lower face, flowers racemo-corymbulose." A native of America. 17. B. purpurea. "Leaves ovate, tomentose beneath, flowers in corysts, seeds erect." A shrub, six feet high, putting out many tomentose twining branches, by which it climbs up trees. A native of Guiana, on the borders of meadows, flowering in Augwil, observed there by Aublet. 18. B. furfuracea. "Leaves ovate, acuminate, flowers in corymbs, yellow, wings gradually widening." A shrub, with a trunk five feet high, putting forth many climbing, twining branches. A native of Guiana, on trees, by the sides of meadows and fields, flowering and fruiting in Augwil, observed there by Aublet. 19. B. cordata. "Stem twining; leaves orbiculate, beneath tomentose and silky; pediuncles biglobular." A native of Jamaica, Guadaloupe, and St. Domingo. Canavilles attributes to this the same synomyns of Stome and Browne, which Linnus has given to B. fulgens. 20. B. diffusa. "Leaves coriaceous, roundish, curled, smooth, cicinate." A native of Brazil, where it was found by Dominick. 21. B. urticifolia. "Stem twining, leaves subpapillatate, fuscous, with rounded lobes, flowers in umbels." A native of Rio Janeiro, found there by Commerson. 22. B. ovata. "Stem twining, leaves ovate, acute, quite entire, flowers in umbels, involucres fuscous." A native of the island of Dominique, where it was found by Delportes and Suman. 23. B. palmata. "Stem twining, leaves palmate, tomentose beneath, pedicels biglobular." A native of St. Domingo, found there by Delportes. 24. B. angustifolia. "Stem twining, leaves fuscous, large, tomentose, pedicels biglobular." A native of St. Domingo, found there by Delportes.

The species of this genus are all inhabitants of very hot climates, chiefly of America, from Brazil to Louisiana, particularly the islands. They are shrubs, mostly with twining stems, adorning the woods with the beauty of their flowers, and the variety of their opposite leaves. Plummer discovered four sorts; and for the rest, we are obliged to Aublet, Commerson, and other modern travellers.

Propagation and Culture. These plants, being natives of hot countries, cannot be preferred in England, unless they are kept in a bank-house. They are propagated by seeds, procured from the countries where they grow, naturally gathered when fully ripe, and brought to England in land or earth. When they arrive, they should be kept in pots, and if it be autumn, or winter, the pots should be plunged into a hot bed or tanner's bark, and removed from fruit and dust, till sprouting, when they must be removed to a fresh hot-bed, which will bring up the plants; when the plants come up, let them be put into separate pots, filled with light earth, and plunged into the bank-bed, after which they must be treated like other tender plants from the same countries. Marilyn's Miller.

Banisteria. See Gouania.
BANK, in Commerce, is a denomination given to certain societies or communities, who, on the charge of the money of private persons to improve it, or keep it secure; or in a common repository, where many persons agree to keep their cash, to be always ready at their call, or direction. The word bank in this sense comes from the Italian banco, formed of the Spanish banco, a bench, whereas the ancient money-changers sat in the public markets; or, as others think, a table whereon they told their money; for the Spanish banco signifies a table, as well as a bench; as among the Greeks the word ἄνθροπος signifies a bench, as well as a table, whence the word ἄνθροπος signifies a bank. Accordingly the institution of banks commenced in Italy, where the Lombard Jews kept benches in the market-places for the exchange of money and bills. Mr. John Law, indeed, in his treatise, intituled, "Money and Trade considered," describes the invention of banks to Sweden; alleging that the bulk of their money being copper, rendered it inconvenient; and in order to remedy this, a bank was set up, where the money might be pledged, and paper credit given to the value, which passed in payment, and facilitated trade. But this opinion, says Anderson (Hist. Comm. vol. i. p. 476.), is so far from being barely probable, that it is in a manner past all doubt, that the free cities of Italy were, in very early times, the inventors of banks (banker-houses, or barker-bourhous) and bills of exchange, long before the countries on the north extremity of Europe knew any thing of commerce, which Sweden knew not a Uttil of all the rest.

It cannot be doubted but that the beginning of traffic was by exchanging one commodity for another, as men could not fuit each others occasions. But the necessities of men being so various and different, in respect to the quantity and quality of requisites, money was instituted as the most convenient medium for commerce, whereby people might procure whatsoever they found in need of, in quantities according to their exigencies.

This changed the term of bartering into that of buying and selling; yet all trading at length refuits into a general barter. For he who sells any thing to receive money for it, purchases what he requires with the same money. Money then becoming the principal engine for circulating the bulk of commerce, its application to trade is proper to be considered.

Money is used in the minister kinds of dealings, as retailing, &c. when it is commuted for all kinds of labour, and to furnish the necessary provisions for daily use. This requires its being divided into the smallest denominations of the pieces, as into shillings and pence; so that this way of dealing is not capable of being transacted by bills and figures.

Money is also employed in the more extensive and wholesale way of trade, wherein large sums are negotiated; and this occasions frequent payments from one tradesman to another. In which payments, although strictly speaking ready cash be required as often as contracts are made, yet as commerce in general consists in the mutual dealings and transactions of many traders, it may often so fall out, by means of interchangeable debts and credits, that divers traders may satisfy each others occasions, without making any payments in specie, by transferring their debts to each other.

But when such mutual conveniences do not occur, traders usually receive their money in specie, and so pay it from one to the other. Yet this way of payment is attended with many inconveniences, as trouble in counting the money, hazard in securing it from the attempts of robbers, and loss from trusting it with unfaithful servants; for the prevention of all which, cities of large commerce have very naturally instituted the use of banks.

Of the said banks some are public, consisting of a company of moneyed men, who, being duly established and incorporated by the laws of their country, agree to deposit a considerable fund or joint stock, to be employed in various ways for the use of the society: or private, being such as are set up by private persons or partnerships, who traffic in the same way upon their own single stock or credit. Of the former sort of banks, several have been established in the principal trading cities of Europe, as in Venice, Genoa, London, Edinburgh, Amsterdam, Hamburg, Paris, &c. The most ancient of these is the bank of Venice. The bank, or Banco, of Venice, commonly called banco del guini, was established in the middle of the twelfth century, or as Anderson suggests (Hist. Comm. vol. i. p. 84.), A.D. 1157, though some have dated its establishment in 1156, or former what later. It is properly a board of public credit and industry, being a general and perpetual fund for all merchants and traders, established by a solemn edict of the commonwealth, which enacts, that all payments of whole and small mercantile, and letters of exchange, shall be in banco, or bank notes; and that all debtors and creditors shall be obliged, the one to carry their money to the bank, the other to receive their payments at banco; so that payments are performed by a simple transfer from the one to the other; he who was before creditor on the bank books, becoming debtor as soon as he has resigned his right to another, who is entered down as creditor in his place; so that the parties only change names, without any effective payment being made. Indeed there are sometimes actual payments made, especially in matters of retail, and when foreigners are disposed to have ready money to carry off in specie; or when particular traders choose to have a stock by them to negotiate in bills of exchange, &c. The necessity of these effective payments has given occasion to the opening a fund of ready money; which is found so far from diminishing the stock, that this liberty of withdrawing money at pleasure rather augments it. By means of this bank, the republic, without encroaching on the freedom of commerce, or without paying any interest, is mistress of 5,000,000 ducats, to which the capital of the bank is limited, to be in readiness on any pressing occasion; the republic being security for the capital. The original fund of this bank was two millions of ducats. In one of its wars with the Turks, the state became security to pay the money lodged in it, which they had been under a necessity of using in that exigency. Its agio, in process of time, arose so high as to be 50 per cent. better than current money, although the state by several edicts endeavoured to keep it lower. Its capital was afterwards made double the original sum; and the state, in another exigency, made free with that increased capital. In after times the state endeavoured, that bank money, or the agio of the bank, should never exceed 20 per cent. advance, as it still remains to this day.

The constitution of this bank was originally founded on such just principles, that it has served as a model in the establishment of banks in other countries, and the administration of its affairs has been conducted with so much integrity, that its credit has never been shaken; and it has been of infinite benefit to the state. For adjusting and balancing all their accounts in banking, they shut their books four times in every year, for three weeks at each period. Accordingly, Venice may boast of having given the first example to Europe of an establishment altogether unknown...
Bank of England, was first established in the year 1694, partly for the convenience of commerce, and partly also for the emolument of the proprietors; and it is the greatest bank of circulation in Europe. The scheme was projected by Mr. W. Pateron, a merchant, and debated for a long while in the privy council, till at length, by an act of 5 & 6 William & Mary, cap. 20. it was enacted, that their majesties might grant a commission to take particular subscriptions for 1,200,000l. of any persons, natives or foreigners, whom their majesties were hereby empowered to incorporate with a yearly allowance of 100,000l. viz. 80,000l. or 8 per cent. for interest till redeemed, and 40,000l. to be allowed the intended bank for charges of management. The corporation was to have the name of "The governor and company of the bank of England," their saidfund to be redeemable upon a year's notice, after the 1st of August 1705, and payment of the principal, and then the corporation to cease. The company was enabled by this act to purchase lands, &c. unlimitedly, and to enjoy the other usual powers of corporations; their stock to be transferable. They were restricted from borrowing more than 1,200,000l. except on parliament funds, and from trading in any merchandise, except in bills of exchange, and in bullion, and in the sale of such goods as were the produce of lands purchased by the corporation: and all bills obligatory under the seal of the said corporation, were made affiabile by indorsement. The charter of incorporation was executed July 27, 1694; which directs, that there be a governor, deputy-governor, and twenty-four directors; and specifies the qualifications of voters and of directors, together with other regulations, which have been further amended and enlarged by subsequent statutes.

In 1697, the bank was allowed to enlarge its capital stock, by an engratment of 1,601,711 10s. Its whole capital stock, therefore, amounted at this time to 2,201,711 10s. This engratment is said to have been for the support of public credit. In 1696, tallies had been at 40, and 50, and 60 per cent. discount, and bank notes at 20 per cent. During the great recoinage of silver, which was going on at this time, the bank had thought proper to discontinue the payment of its notes, which necessarily occasioned their disferr. By this engratment act, as it was called, the capital stock of the bank was to be exempted from any tax; no act of the corporation, nor of its court of directors, nor sub-committees, should subject the particular share of any member to forfeiture; but their shares were subject to the payment of all just debts contracted by the corporation; and it was made felony to counterfeit the common seal of the bank, affixed to their sealed bills, or to alter or erase any sum in, or any indorsement on their sealed notes, signed by order of the said governor and company, or to forge or counterfeit the said bills or notes. This act was judiciously framed for the restoration of public credit; and it served to effect two points; viz. the release of the exchequer tallies and orders from the stock-jobbing harpies by engratting them into this company, and also by cancelling the bank notes, also engratted, which had been at 20 per cent. discount; because the government had been greatly deficient in their payments to the bank; and a good interest was fecured to the proprietors of the increased capital. By stat. 6 Anne c. 22. it was enacted, for securing the credit of the bank of England, that no other banking company in England shall consist of more than six persons, empowered to issue bills or notes payable on demand, or for any time less than six months, which is the only exclusive privilege belonging to the bank. In pursuance of the 7th Anne, c. 7. the bank advanced and paid into the exchequer the sum of 450,000l.; making in all the sum of 1,650,000l. which it had advanced upon its original annuity of 56,000l. interest, and 4000l. for expense of management. In pursuance of the same act, the bank cancelled exchequer bills to the amount of 1,755,027l. 17s. 10d. at 6 per cent. interest; it likewise undertook the circulation of 2,500,000l. of exchequer bills for the supply of the year; and it was at the same time allowed to take in subscriptions for doubling its capital. In 1709, therefore, the capital of the bank amounted to 4,492,243l. 17s. 10d.; and it had advanced to government the sum of 3,375,027l. 17s. 10d. By a call of 15 per cent. towards the 400,000l. advanced to government, there was paid in and made stock 656,204l. 15s. 9d.; and by another call of 10 per cent. in 1710, 501,448l. 12d. 11d. In consequence of these two calls, the bank capital amounted to 5,559,995l. 14s. 8d. In consideration of the sum of 400,000l. advanced to government without interest, the exclusive privileges of the bank were prolonged to one year's notice, after the 1st of August 1732.

The convenience which government found in issuing exchequer bills by means of the bank, produced an agreement in 1713, when the company undertook to circulate new bills for raising 1,200,000l. towards the supplies, on having an allowance of 3 per cent. per annum, payable weekly, and a further allowance of 8000l. per annum, payable quarterly. On this occasion, by 12 Anne, c. 11. the company obtained an additional term of 10 years to the period of their continuation as a corporation; so that they were not to be dissolved but upon twelve months notice after 1st of August 1724; and to enable them to fulfill their engagements, they were empowered to make a call for money upon the proprietors. In the following year, they first received the subscriptions to a loan for the public service, which had been hitherto usually taken at the exchequer; but the bank, being found more convenient for monetized persons, has usually received them ever since.

In pursuance of the stat. 3 Geo. I. c. 7. 8, 9. in 1717, the bank delivered up two millions of exchequer bills to be cancelled; and it had, therefore, at this time, advanced to government 5,375,027l. 17s. 10d. It was now agreed to reduce the interest from 6 to 5 per cent. In pursuance of the stat. 8 Geo. I. c. 21. in 1722, the bank purchased the South Sea company stock to the amount of 4,000,000l.; and in this year, in consequence of the subcriptions which it had taken in for enabling it to make this purchase, its capital stock was increased by 3,400,000l. At this time, therefore, the bank had advanced to the public 9,375,027l. 17s. 10d.; of which the sum of 1,650,000l. was entitled to 6 per cent. interest, till the 1st of August 1745; but the rest was to be reduced to 4 per cent. from and after Midsummer 1727; and the capital stock of the bank amounted only to 8,995,995l. 14s. 8d. It was upon this occasion, that the sum which the bank had advanced to the public, and for which it received interest, began first to exceed its capital stock, or the sum for which it paid a dividend to the proprietors of bank stock; or, in other words, that the bank began to have an undivided capital, and over above its divided one; and it has continued to have an undivided capital of the same kind ever since.

In 1728, the company of the bank advanced to government 1,755,000l. at 4 per cent. Interest, without any power of enlarging their capital. In the following year, they advanced the further sum of 1,250,000l. at 4 per cent. The capital due from government, after fundy redemptions, was 10,100,000l.; of which the sum of 1,000,000l. was redeemed
deemed in 1738, being part of the principal for exchequer bills cancelled in 1717.

In 1734, the company advanced a farther sum of £600,000, towards the supply for that year, without receiving any additional allowance for interest or management; but they were empowered to enlarge their capital stock to the same amount; and by the act 15 Geo. II. c. 13, establishing this contract, by which the privileges of the bank were continued till one year's notice after the 25th of August 1764, it was declared, that the acts of 7 and 12 Anne, and all other acts for determining the corporation, should be void; and that the governor and company of the bank should remain a body corporate and politic for ever, subject to such restrictions and regulations as were contained in the acts and charters then in force. The whole fund, advanced on the original fund of 100,000l. per annum, thus became 3,200,000l. and the interest upon it from 1st of August 1743, 3 per cent. per annum.

By this act, persons forging, counterfeiting, or altering any bank note, bill of exchange, dividend warrant, or any bond or obligation under that company's seal, or any indorsement upon it, or knowingly uttering the same, shall suffer death without benefit of clergy. Moreover, the company's servants breaking their trust to the company, shall suffer death as a felon without benefit of clergy. It was also enacted, that when, at a court of directors of the bank, neither the governor nor deputy governor shall attend in two hours after the time appointed for business, then any 13 or more of the directors may choose a chairman for the time, for the dispatch of business; and that such court shall be as valid as if either the governor or deputy governor had duly attended.

In consequence of the act, 19 Geo. II. c. 6, in 1746, the bank agreed to deliver up to the treasury 288,800l. in exchequer bills; in lieu of which it was to have an annuity of 4 per cent. for that sum, out of the fund for licensing spirituous liquors; and the bank was empowered to add the said 288,800l. to its capital stock, by taking in subscriptions for that purpose. Accordingly, at Michaelmas 1746, the whole debt due to the bank from the public was 11,688,800l. and its divided capital had been raised by different calls and subscriptions to 10,780,000l. The rate of these sums has continued to be the same ever since.

In 1764, the company of the bank agreed to advance 1,000,000l. towards the supplies, in exchequer bills, to be repaid in 1766; and to pay into the exchequer 110,000l. without any repayment of the principal or allowance of interest for the same; in consideration of which, the term of their charter was extended to 1st of August 1786; and the dividend on the company's stock was raised at Michaelmas from 4½ to 5 per cent. At Michaelmas 1767 it was raised to 5½ per cent.

From a very early period after the establishment of the bank, it had been the practice of the company to affix government with money in anticipation of the land and malt taxes, and by making temporary advances on exchequer bills and other securities. In the year 1781, the sums thus lent to government amounted to upwards of eight millions, in addition to the permanent debt of 11,688,800l. An agreement was now entered into for the renewal of their charter, the term of which was extended to August 1812, on the company's engaging to advance £2,000,000l. on exchequer bills, at 3 per cent. interest, to be paid off within three years out of theinking fund. In order to enable them to make this advance, a call of 8 per cent. on their capital was thought necessary, by which their former capital stock of 10,780,000l. was increased to 11,642,400l. the sum on which they now divide. The dividend was also increased one half per cent. so that it now became 6 per cent. In consequence of this agreement, the total of their advances to government on the land and malt taxes, exchequer bills, and treasury bills, was increased, on the 25th of February 1782, to 5,991,678l. The amount of the bank-notes in circulation must of course be augmented by the increase of advances to government.

In consequence of large advances to government, the great exportation of coin and bullion to Germany and Ireland, and several concurrent circumstances, which, at the commencement of the year 1791, produced an unusual demand of specie from different parts of the country on the metropolis, an order of the privy council was issued on the 26th of February, prohibiting the directors of the bank from issuing any cash in payment till the sense of parliament on the subject was obtained. This redivision was sanctioned by parliament; and a committee was appointed to examine the state of the bank, from whose report it appeared, that, on the 25th of February, after examining the outstanding claims against it with the corresponding acts, the amount of demands on the bank was 13,770,390l. and that of deficits, not including the sum of 11,688,800l. of permanent debt due by government, was 17,592,298l; so that there was a surplus of 5,826,903l.

Soon after the meeting of parliament, in November following, the committee of secrery, appointed to inquire into the expediency of continuing the redivision on the bank, reported, that the total amount of outstanding demands on the bank, on the 11th of November, was 17,578,910l. and of the funds for discharging the same, exclusively of the permanent debt, 21,148,640l. leaving a balance in favour of the bank at that time of 3,699,730l. The report stated that the advances to government had been reduced to 4,258,140l. and that the cash and bullion in the bank had increased to more than five times the value at which they floated on the 25th of February 1797, when it was about 1,272,000l.

By this statement, the solvency and solidity of the bank were satisfactorily vouched; and, indeed, its stability must be connected with that of the British government. All that it has advanced to the public must be lost before its creditors can sustain any loss. No other banking company in England can be established by act of parliament, or can consist of more than six members. It acts, not only as an ordinary bank, but as a great engine of state. It receives and pays the greater part of the annuities which are due to the creditors of the public (See National Debt, and Fund); it circulates exchequer bills; and it advances to government the annual amount of the land and malt taxes, which are frequently not paid up for some years. It likewise discounts the bills of merchants, and has, upon several different occasions, supported the credit of the principal houses, not only of England, but of Hamburgh and Holland. The business of the bank is under the direction of a governor, sub-governor, and 24 directors, who are elected annually by a general court; and it is transacted by a great number of subordinate clerks in different offices. The qualification of a director is 2000l. of a deputy-governor 3000l. and of a governor 4000l.; 500l. bank stock entitles the proprietor to vote at the general courts, provided he has been in possession of it six months.

The company may not improperly be denominated a trading company, and that which is peculiarly distinguished by the appellation of bank stock is a trading stock, the dividend of which, amounting to 11,642,400l. paid half-yearly, and now 7 per cent. accruing from the annual income of the company...
pany; and this arises from the interest received for the money advanced by the proprietors to the public, or the permanent debt of 14,886,800l. from interest on the annual temporary advances; from the profits of their dealings in bullion, and of their discounts; from the interest of stock held by the company; from the sums allowed by government for the management of the annuities paid at the offices of the bank, such as, an allowance of 450l. per million for management of the public funds, and the allowance of 8.5l. 15s. 10d. per million for receiving the contribution to loans, and from some other smaller articles.

The bank of England may be considered as the main spring of that complicated mechanism, by which the commercial payments of this country are transacted; and by which the comparatively small sum of money with which they are performed is kept in perpetual and regular circulation. The subordinate parts of this machine consist of about 70 private banking-houses in London, and about 386 banks diffused over the country. By the joint operation of these various money-dealers, almost all bank payments, founded on commercial bargains, are ultimately settled in London, with the money which issues from the bank of England. This money circulates, in ordinary times, partly of coin, and partly of bank notes. From its large capital and extensive issue of paper, that bank indirectly supplies the whole kingdom with as much gold as is required for circulation. Its notes are issued in loans, granted either for the accommodation of the public treasury, or for that of merchants by discount of their bills; and in consequence of a common agreement among the bankers, no notes of any private house are current in London. All the payments of that metropolis are in this manner effected by the paper of the bank of England; and they are chiefly transacted by the private bankers, who, according to a conjectural estimate, make daily payments to the amount of four or five millions, and have probably in their hands a very large proportion of the whole of the notes circulating in the metropolis.

The following table will exhibit, at one view, the state of the cash and bullion, the average of bank notes in circulation, and also the discounts and advances to government during the several periods which it comprehends.

In the beginning of 1798, the bank advanced to government 3,000,000 on exchequer bills, and in the progress of the year a further advance of 500,000l.; so that the total sum, advanced by the bank for the public service, and out-

In November following, a negotiation was entered into for renewing the term of the company's charter, although about 13 years of it remained. The provision was agreed to at a general court held January the 9th, 1800. The conditions were, that the bank should advance to government 5,000,000l. for the service of the year 1800, on exchequer bills, payable, without interest, out of the supplies to be granted for the year 1800, in consideration of which the term of their charter was continued till the end of twelve months notice after the 1st of August 1803.

The amount of bank notes in circulation had gradually increased since the beginning of 1797; and, during the year 1800, amounted to about 15,500,000l. The amount, on an average of a month, to 27th of January 1801, was 16,355,200l.; consisting of 13,845,500l. in notes of 5l. and upwards, and 2,519,700l. in 1l. and 2l. notes.

At a general court, held 16th of March 1801, another occasional dividend of stock was proposed. This dividend was to be made of 285,120l. of 5 per cent. annuities, at the rate of 5 per cent. for every 100l. bank capital; and the transfer was made on the 1st of May.

The commerce of London itself is immense: not only as a seat of populous and luxurious consumption but as a station of manufacturers, and an emporium of maritime trade. The number of payments occasioned by such various transactions, is further increased by the dividends which the national creditors receive on the great sum of our public debt. But in addition to all these payments, originating within the capital itself, bills are drawn upon London, and remittances are sent thither to provide for them, from all parts of the kingdom. Even foreign drafts, on account of merchants in the country, are, with scarcely any exceptions, made payable in London. And thus a great proportion of the pecuniary engagements, to which the whole commerce of the kingdom gives birth, are ultimately settled there. This transfer of the country payments to London, has, in some degree, fulfilled for a long time; the practice, once begun, was likely, from its great advantages, to be gradually extended; and, of late years, it seems to have been reduced to a regular and very commodious system. It was much facilitated by the multiplication of country banks, during that period of high prosperity and confidence which immediately preceded the late war. The formation of these throughout the whole country was actively encouraged by the private bankers of London; and, indeed, the existence of a great national bank, which, like that of England, must provide a constant reservoir of gold, naturally suggests the creation of smaller establishments. Upon the formation of such banks in the country, many traders of all descriptions, who had formerly maintained a direct correspondence with merchants in London, fell into the practice of transacting their business with the metropolis through the bank in their own neighborhood, without keeping any cash. On their account, he drew largely upon a banker in London; who agreed to execute the extensive country business he had thus acquired, at a much lower remittance, than what had formerly been paid by the several country traders to their
their separate correspondents. The rate of commissio

BAN
Should the alarm be great and of long continuance, the bank, by maintaining only a million of notes in circulation, may, by the continual return of these, be exhausted of fifty millions of guineas. Besides, a more permanent cause of a run upon the bank of England for specie is the excess of the market price of gold above its mint price. This was formerly occasioned by the debased state of gold currency; and the bank has been reduced to the necessity of coining new guineas, which were immediately melted down, that the bullion might be sold to the bank itself at the high market price. In whatever manner the high price of gold is produced, immediate demands are made upon the bank for guineas, in order to export them. Thefe it endeavours to replace, though gold cannot be purchased without a considerable loss. A molt unequal competition will thus be established between the bank, on the one hand, which buys and coins at a great loss, and the clandestine dealers, on the other hand, who melt and sell at a great profit. If the unfavourable balance of trade, which has caused this high price of bullion, were not of a temporary nature, the bank of England, by this continued accumulation of unproductive expense, might ultimately be reduced to very great distress. Besides, the excess of the market price of gold above its mint price may likewise be produced by too great a quality of paper-money. The bank, indeed, has the power of restricting the country paper, by limiting its own notes to those which are actually needed for the purposes of circulation. It has, therefore, the power in a great degree of preventing that high price of gold, and the consequent drain of its own guineas, which proceed from an excessive circulation of paper. So long, then, as the bank is liable to payments in specie, it has an evident interest to prevent its own paper, as well as that of the whole country, from being so excessive, as to occasion a rise in the price of commodities. To limit the total amount of paper issued, and to retort, whenever the temptation of borrowing is strong, to some effectual principle of restriction; never to diminish greatly the sum in circulation, but to let it vibrate only within certain limits; to afford a slow and cautious extension of it, as the general trade of the country is enlarged; and to permit a temporary increase during an extraordinary period of difficulty or alarm:—this, according to Mr. Thornton (ubi infra), is the true policy of an institution placed in the circumstances of the bank of England.

If the bank of England, says an anonymous writer (Edinb. Rev. N. 1. p. 196.), must now be considered as a national establishment, not merely influencing, by the superior magnitude of its capital, the state of commercial circulation, but guiding its movements according to views of public policy, an important revolution has taken place since the first erection of that corporation as a banking establishment. That power of refining the medium of exchange, with the opportunities it implies of varying its quantity and value, which, while precious coin was in use, was exercised under the immediate prerogative of the crown, is now virtually invested in the governor and directors of the bank of England. In the official character of that board, some of the functions of sovereignty are united to those of a trader; and the opportunities of banking profits are blended with a trust and charge of the public interest. It will be pleasing if these shall prove more happily compatible, than they have been found in other institutions. The organization of this establishment, possessed of such means to control the operations of commerce, as well as to facilitate the advance of financial supplies, may, into our political constitution already so complicated, introduce a new principle of action, the effect of which cannot be clearly determined. Perhaps an unbounded field will be opened for the exten-
sixth of the whole. If we consider the quick circulation which paper admits of, and the increase which an accelerated rate of circulation gives to the effective powers of currency, this addition of almost one-sixth must be regarded as an immense augmentation of the mass of efficient currency. While the issue of bank of England notes was moderate and restrained, the market price of bullion, particularly of silver bullion, which is a more certain standard of gold, because it is a more regular article of commerce, continued very nearly the same as its established price in our mint. In the summer of 1799, however, about the same time with the great increase of bank paper, a rapid and extraordinary advance took place in the market price of bullion. That of silver rose at once to 6s. 8d. almost 10 per cent. above the mint price. It continued to rise along with the progressive increase of notes; and in 1801, when they exceeded fifteen millions, it was as high as 6s. more than 16 per cent. and even as 6s. 1d. more than 17 per cent. above the mint price. Thus also, while the issue of the bank of England notes was moderate and restrained, the rate of exchange at Hamburg continued in favour of this country, being from three to five per cent. above par. But in the summer of 1799, about the same time with the great increase of bank paper, a very rapid fall took place. It fell at once to 32 above eight per cent. below par; and continued to fall almost regularly, though not quite so regularly as the price of bullion rose, along with the progressive increase of notes. At the commencement of 1801, when they exceeded fifteen millions, the exchange with Hamburg was as low as 29l. 10s. almost 15 per cent. below par. Lord King has subjoined a list of tables, which exhibit the remarkable correspondence between the variations in the quantity of bank notes, and the variations in the price of bullion and rate of exchange. His lordship has also shewn, that the paper currency of the bank of Ireland has been augmented from £21,017l. 17s. 11d. in 1797, to £2,653,864l. 13s.; and that its notes at present in circulation exceed more than four times the amount of what were in circulation when the act of restriction was passed. During the same period, the price of silver in Dublin has experienced a great advance, having varied from 6s. 6d. to 7s. 6d. Irish currency; an increase, which, eliminating the mint price at 5s. 7d. is from 14 to 20 per cent. The rate of exchange between Dublin and London has been also remarkably affected; the difference having progressively increased from 83, the ordinary difference, to 10, 12, 14, and even 16. This proof of the depreciation of bank of Ireland notes has not been confined to the course of exchange with London, but is felt in the transactions of Dublin with many of the provincial towns, where those notes have not acquired a general circulation; the currency still confining either of specie, or of country notes. In consequence of this, and of the depreciated condition of the Dublin currency, there is an actual difference of exchange between Dublin and those towns. This is the case, for instance, in Belfast; when a payment is there made in bank of Ireland notes, an additional sum is paid proportional to the discount. Hereby Lord King infers, that the measure of 1797 has actually had a pernicious influence upon the system of circulation; and in long terms deprecates its continuance. Mr. Thorton states the following fact, that the enumeration of country-banks taken in 1805, differed from that taken in 1797, by the excess of 336 above 355.

It is not, says Dr. Smith (ubi infra), by augmenting the capital of the country, but by rendering a greater part of that capital active and productive than would otherwise be so, that the most judicious operations of banking can increase the industry of the country. That part of his capital which a dealer is obliged to keep by him unemployed, and in ready money for answering occasional demands, is so much dead stock, which, so long as it remains in this situation, produces nothing either to him or to his country. The judicious operations of banking enable him to convert this dead stock into active and productive stock; into materials to work upon, into tools to work with, and into provisions and subsistence to work for; into stock which produces something both to himself and to his country. The gold and silver money which circulates in any country, and by means of which the produce of its land and labour is annually circulated and distributed to the proper consumers, is, in the same manner, as the ready money of the dealer, dead stock. It is a very valuable part of the capital of the country, which produces nothing to the country. The judicious operations of banking, by substituting paper in the room of a great part of this gold and silver, enable the country to convert a great part of this dead stock into active and productive stock; into stock which produces something to the country. The gold and silver money which circulates in any country may very properly be compared to a highway, which while it circulates and carries to market all the goods and corn of the country, produces itself not a single pile of either. The judicious operations of banking, by providing, if I may be allowed to violent a metaphor, a road waggon-way through the air, enable the country to convert, as it were, a great part of its highways into good pastures and corn fields, and thereby to increase very considerably the annual produce of its land and labour. The commerce and industry of the country, however, it must be acknowledged, though they may be somewhat augmented, cannot be altogether to secure, when they are thus, as it were, suspended upon the Dardanian wings of paper money, as when they travel about upon the solid ground of gold and silver. Over and above the accidents to which they are exposed from the unskilfulness of the conductors of this paper money, they are liable to several others, from which no prudence or skill of those conductors can guard them. Mr. Hume (Effays, vol. ii. Eff. iii. p. 301.) expresses his doubt concerning the benefit of banks and paper credit. That provisions and labour, he says, should become dear by the incease of trade and money is, in many respects, an inconvenience, but an inconvenience that is unavoidable, and the effect of that public wealth and prosperity which are the end of all our wishes. It is compensated by the advantages, which we derive from the possession of these precious metals, and the weight which they give the nation in all foreign wars and negotiations. But there appears no reason, as he conceives, for increasing that inconvenience by a counterfeit money, which foreigners will not accept of in any payment, and which any great disorder in the state will reduce to nothing. (See Paper-Money.) Inquiry into the nature and effects of the Paper Credit of Great Britain, by Henry Thornton, Esq. M.P. London, 1802. Smith's Nature and Causes of the Wealth of Nations, vol. i. p. 479–484.

In Scotland, there are two public banks erected at Edinburgh; of which the one, called "The Bank of Scotland," was chartered by act of parliament in 1695; the other, called "The Royal Bank," by royal charter in 1727. New banking companies have been also erected within the last thirty and forty years in almost every considerable town, and even in some country villages. The banknotes of the country, says Dr. Smith (vol. i. p. 442.), is almost entirely carried on by means of the paper of these different banking companies, with which purchases and payments of all kinds are commonly made. Silver very seldom appears except in the change.
change of a twenty shilling bank note, and gold seldom.

But though the conduct of all these different companies has not been unexceptionable, and has accordingly required an act of parliament to regulate it; the country, notwithstanding, has derived great benefit from their trade. It has been affected, says this writer, that the trade of the city of Glasgow doubled in about fifteen years after the first erection of the banks there; and that the trade of Scotland has more than quadrupled since the first erection of the two public banks at Edinburgh. Whether this statement be strictly just or not, it is certain, that the trade and industry of Scotland have increased very considerably during this period, and it must be allowed, as a unquestionable fact, that the banks have greatly contributed to this increase. The whole value of the gold and silver, which circulated in Scotland before the union, cannot be estimated at less than a million sterling. In the present times, says Dr. Smith, the whole circulation of Scotland cannot be estimated at less than two millions, of which that part which consists in gold and silver, most probably, does not amount to half a million. But though the circulating gold and silver of Scotland have suffered a great diminution during this period, its real riches and prosperity do not appear to have suffered any. In agriculture, manufactures, and trade, on the contrary, the annual produce of its land and labour has evidently been augmented. It is chiefly by discounting bills of exchange, that is, by advancing money upon them before they are due, that the greater number of banks and bankers infuse their promissory notes; deducting always, upon the sum they advance, the legal interest till the bill shall become due. The payment of the bill when it becomes due, replaces to the bank the value of what had been advanced, together with a clear profit of the interest. The banker, who advances to the merchant whose bill he discounts, not gold and silver, but his own promissory notes, has the advantage of being able to discount to a greater amount by the whole value of his promissory notes, which he finds by experience are commonly in circulation. He is thereby enabled to make his clear gain of interest into a much larger sum. The commerce of Scotland was much less considerable than it is now, when the two first banking companies were established, and those companies would have had but little trade, if their business had been restricted to the discounting of bills of exchange. They invented, therefore, another method of infusing their promissory notes; by granting, what they called "cash accounts," that is, by giving credit to the extent of a certain sum (e.g. 2 or 3000 pounds), to any individual who could procure two persons of undisputed credit and good landed estate to become security for him, that whatever money should be advanced to him within the sum for which the credit had been given, should be repaid upon demand, together with the legal interest. Credits of a similar kind are commonly granted by banks and bankers, in all different parts of the world. But the cases upon which the Scotch banking companies accept of repayment are, says Dr. Smith, peculiar to them, and have, perhaps, been the principal cause, both of the great trade of their companies, and of the benefits which the country has received from it. Whoever has a credit of this kind with one of these companies, and borrows e.g. a thousand pounds upon it, may repay this sum by piece-meal. by 20l. and 30l. at a time; the company discounting a proportionable part of the interest of the great sum from the day on which each of those small sums is paid in, till the whole be in this manner repaid. All merchants, therefore, and almost all men of business, find it convenient to keep such cash accounts with them, and are thereby interjected to promote the trade of those companies, by readily receiving their notes in all payments, and by encouraging all those with whom they have any influence to do the same. The banks, when their customers apply to them for money, generally advance it to them in their own promissory notes. Thus, the merchants pay away to the manufacturers for goods, the manufacturers to the farmers for materials and provisions, the farmers to their landlords for rent, the landlords repay them to the merchants for the conveniences and luxuries with which they supply them, and the merchants again return them to the banks in order to balance their cash accounts, or to replace what they may have borrowed of them; and thus almost the whole money business of the country is transacted by means of them. Hence the great trade of these companies.

By means of these cash accounts, every merchant can, without imprudence, carry on a greater trade than he otherwise could do. If there are two merchants, one in London, and the other in Edinburgh, who employ equal fleets in the same branch of trade, the Edinburgh merchant can, without imprudence, carry on a greater trade, and give employment to a greater number of people, than the London merchant. The London merchant is kept always, by him a considerable sum of money, either in his own coffers, or those of his banker, who gives him no interest for it, in order to answer the demands continually coming upon him for payment of the goods which he purchases upon credit. Let the ordinary amount of this sum be supposed 500l. The value of the goods in his warehouse must always be left by 500l. than it would have been, had he not been obliged to keep such a sum unemployed. Let us suppose that he generally disposes of his whole flock upon hand, or of goods to the value of his whole flock upon hand, once in the year. By being obliged to keep so great a sum unemployed, he must sell in a year 500l. worth less goods than he might otherwise have done. His annual profits must be left by all that he could have made by the sale of 500l. worth more goods; and the number of people employed in preparing his goods for market, must be left by all those that 500l. more flock could have employed. The merchant in Edinburgh, on the other hand, keeps no money unemployed for answering such occasional demands. When they actually come upon him, he satisfies them from his cash account with the bank, and gradually replaces the sum borrowed with the money or paper which comes in, from the occasional sales of his goods. With the same flock, therefore, he can without imprudence, have at all times in his warehouse a larger quantity of goods than the London merchant; and can thereby both make a greater profit himself, and give constant employment to a greater number of industrious people who prepare these goods for the market. Hence the great benefit which the country has derived from this trade.

The late multiplication of banking companies in both parts of the united kingdom, an event by which many people have been much alarmed, instead of diminishing, increases the security of the public. It obliges all of them to be more circumspect in their conduct, and, by not extending their currency beyond its due proportion to their cash, to guard themselves against those malicious runs, which the rivalry of so many competitors is always ready to bring upon them. It refines the circulation of each particular company within a narrower circle, and reduces their circulating notes to a smaller number. By dividing the whole circulation into a greater number of parts, the failure of any company, an accident which, in the course of things, must sometimes happen, becomes of less consequence to the public. This free competition too, oblige all bankers to be more
more liberal in their dealings with their customers, left their rivals should carry them away. In general, if any branch of trade, or any division of labour, be advantageous to the public, the freer and more general the competition, it will always be the more so. Smith’s Wealth of Nations, vol. i. p. 446, &c. p. 498, &c.

**Banks of Deposit** are such as are instituted wholly for the benefit of the public. Of these Dr. Smith has given the following account: “The currency of a great state, such as France or England, generally consists almost entirely of its own coin. Should this currency, therefore, be at any time worn, clipped, or otherwise degraded below its standard value, the state by a reformation of its coin can effectually re-establish its currency. But the currency of a small state, such as Genoa or Hamburg, can seldom consist altogether in its own coin, but must be made up, in a great measure, of the coins of all the neighbouring states with which its inhabitants have a continual intercourse. Such a state, therefore, by reforming its coin, will not always be able to reform its currency. If foreign bills of exchange are paid in this currency, the uncertain value of any sum, of that which is in its own nature so uncertain, must render the exchange always very much against such a state; its currency being, in all foreign states, necessarily valued even below what it is worth.

In order to remedy the inconvenience to which this disadvantageous exchange must have subjected their merchants, such small states, when they began to attend to the interest of trade, have frequently enacted, that foreign bills of exchange of a certain value should be paid, not in common currency, but by an order upon, or by a transfer in the books of a certain bank, established upon the credit, and under the protection of the state; this bank being always obliged to pay, in good and true money, exactly according to the standard of the state. The bank of Venice established in 1157; that of Genoa in 1345; that of Amsterdam in 1609, that of Hamburg in 1619, and the bank of Nuremberg, seem to have been all originally established with this view, though some of them may have afterwards been made subservient to other purports. The money of such banks, being better than the common currency of the country, necessarily bore an agio, which was greater or smaller, according as the currency was supposed to be more or less degraded below the standard of the state. The agio of the bank of Hamburg, for example, which is paid to be commonly about fourteen per cent. is the supposed difference between the good standard money of the state, and the clip, worn, and diminished currency, poured into it from all the neighbouring states.

Before 1609, the great quantity of clip and worn foreign coin which the extensive trade of Amsterdam brought from all parts of Europe, reduced the value of its currency about nine per cent. below that of good money fresh from the mint. Such money no sooner appeared than it was melted down or carried away, as it always is in such circumstances. The merchants, with plenty of currency, could not always find a sufficient quantity of good money to pay their bills of exchange; and the value of those bills, in spite of several regulations which were made to prevent it, became in a great measure uncertain.

In order to remedy these inconveniences, a bank was established in 1609, under the guarantee of the city. This bank received both foreign coin, and the light and worn coin of the country at its real intrinsic value in the good standard money of the country, deducting only so much as was necessary for defraying the expense of coining, and the other necessary expense of management. For the value which remained after this small deduction was made, it gave a credit in its books. This credit was called bank money, which, as it represented money exactly according to the standard of the mint, was always of the same real value, and intrinsically worth more than current money. It was at the same time enacted, that all bills drawn upon or negotiated at Amsterdam, of the value of six hundred guilders and upwards, should be paid in bank money, which at once took away all uncertainty in the value of those bills. Every merchant, in consequence of this regulation, was obliged to keep an account with the bank in order to pay his large bills of exchange, which necessarily occasioned a certain demand for bank money.

Bank money, over and above both its intrinsic superiority to currency, and the additional value which this demand necessarily gives it, has likewise some other advantages. It is secure from fire, robbery, and other accidents; the city of Amsterdam is bound for it; it can be paid away by a simple transfer, without the trouble of counting, or the risk of transporting it from one place to another. In consequence of these different advantages, it seems from the beginning to have borne an agio, and it is generally believed, that all the money originally deposited in the bank was allowed to remain there, nobody caring to demand payment of a debt which he could fall for a premium in the market. By demanding payment of the bank, the owner of a bank credit would lose this premium. As a shilling fresh from the mint, will buy no more goods in the market than one of our common worn shillings, so the good and true money which might be brought from the coffers of the bank into those of a private person, being mixed and confounded with the common currency of the country, would be of no more value than that currency, from which it could no longer be readily distinguished. While it remained in the coffers of the bank, its superiority was known and ascertained. When it had come into those of a private person, its superiority could not well be ascertained without more trouble than perhaps the difference was worth. By being brought from the coffers of the bank, besides, it lost all the other advantages of bank money; its security, its easy and safe transferability, its use in paying foreign bills of exchange. Over and above all this, it could not be brought from those coffers, as will appear by and by, without previously paying for the keeping.

Those deposits of coin, or those deposits which the bank was bound to restore in coin, constituted the original capital of the bank, or the whole value of what was represented by what is called bank money. At present, they are supposed to constitute but a very small part of it. In order to facilitate the trade in bullion, the bank has been for these many years in the practice of giving credit in its books upon deposits of gold and silver bullion. This credit is generally about five per cent. below the mint price of fresh bullion. The bank grants at the same time what is called a receipt or receipt, entitling the person who makes the deposit, or the bearer, to take out the bullion again at any time within six months, upon transferring to the bank a quantity of bullion money equal to that for which credit had been given in its books when the deposit was made, and upon paying one-fourth per cent. for the keeping, if the deposit was in silver; and one-half per cent. if it was in gold; but at the same time declaring, that in default of such payment, and upon the expiration of this term, the deposit should belong to the bank at the price at which it had been received, or for which credit had been given in the transfer books.

What is thus paid for the keeping of the deposit may be considered as a sort of warehouse rent; and why this ware-
Bank.

Bullion rent should be so much dearer for gold than for silver, several different reasons have been assigned. The fineness of gold, it has been said, is more difficult to be ascertained than that of silver. Frauds are more easily practiced, and occasion a greater loss in the most precious metal. Silver, besides, being the standard metal, the state, it has been said, wishes to encourage more the making of deposits of silver than those of gold.

Deposits of bullion are most commonly made when the price is somewhat lower than ordinary; and they are taken out again when it happens to rise. In Holland, the market price of bullion is generally above the mint price, for the same reason that it was so in England before the last reformation of the coin. The difference is said to be commonly from about six to sixteen shillings up to the mark, or eight ounces of silver of eleven parts fine, and one part alloy. The bank price, or the credit which the bank gives for the deposits of such silver (when made in foreign coins of which the fineness is well known and ascertained, such as Mexico dollars), is twenty-two guilders the mark; the mint-price is about twenty-three guilders, and the market price from twenty-three guilders fixed, to twenty-three guilders sixteen shillings, or from two to three per cent. above the mint price. The proportions between the bank price, the mint price, and the market price, of gold bullion, are nearly the same. A person can generally sell his receipt for the difference between the mint price of bullion and the market price. A receipt for bullion is almost always worth something, and it very seldom happens, therefore, that any body suffers his receipt to expire, or allows his bullion to fall to the bank at the price at which it had been received either by not taking it out before the end of the six months or by neglecting to pay the one-fourth or one-half per cent. in order to obtain a new receipt for another six months. This, however, though it happens seldom, is said to happen sometimes, and more frequently with regard to silver, on account of the higher warehouse rent which is paid for keeping of the more precious metal.

The person who by making a deposit of bullion obtains both a bank credit and a receipt, pays his bills of exchange as they become due with his bank credit; and either sells or keeps his receipt according as he judges that the price of bullion is likely to rise or to fall. The receipt and the bank credit seldom keep long together, and there is no occasion that they should. The person who has a receipt, and who wants to take out bullion, finds always plenty of bank credits, or bank money to buy at the ordinary price; and the person who has bank money, and wants to take out bullion, finds receipts always in equal abundance.

The owners of bank credits, and the holders of receipts, constitute two different sorts of creditors against the bank. The holder of a receipt cannot draw out the bullion for which it is granted, without re-affixing to the bank a sum of bank money equal to the price at which the bullion had been received. If he has no bank money of his own, he must purchase it of those who have it. The owner of bank money cannot draw out bullion without producing to the bank receipts for the quantity which he wants. If he has none of his own, he must buy them of those who have them. The holder of a receipt, when he purchases bank money, purchases the power of taking out a quantity of bullion, of which the mint price is five per cent. above the bank price. The agio of five per cent., therefore, which he commonly pays for it, is paid not for an imaginary, but for a real value. The owner of bank money, when he purchases a receipt, purchases the power of taking out a quantity of bullion of which the market price is commonly from two to three per cent. above the mint price. The price of the receipt, and the price of the bank money, compound or make up between them the full value or price of the bullion.

Upon deposits of the coin current in the country, the bank grants receipts likewise as well as bank credits; but those receipts are frequently of no value, and will bring no price in the market. Upon ducatons, for example, which in the currency pays for three guilders three shillings each, the bank gives a credit of three guilders only, or five per cent. below their current value. It grants a receipt likewise to the bearer to take out the number of ducatons deposited at any time within six months, upon paying one-fourth per cent. for the keeping. This receipt will frequently bring no price in the market. Three guilders bank money generally fell in the market for three guilders three shillings, the full value of the ducatons, if they were taken out of the bank, and before they could be taken out, one-fourth per cent. must be paid for the keeping, which would be mere loss to the holder of the receipt. If the agio of the bank, however, should at any time fall to three per cent. such receipts might bring some price in the market, and might fall for one and three-fourths per cent. But the agio of the bank being now generally about five per cent. such receipts are frequently allowed to expire, or, as they express it, to fall to the bank. The receipts which are given for deposits of gold ducatons fall to it yet more frequently, because a higher warehouse rent, or one half per cent., must be paid for the keeping of them before they can be taken out again. The five per cent. which the bank gains, when deposits either of coin or bullion are allowed to fall to it, may be considered as the warehouse rent for the perpetual keeping of such deposits.

The sum of bank money for which the receipts are expired must be very considerable. It must comprehend the whole original capital of the bank, which, it is generally supposed, has been allowed to remain there from the time it was first deposited, nobody caring either to renew his receipt or to take out his deposit, as for the reasons already assigned, neither the one nor the other could be done without loss. But whatever may be the amount of this sum, the proportion which it bears to the whole mass of bank money is supposed to be very small. The bank of Amsterdam has for these many years past been the great warehouse of Europe for bullion, for which the receipts are very seldom allowed to expire, or, as they express it, to fall to the bank. The far greater part of the bank money, or of the credits upon the books of the bank, is supposed to have been created, for these many years past, by such deposits which the dealers in bullion are continually both making and withdrawing.

No demand can be made upon the bank but by means of a receipt or receipt. The smaller sums of bank money, for which the receipts are expired, is mixed and confounded with the much greater sums for which they are still in force; so that, though there may be a considerable sum of bank money, for which there are no receipts, there is no specific sum or portion of it which may not at any time be demanded by one. The bank cannot be debtor to two persons for the same thing; and the owner of bank money who has no receipt, cannot demand payment of the bank till he buys one. In ordinary and quiet times, he can find no difficulty in getting one to buy at the market price, which generally corresponds with the price at which he can sell the coin or bullion it entitles him to take out of the bank.

It might be otherwise during a public calamity; an invasion
The owners of bank money being then all eager to draw it out of the bank, in order to have it in their own keeping, the demand for receipts might raise their price to an exorbitant height. The holders of them might form extravagant expectations, and instead of two or three per cent. demand half the bank money for which credit had been given upon the deposits that the receipts had been respectively granted for. The enemy, informed of the constitution of the bank, might even buy them up, in order to prevent the carrying away of the treasure. In such emergencies, the bank, it is supposed, would break through its ordinary rule of making payment only to the holders of receipts. The holders of receipts, who had no bank money, might have received within two or three per cent. of the value of the deposit for which their respective receipts had been granted. The bank, therefore, it is said, would in this case make no scruple of paying, either with money or bullion, the full value of what the owners of bank money, who could not get no receipts, were credited for in its books; paying at the same time two or three per cent. to such holders of receipts as had no bank money, that being the whole value which in this state of things could justly be supposed due to them.

Even in ordinary and quiet times it is the interest of the holders of receipts to depress the agio, in order either to buy bank money (and consequently the bullion, which their receipts would then enable them to take out of the bank) for much cheaper, or to sell their receipts to those who have bank money, and who want to take out bullion, for so much dearer; the price of a receipt being generally equal to the difference between the market price of bank money and that of the coin or bullion for which the receipt had been granted. It is the interest of the owners of bank money, on the contrary, to raise the agio, in order either to sell their bank money for much dearer, or to buy a receipt for much cheaper. To prevent the flock jobbing tricks which these opposite interests might sometimes occasion, the bank has of late years come to the resolution to sell at all times bank money for currency, at five per cent. agio, and to buy it again at four per cent. agio. In consequence of this resolution, the agio can never either rise above five, or fall below four per cent. and the proportion between the market price of bank and that of current money, is kept at all times very near to the proportion between their intrinsic values. Before this resolution was taken, the market price of bank money used sometimes to rise so high as nine or nine and a half per cent. agio, and sometimes to fall so low as par, according as opposite interests happened to influence the market.

The bank of Amsterdam professes to lend out no part of what is deposited with it, but, for every guilder for which it gives credit in its books, to keep in its repositories the value of a guilder either in money or bullion. That it keeps in its repositories all the money or bullion for which there are receipts in force, for which it is at all times liable to be called upon, and which, in reality, is continually going from it and returning to it again, cannot well be doubted. But whether it does so likewise with regard to that part of its capital, for which the receipts are long ago expired, for which in ordinary and quiet times it cannot be called upon, and which in reality is very likely to remain with it for ever, or as long as the states of the United Provinces shall, may perhaps appear more uncertain. At Amsterdam, however, no point of faith is better established than that for every guilder, circulated as bank money, there is a correpndent guilder in gold or silver to be found in the treasure of the bank. The city is guaranteed that it should be so. The bank is under the direction of four reigning burgomasters, who are changed every year. Each new set of burgomasters visits the treasure, compares it with the books, receives it upon oath, and delivers it over with the same solemnity to the set which succeeds; and in that sober and religious country, oaths are not yet disregarded. A rotation of this kind seems alone a sufficient security against any practices which cannot be allowed. Amidst all the revolutions which faction has ever occasioned in the government of Amsterdam, the prevailing party has at no time accused their predecessors of infidelity in the administration of the bank. No accusation could have affected more deeply the reputation and fortune of the disgraced party, and if such an accusation could have been supported, we may be assured, that it would have been brought. In 1672, when the French king was at Utrecht, the bank of Amsterdam paid so readily as left no doubt of the fidelity with which it had observed its engagements. Some of the pieces which were then brought from its repositories appeared to have been foreshed with the fire which happened in the town-house soon after the bank was established. Those pieces, therefore, must have lain there from that time.

What may be the amount of the treasure in the bank, is a question which has long employed the speculations of the curious. Nothing but conjecture can be offered concerning it. It is generally reckoned that there are about two thousand people who keep accounts with the bank, and allowing them to have, one with another, the value of fifteen hundred pounds sterling lying upon their respective accounts (a very large allowance), the whole quantity of bank money, and consequently of treasure in the bank, will amount, to about three millions Sterling, or at eleven guilders the pound sterling, thirty-three millions of guilders; a great sum, and sufficient to carry on a very extensive circulation, but vastly below the extravagant ideas which some people have formed of this treasure.

The city of Amsterdam derives a considerable revenue from the bank. Besides what may be called the warehouse rent above mentioned, each person, upon first opening an account with the bank, pays a fee of ten guilders; and for every new account, three guilders are charged; for every transfer two guilders; and if the transfer is for less than three hundred guilders, fix guilders, in order to discourage the multiplication of small transactions. The person who neglects to balance his account twice in the year, forfeits twenty-five guilders. The person who orders a transfer for more than is due upon his account, is obliged to pay three per cent. for the sum overdrawn, and his order is set aside into the bank. The bank is supposed too to make a considerable profit by the sale of the foreign coin or bullion which sometimes falls to it by the expiring of receipts, and which is always kept until it can be sold with advantage. It makes a profit likewise by selling bank money at five per cent. agio, and buying it in at four. These different emoluments amount to a good deal more than what is necessary for paying the salaries of officers, and defraying the expense of management. What is paid for the keeping of bullion upon receipts, is alone supposed to amount to a net annual revenue of between one hundred and fifty thousand and two hundred thousand guilders. Public utility, however, and not revenue, was the original object of this institution. Its object was to relieve the merchants from the inconvenience of a disadvantageous exchange. The revenue which has arisen from it was unforeseen, and may be considered as accidental. Smith's Wealth of Nations, vol. ii. p. 219.
Bank of France was first projected by Mr. Law, a native of Scotland, with a view of paying off the public debts of France, by drawing its creators into the newly projected Mississippi and India companies, and erected in the year 1716. It was taken into the king’s hands in 1718, and denominated the royal bank; and by its union with both the companies above-mentioned, formed a bubble, which occasioned great confusion and diffidence in the year 1736.

Bank, Million, derived its name from king William’s million lottery in the year 1695; the proprietors agreeing in partnership to purchase tickets in this lottery. They afterwards purchased many revisions of the 14 per cent. annuities, and admitted many proprietors of annuities to purchase their joint stock, which amounted to 500,000. They were a partnership by deed enrolled in chancery, in the year 1731. They divided 5 per cent. till Lady-day 1728, when they reduced their annual dividend to 4 per cent. and it was again raised to 5 per cent. which it continued until its dissolution.

Bank of London, Copenhagen, has a capital stock, consisting of 300,000 rix-dollars, each being of the value of about 45. 6d. Sterling. Its notes are received in payment of the royal revenues. It lends money on pledges, not exceeding 100 rix-dollars, at an interest of 4 per cent. In 1762, his Danish majesty directed the bank for current bank-notes, to exchange their 100 rix-dollar notes, for notes of 50, 10, or 1 rix-dollar; and not to pay any one person above one crown in specie.

Bank of Rotterdam was erected in 1675. It pays bills of exchange in large money, and only 10 per cent. in guilders.

Bank of Affiguration, a new bank established in Russia during the hostilities against the Turks. When copper-money could not be coined with sufficient expedition to answer the necessities of the state, bank notes to the value of 50, 75, and 100 rubles, in copper, were issued. These notes are changed at the bank in Petersburg and Moscow. The former is a brick building, containing several vaulted rooms, each capable of holding 400,000 of copper coin in bags, piled one above another. Since the year 1784, the old bank notes were called in, and a new issue made to the acknowledged amount of 100,000,000 rubles, in notes of 5, 10, 15, 25, and 100 rubles. On the first appearance of this paper, it was received, particularly in the remote parts of the empire, not without difficulty, and the discount against it was commonly about 3½, and in some places even 6 per cent. The obvious advantages, however, over copper money, soon recommended it to general use, and it was found to be beneficial to commerce, that in 1779 the discount in favour of silver specie was only 1½ per cent. and it bore a premium of 1½ per cent. over copper money. But so large a quantity was circulated, and the loans to government so lowered the credit of the state, that in 1790 the discount against the paper currency was near 20 per cent.

The Loan Bank is an institution established at Peterburgh for the benefit of the nobility and corporations. With this view Catherine II., in 1786, made a deposit of 22 millions of rubles for the nobility, 11 millions for the corporate towns, and 3 millions for the province of Taurida, to be lent out for the improvement of rural economy, of social industry, and the benefit of civilization in general. This bank lends only on real estates. As the value of a landed estate in Russia is estimated according to the number of boors upon it, the bank takes the boors at 40 rubles per head; so that the proprietor of an estate, requiring the loan of 1000 rubles, must give 25 boors as his pledge. The loan is made for 20 years; the mortgagor annually paying 5 per cent. interest, and 3 per cent. on the capital, so that after 20 years he has paid back the whole of his loan. The loans are subject to no other limitations than what arise from the value and the security of the pledge; every one being allowed to apply for and receive as much money as he is capable of laying down a lawful pledge for. The bank, however, lends no sum under 1000 rubles, and only by thousands, for the sake of avoiding perplexing accounts. The mortgaged property is subject to no suit, to no confiscation, nor to any demands from the crown or from private individuals. Every four years one part of the pawa is discharged, equal in value to that part of the capital already paid. The bank can redeem estates elsewhere mortgaged or appropriated to the payment of debts; and mortgaged estates may be sold; but in that case the purchaser takes upon himself all the obligations which the seller was under to the bank. The municipal magistrate vouches for the worth of the pledge; and must be responsible for it. The interest is paid annually. The bank gives ten days grace; whoever exceeds one month pays a flated penalty per cent. and this likewise holds good the second and third month. If payment be delayed beyond three months, the mortgaged estate is taken into charge by the noble court of wards. The interest and fines are paid from the income of the estate, and the remainder is paid to the proprietor. The inhabitants of towns obtain loans on their real estates, paying only 4 per cent. interest, and 3 per cent. capital, and are consequently freed from their debt in 22 years. Storche’s Pict. of Peterb. p. 211.

Bank of Philadelphia, called the bank of the United States, was founded in 1792, and incorporated by act of Congress, Febr. 25, 1791, under the latter appellation; and seems to have been successful; as it divides a profit of 8½ per cent. annually, paid half-yearly. Its capital stock was 10 millions of dollars. The stock-holders are to continue a corporate body by the act, until the 4th day of March, 1811; and are capable of holding property to an amount not exceeding, in the whole, 15 millions of dollars.

Bank of Stockholm owes its origin to Palmfhut, a merchant, who carried on an extensive trade, and possessed great property in iron mines. He established at Stockholm a bank for the purpose of exchanging and lending money, divided into two departments. Such was his credit, and such were his resources, that, though he was the only banker in the kingdom, and his connections of course very extensive, the notes which he issued at the interest of 8 per cent. for a term of ten years and upwards, were circulated through the kingdom, and received as cash at the trading part of the nation. In process of time, by the issue of counterfeit notes and other unfavourable circumstances, the bank was drained of cash, and its credit was in danger of sinking into disrepute. In this dilemma a Palmfhut applied to Charles XI., and induced the king to take the bank under his royal direction. Accordingly, the king appointed Palmfhut director, and having established the credit of the bank, transferred the direction of it to the states of the kingdom assembled in 1688; and declared himself and his successors protectors of the bank, but renounced all interference in the disposal of the money. The states being thus declared guarantors, proprietors, and directors of the bank, several regulations were made. The bank was permitted to lend money on good security, at the interest of 8 per cent. but to pay for all money borrowed only 6 per cent.; the debtors to discharge interest upon interest, but the bank not to pay interest upon interest; all the king’s revenues were to be deposited in the bank, without receiving interest. The bank was empowered to issue notes not exceeding the value of thirty-six dollars copper-mint, or ten shillings; and it was finally resolved, that the states, or those whom they should depute,
The Bank, should have the power of inspecting the accounts, and inquiring into the nature of its constitution. By these regulations, the credit and riches of the bank increased to such a degree, that towards the close of the 17th century, it became the universal depositary of the whole kingdom, both as to public and private circulation, and lowered the interest from 8 to 7, and afterwards to 6, 4½, and 3 per cent. In return, the interest for all money borrowed, or deposited in the bank by way of loan, was likewise levied from 6 to 4½, 3, and 2 per cent. The large quantity of copper money then current in the country, being, by its bulk and weight, extremely inconvenient, the circulation of bank notes became advantageous to commerce. From 1714 to 1717, the bank supplied Charles XII, with such considerable sums, that the revenues arising from the tolls and customs were insufficient to pay the interest, and of course there was a considerable deficiency. These supplies lowered the credit of the bank in the estimation of the public; and therefore the king on the remonstrance of the estates, mortgaged certain revenues of the crown, for the discharge of the interest; and declared that all the revenues then mortgaged should remain in the bank till the debt should be fully discharged; and also promised, that he would not, on any pretext or emergency, recur again to the bank for money, except for such as belonged to the crown. Its credit was thus in some measure retrieved; but its block was too far dwindled to repair its former credit, until Baron Goertz undignifiedly contributed to it by a scheme which was in every other respect detrimental to the nation. To supply Charles with money for his confluent wars, Goertz compelled persons by means of fines and penalties, and afterwards by a species of torture, to deliver up their plate, jewels, and coin. In return for these effects, they received copper-money, called "Mynteneller," or signs of coins, each weighing only one-thirtieth of a ducat, but pawning for a silver dollar, of which it was only a ninety-sixth part. The public secretly transferred their property, confiding of plate, jewels, and money, which was thus to be forced from them and exchanged for a debased currency, to the bank, confiding in the royal promise, that the bank should be exempted from the interference and inspection of the crown. Goertz advised the king to seize the property deposited in the bank; but Charles refused to violate his promise, and prohibited Goertz from making any proposals tending to the prejudice of the bank. In this crisis, the bank received such large sums of money, a great part of which paid no interest, that the profits were very confiderable. Accordingly the bank, in this flourishing state, was induced, by order of the estates, in 1741, to present the king with a donation of 100,000 silver dollars, or 8,333. 4s., and to furnish him with 500,000, or 41,666½, without interest, towards carrying on the war against Russia. Since that period it has frequently advanced large sums of money to the crown and to the board of manufactures, by order of the estates. The bank is divided into two departments;

Bank, Days in. See Day. 
Bank, Land, an institution projected during the years 1694 and 1695, by Dr. Hugh Chamberlain, for lending of money at a low interest on land security, which was the principal difference between this and the bank of England; in opposition to which corporation, then in its infancy and struggling with difficulties, this ill-judged project was set up. It was principally encouraged by the Tory party; and an act of parliament, viz. 7 & 8 W.III. c. 31, was obtained for the purpose. The subventions for its establishment failed, and the plan proved abortive. 

Bank Notes. See Note. 
Bank, or Bench, in Law. See Bank. 
Bank, Foot. See Banquett. 

Bank, in Natural History, denotes an elevation of the ground, or bottom of the sea, so as sometimes to surmount the surface of the water, or at least to leave the water shallow, as usually not to allow a vessel to remain afloat over it. In this sense, bank amounts to much the same as flath, shoal, &c. 

There are banks of sand, and others of stone, called also

Banks.
flame, and one greater pilot, proportioned where veffels By this the thou be to the thou, but cured at in world's

In part, these, or a large piece of that matter floating. See Icebergs.

Vapours at sea sometimes occasion such a deceptio misit, that mariners imagine they see land with trees, &c. They call such deceptions fog-banks. For the account of a remarkable deception of this kind, see Dr. Hawkworth's Account of the Voyages to the Southern Hemisphere, vol. i. p. c.

A long narrow bank is sometimes called a tide. The bank absolutely so called, or the main bank, or great bank, denotes that of Newfoundland, the scene of the cod-fishery. It is called the great bank, not only by reason of its vast extent, being, according to the English computation, two hundred miles long, and, according to the French, one hundred leagues, or three hundred miles; but also on account of several lesser banks near it, where cod are also caught. These last the French call banqueaux. This is one of those banks which have water enough to float a ship, and which, on this account, are not dangerous.

Banks are usually distinguished by a buoy, post, or the like. On charts, sand-banks are usually marked by little dots, and banks of stone by crosses. The colours of the buoys are also varied accordingly; sand-banks being denoted by light-coloured buoys, and rocks by black ones.

In large rivers, as the Elbe, &c. sand-banks, by high tides and inundations, are liable to change places; care is therefore taken to shift the buoys from time to time, to shoe the true channel of the river.

An exact knowledge of the banks, their extent, and the depth of water on them, makes the most essential part of the science of a pilot, and the matter of a ship: if the vessel be large, and draw much water, great attention will be necessary to keep clear of the banks: on the contrary, if it be small, the same banks afford a fair asylum, where it may brave the largest and stoutest vessels, which dare not follow it here. By means of this barrier, many a small craft has escaped its enemy.

Bank, in vessels which move with oars, is used for the bench where the rowers are seated; popularly called by our leaman, the thole.

In this sense we read of banks of galleys, of galleasses, of galleons, of brigantines, and the like.

The Venetian gondolas have no banks; for the watermen row flanking.

The common galleys have twenty-five banks, that is, twenty-five on each side, in all fifty banks, with one oar to each bank, and four or five men to each oar. The galleasses have thirty-two banks on a side, and fix or seven rowers to a bank. See Double-banked.

Bank also denotes an elevation of earth, fenes, flacks, or other materials in form of a wall, or causeway, to stop the waters, and prevent inundations.

These, on other occasions, are denominated damis, and sea-walls, &c. and by the ancients aggera; those on the coasts of Holland are more particularly denominated dykes. The belt bank, in the opinion of Dr. Hales, is that contrived by Dr. Wark of Scotland. A quantity of furze is fixed to the bottom of the channel, of such a breadth as is proportioned to the force which it is to resist. The said, or flame, will soon settle in the furze, and when this is covered, another bed of furze is to be laid on as before, and so on till the bank is raised to a sufficient height.

Bank is also used in several games, for the flock or fund of him who undertakes the game.

Bank at bill, a sum of money laid down by the tailors, before the gamblers, to answer all the winning cards that shall turn up in his course of dealing. Yet it is observed, that what the bankers gain per cent. of all the money adventure at pharo, is greater than that at board; being two pounds nineteen shillings and ten-pence per cent. in the first, and but fifteen shillings and three-pence in the second.

BANKER, in Commerce, a person who trafficks in money, and remits it from place to place, and supplies his correspondents or customers with money from the stock; deposited in his hands for bills of exchange and other securities. (See Banks.) The history of private banks is as follows. The royal mint in the tower of London had for some years before the year 1645, been made use of as a kind of bank, or depot for merchants to lodge their cash in. But king Charles the First having in that year made free with their money, the mint lost its credit. After this, the merchants and traders of London generally trusted their cash with their bankers, until the breaking out of the civil war, when it was very customary for apprentices and clerks to leave their masters and go into the army. Whereupon, in such unsettled times, merchants, not daring longer to confide in their apprentices, began about the year 1645, to lodge their necessary cash in goldsmith's hands, both to receive and pay for them; until which time, the whole and proper business of London goldsmiths was to buy and sell plate, and foreign coins of gold and silver, to melt and call them, to coin home at the mint, and with the rest to supply the refiners, plate-makers, and merchants, as they found the price to vary. This account of the matter we have from a scarce and most curious small pamphlet, published in 1676, intituled, "The Mystery of the new-fashion'd Goldsmiths, or Bankers discovered," in only eight quarto pages.

Bankers, on their first establishment, allowed to those who entrusted their money in their hands a moderate interest for the same, and hereby their business was very considerably increased, and rose to great reputation in the year 1667, when the Dutch burnt our ships at Chatham; but this event caused a run on the bankers, which hurt their credit, and in the year 1672, king Charles II. shut up the exchanger, and seized the money which the bankers had lent him at 8 per cent. interest, the whole sum amounting to 1,528,326l. The king was afterwards necessitated to pay six per cent. interest for this debt out of his hereditary excheque, but the principal was never paid. However, the parliament of 1720, cap. 12, provided for a large arrear of interest, and settled an interest of three per cent. for the future. The debt was hereby made redeemable, on paying one moiety of the principal sum, 1664, 261. farther confirmed by an act of 3 & 3 Anne, cap. 15, which moiety now became the proper debt of the public; and being reduced from six to five per cent. in 1717, was finally subscribed into the South-sea capital stock in the year 1720.

Bankers now allow no interest, and by investing a certain proportion of their capital in the funds, or laying it out on other sufficient security, and trafficking with it in the stocks, in discounts, &c. reap very considerable advantage from it; and by negotiating bills, &c. on the part of their creditors, greatly contribute to the convenience and dispatch of business.

When the people of any particular country, says Dr. Smith (ubi infra), have such confidence in the fortune, probity, and prudence of a particular banker, as to believe that he is always ready to pay upon demand such of his promissory notes as are likely to be at any time presented to him; those notes come to have the same currency as gold and silver money, from the confidence that such money can at any time he had for them.

A particular banker lends among his customers his own promissory notes, which are thus invested in all sorts of securities.
promissory notes, to the extent, we shall suppose, of a hundred thousand pounds. As those notes serve all the purposes of money, his debtors pay him the same interest as if he had lent them so much money. This interest is the source of his gain. Though some of those notes are continuously coming back upon him for payment, part of them continue to circulate for months and years together. Though he has generally in circulation, therefore, notes to the extent of a hundred thousand pounds, twenty thousand pounds in gold and silver may, frequently, be a sufficient provision for answering occasional demands. By this operation, therefore, twenty thousand pounds in gold and silver perform all the functions which a hundred thousand could otherwise have performed. The same exchanges may be made, the same quantity of consumable goods may be circulated and distributed to their proper consumers, by means of his promissory notes, to the value of a hundred thousand pounds, as by an equal value of gold and silver money. Eighty thousand pounds of gold and silver therefore, can, in this manner, be spared from the circulation of the country; and if different operations of the same kind should, at the same time, be carried on by many different banks and bankers, the whole circulation may thus be conducted with a fifth part only of the gold and silver which would otherwise have been requisite.

Let us suppose, for example, that the whole circulating medium of some particular country amounted, at a particular time, to one million sterling, that sum being then sufficient for circulating the whole annual produce of their land and labour. Let us suppose too, that some time thereafter, different banks and bankers issued promissory notes, payable to the bearer, to the extent of one million, referring in their different coopers two thousand thousand pounds for answering occasional demands. There would remain, therefore, in circulation, eight hundred thousand pounds in gold and silver, and a million of bank notes, or eighteen hundred thousand pounds of paper and money together. But the annual produce of the land and labour of the country had before required only one million to circulate and distribute it to its proper consumers, and that annual produce cannot be immediately augmented by these operations of banking. One million silver, therefore, will be sufficient to circulate it after them. The goods to be bought and sold being precisely the same as before, the same quantity of money will be sufficient for buying and selling them. The channel of circulation, if I may be allowed such an expression, will remain precisely the same as before. One million we have supposed sufficient to fill that channel. Whatever, therefore, is poured into it beyond this sum, cannot run in it, but must overflow. One million eight hundred thousand pounds are poured into it. Eight hundred thousand pounds therefore must overflow, that sum being over and above what can be employed in the circulation of the country. But though this sum cannot be employed at home, it is too valuable to be allowed to lie idle. It will, therefore, be sent abroad, in order to seek that profitable employment which it cannot find at home. But the paper cannot go abroad; because at a distance from the banks which issue it, and from the country in which payment of it can be exacted by law, it will not be received in common payments. Gold and silver, therefore, to the amount of eight hundred thousand pounds, will be sent abroad, and the channel of home circulation will remain filled with a million of paper, instead of a million of those metals which filled it before.

But though so great a quantity of gold and silver is thus sent abroad, we must not imagine that it is sent abroad for nothing; or that its proprietors make a pretest of it to foreign nations. They will exchange it for foreign goods of some kind or another, in order to supply the consumption either of some other foreign country, or of their own.

If they employ it in purchasing goods in one foreign country in order to supply the consumption of another, or in what is called the carrying trade, whatever profit they make will be an addition to the net revenue of their own country. It is like a new fund, created for carrying on a new trade; domestic business being now transacted by paper, and the gold and silver being converted into a fund for this new trade.

If they employ it in purchasing foreign goods for home consumption, they may either, first, purchase such goods as are likely to be consumed by idle people who produce nothing, such as foreign wines, foreign silks, &c.; or, secondly, they may purchase an additional flock of materials, tools, and provisions, in order to maintain and employ an additional number of industrious people, who re-produce, with a profit, the value of their annual consumption.

So far as it is employed in the first way, it promotes prodigality, increases expense and consumption, without increasing production, or establishing any permanent fund for supporting that expense, and is in every respect hurtful to society.

So far as it is employed in the second way, it promotes industry; and though it increases the consumption of the society, it provides a permanent fund for supporting that consumption, the people who consume, re-producing, with a profit, the whole value of their annual consumption. The gross revenue of the society, the annual produce of their land and labour, is increased by the whole value which the labour of those workmen adds to the materials upon which they are employed; and their next revenue by what remains of this value, after deducting what is necessary for supporting the tools and implements of their trade. Smith's Wealth of Nations, vol. i. p. 434, &c.

In Italy, the employment of a banker, especially in republics, does not derogate from nobility; and hence it is, that most of the cadets, or younger sons of persons of condition, undertake it for the support of their family. The nobility of Venice and Genoa were for a long time the chief bankers in the other countries of Europe.

The ancient bankers were called argentarii, and nummularii; and by the Greeks αργυροφόροι, κοσμολύται, and χρυσοποιοί. Their chief business was to put out the money of private persons to interest; they had their boards and benches for this purpose in all the markets and public places where they took in the money from some to lend it to others. The Romans had two kinds of bankers, though their office was much more extensive than that of the bankers among us, theirs being that of public officers, in whom were united the functions of a broker, agent, banker, and notary; managing the exchange, taking in money, affixing in buying and selling, and drawing up the writings necessary on all these occasions.

Bankers in the Court of Rome, are persons authorized, exclusive of all others, to solicit and procure by their correspondents at Rome, all bills, dispensations, and other acts dispatched at the papal curia, or in the legation of Avignon; they are dispersed in all the cities of France; where there is a parliament, or a presbytery; and were erected into a regular and hereditary office, by an edict in 1673. They owe their origin to the Guelphs, who took shelter at Avignon, and in other cities within the obedience of the pope, in the time of the civil wars in Italy. The favour they were in with the pontiffs, for having espoused the pa...
BAN

pi cance, occasioned their being employed in procuring expeditions of the court of Rome. But the heavy extortions they procured towards their clients, soon rendered them odious, and occasioned several denominations of reproach, as corrucci, corruccini, zaffazzini, carozzi, &c. from the city of Corfu, native place of Pope John XXII. in whose pontificate they were in their highest power. See Caracini. Bank, in Bricklaying, a piece of timber wherein they cut the bricks.

The banker is six feet long or more, according to the number of men to work at it, and nine or ten inches square; it is to be laid on two pieces of timber, three feet high from the floor they stand on.

Bank, in Sea Language, signifies a vessel employed in the cod-fishery on the banks of Newfoundland.

BANKES, Sir John, in Biography, lord chief justice of the common pleas in the reign of King Charles I., was descended from a good family at Keswick in Cumberland, and born there in the year 1632. In 1654 he removed to Queen's college, Oxford, and afterwards pursued the study of the law in Gray's inn. By his application and proficiency he acquired a reputation which recommended him to his Sovereign Charles I. who, in 1629, made him his attorney. In August 1634, he was knighted, and appointed to the office of attorney-general; from which office he was advanced, in 1640, to that of chief justice of the common pleas. In both these offices he acted with wisdom and integrity, and obtained universal approbation. So singular was his merit, that, though he decidedly took part with the king in his contest with the parliament, it was decreed by the latter, in 1643, that he might be continued in office. However, he soon after lost all his credit at Westminster; for he declared from the bench at Salisbury, that the actions of Essex, MancheSTER, and Waller, were treasonable, and the commons voted him and the rest of the judges who were of this opinion, traitors. Lady Bankes manifested extraordinary fortitude in the defence of Corr Castle in the isle of Purbeck, where Sir John and his family refided. When it was besieged by the parliamentary forces, she refused to surrender it, though she had about her only her children, a few servants and tenants, amounting at one time only to five and at most to no more than forty. When the town was obliged to surrender, and the besiegers became remiss under a notion that their business was completed, lady Bankes procured a supply of provision and ammunition, and was thus enabled to hold out till the siege was raised. Sir John remained with the king at Oxford, in the discharge of his duty as a privy-councillor, till his death, which happened in December 1644. By his will he bequeathed, besides other charities, an annuity of thirty pounds to the town of Keswick for the support of a manufacture of coarse cottons, which had been lately established, and which, without this aid, would have been lost. Sir John Bankes was distinguished for sound integrity, cool judgment, and an amiable temper. Biog. Brit.

BANKIANA, in Entomology, a species of Phalana (Lettius), named after Sir Joseph Bank; it inhabits the woods of England and Germany; is of a large size; and is distinguished by having the wings brown, with two very white bands, the posterior one undifferentiated. Fabricius.

Banking, in general, the making of banks to oppose the force of the sea, rivers, or the like, and secure the land from being overflowed thereby.

With respect to the water which is to be kept out, this is called banking; with respect to the land, which is hereby to be defended, imbanking.

Banking, in a Salt-works, the raising of a fence against the sea, whereby its waters may be kept out, excepting so much as is necessary for the preparation of the salt.

Bank, in Commerce. See Bank, and Banker.

BANKOK, or BANCO, in Geography, a town of Siam, at the mouth of the river Meamn, which discharges itself into the gulf of Siam.

Bankrupt, in Commerce and Law, a trader, who severs himself, or does certain other acts, tending to de-fraud, or injury, his creditors.

The word is formed from the ancient Latin bonens, a bench, or table, and ruptus, broken.

Bank, we have elsewhere observed, originally signified a bench, on which the first bankers had in the public places, in markets, fairs, &c. on which they told their money, wrote their bills of exchange, &c. Hence, when a banker failed, they broke his bank, to advertise the public, that the persons to whom the bank belonged was no longer in a condition to continue his business. As this practice was very frequent in Italy, it is said the term bankrupt is derived from the Italian banco rozzo, broken bench.

Cowell rather chuses to deduce the word from the French banque, table, and route, signification, trace, by metaphor from the sign left in the ground, of a table once fallen to it and now gone. On this principle he traces the origin of bankrupts from the ancient Roman messtarii, or argentarii, who had their tabernae or mensae in certain public places; and who, when they fled, or made off with the money that had been trusted to them, left only the sign or shadoe of their former station behind him. 4 Inf. 277.

And it is observable, that the title of the first English statute concerning this offence, 34 Hen. VIII. cap. 4, "Against such persons as do make bankrupt," is a literal translation of the French idiom qui font banque route.

A bankrupt was formerly considered merely as a criminal or offender (lat. 1. Jac. I. c. 15. § 17.) ; but at present the laws of bankruptcy are regarded as laws calculated for the benefit of trade, and founded on the principles of humanity as well as justice; and to that end, they confer some privileges, not only on the creditors, but also on the bankrupt himself:—on the creditors, by compelling the bankrupt to give up all his effects to their use, without any fraudulent concealment;—and on the debtor, by exempting him from the rigour of the general law, whereby his person might be confined at the discretion of his creditor, though in reality he has nothing to satisfy the debt; whereas the law of bankrupts, taking into consideration the sudden and unavoidable accidents to which men in trade are liable, has given them the liberty of their persons, and some pecuniary indemnities, upon condition of surrendering their whole estate to be divided among the creditors.

By the Roman law of the twelve tables, the creditors might cut the debtor's body into pieces, and each of them take his proportionable share: though some learned men have doubted whether the law " de debito in parte facendis," is to be understood in so very butcherly a light. There were also other laws, les inhuman, for imprisoning the debtor's person in chains, subjecting him to stripes and hard labour, at the mercy of his rigid creditor, and sometimes selling him, his wife and children, to perpetual foreign slavery " trans Tiberinam;" but this was an edification that produced many popular insurrections, and caused the " mons facer." In Pegu, and the adjacent countries in that nation, the creditor is entitled to dispossess the debtor himself, and likewise of his wife and children; infomuch that he may even violate with impunity the chastity of the debtor's wife; but then, by so doing, the debt is understood to be discharged.

In some places, bankrupts are condemned to wear
Our companionate and bankrupt. It is an advantage to the laws of bankruptcy—might be means of defending their landlords of the security which the laws have given them above all others, for the payment of their rents; wherefore also, upon a similar reason, a receiver of the king's taxes is not capable, as of a bankrupt, of setting aside the recoveries made against his debtors, which are put into his hands by the statutory. By the same statute, no person shall have a commutation of bankrupt awarded against him, unless at the petition of some one creditor to whom he owes £100; or of two, to whom he is indebted £50; or of more, to whom altogether he is indebted £200. For the law does not look upon persons, whose debts amount to less, to be traders considerable enough, either to enjoy the benefits of the statutes themselves, or to entitle the creditors, for the benefit of public commerce to demand the distribution of their effects.

In the interpretation of these several statutes, it hath been held, that buying only, or selling only, will not qualify a man to be a bankrupt; but it must be both buying and selling, and also getting a livelihood by it; as, by exercising the calling of a merchant, a grocer, a merchant, or, in one general word, a chapman, who is one that buys and sells any thing. But no handicraft occupation (where nothing is bought and sold, and where therefore an extensive credit for the stock in trade is not necessary to be had) will make a man a regular bankrupt; as that of a husbandman, a gardener, and the like, who are paid for their work and labour. Also an inn-keeper cannot, as such, be a bankrupt; for his gain or livelihood does not arise from buying and selling in the way of merchandize, but in a great degree from the use of his rooms and furniture, his attendants, and the like; and though he may buy corn and victuals, to sell again at a profit, yet that no more makes him a trader, than a schoolmaster or other person is, that keeps a boarding-house, and makes considerable gains by buying and selling what he buys and sells in the house; and such a one is clearly not within the statutes. But where a person buys goods, and makes them up into saleable commodities, as shoe-makers, smiths, and the like; here, though part of the gain is by bodily labour, and not by buying and selling, yet they are within the statutes of bankrupts; for the labour is only in embellishment of the commodity, and rendering it more fit for sale.

One single act of buying and selling will not make a man a trader; but a repeated practice, and profit by it. Buying and selling bank-stock, or other government securities, will not make a man a bankrupt: they not being goods, wares, or merchandize, within the intent of the statute, by which a profit may be fairly made. Neither will buying and selling under particular restraints, or for particular purposes; as, if a commissioneer of the navy uses to buy victuals for the fleet, and dispose of the surplus and surplus, he is not thereby made a trader within the statute. An infant, though a trader, cannot be made a bankrupt; for an infant can owe nothing, but for necessaries, and the statutes of bankruptcy create no new debts, but only give a speedy and more effectual remedy for recovering such as were before due; and no person can be made a bankrupt for debts which he is not liable at law to pay. But a feme covert in London, being a sole trade.
BANKRUPT.

And, first, there must be a petition to the lord chancellor by one creditor to the amount of 100l., or by two to the amount of 150l., or by three or more to the amount of 200l.; which debts must be proved by affidavit; upon which he grants a commissione to such discreet persons as to him shall seem good, who are then declared commissioners of bankrupt. The petitioners, to prevent malicious applications, must be bound in a security or bond to the lord chancellor of 200l., to make the party amends in case they do not prove him a bankrupt. And if on the other hand they receive any money or effects from the bankrupt, as a remuneration for fixing out the commissione, so as to receive more than their rateable dividends of the bankrupt's estate, they forfeit not only what they shall have so received, but their whole debt. These provisions are made, as well to secure persons in good credit from being damaged by malicious petitions, as to prevent knavery combinations between the creditors and bankrupt, in order to obtain the benefit of a commissione. When the commissione is awarded and issued, the commissioners are to meet, at their own expense, and to take an oath for the due execution of their commissione, and to be allowed a sum not exceeding 20s. per diem each, at every sitting. And no commissione of bankrupt shall abate, or be void, by the death of the bankrupt, subsequent to the commissione, St. 1 Jac. I. c. 15; nor upon any demise of the crown, St. 5 Geo. II. c. 33. The granting of a commissione of bankruptcy is not discretionary, but a matter of right. 1. Vern. 153. Stat. 13 Eliz. c. 7.

When the commissioners have received their commissione, they are first to receive proof of the person's being a trader, and having committed some act of bankruptcy; and then to declare him a bankrupt, if proved for; and to give notice thereof in the gazette, and at the same time to appoint three meetings. At one of these meetings an election must be made of almsmen. And at the third meeting, at farthest, which must be on the forty-second day after the advertisement in the gazette (unless the time be enlarged by the lord chancellor), the bankrupt, upon notice also personally served upon him or left at his usual place of abode, must surrender himself personally to the commissioners; which surrender (if voluntary) protects him from all arrests till his final examination is past; and he must thenceforth in all respects conform to the directions of the statutes of bankruptcy; or, in default of either surrender or conformity, shall be guilty of felony without benefit of clergy, and shall suffer death, and his goods and estate shall be distributed among his creditors. St. 5 Geo. II. c. 32.

I shall, by and by, speak of the effect of bankruptcy. In the case of bankruptcy abidings, or is likely to run away, between the time of the commissione issued, and the last day of surrender, he may by warrant from any judge or justice of the peace be apprehended and committed to the county gaol, in order to be forthcoming to the commissioners; who are also empowered immediately to grant a warrant for seizing his goods and papers. St. 5 Geo. II. c. 32.

When the bankrupt appears, the commissioners are to examine him touching all matters relating to his trade and effects. They may also summon before him, and examine the bankrupt's wife, and any other person whatsoever, as to all matters relating to the bankrupt's affairs. And in case of them all shall refuse to answer, or shall not answer fully to any lawful question, or shall refuse to subscribe such their examination, the commissioners may commit them to prison without bail, till they submit themselves and make and sign a full answer; the commissioners specifying in their warrant of commitment the question to be refuted.
BANKRUPT.

The bankrupt, upon this examination, is bound upon pain of death to make a full discovery of all his plate and effects, as well as in respect to any books and writings relating thereto; and is to deliver up all in his own power to the commissioners (except the necessary apparel of Linen, his wife, and his children); or, in case he conceals or embezzles any effects to the amount of 20l. or withholds any books or writings, with intent to defraud his creditors, he shall be guilty of felony without benefit of clergy; and his goods and estate shall be divided among his creditors. And unless it shall appear, that his inability to pay his debts arose from some lawful loss, he may, upon conviction by indictment of such gross misconduct and negligence, be set upon the pillory for two hours, and have one of his ears nailed to the fence and cut off. Stat. 5 Geo. II. c. 30.

After this affidavit is made to the bankrupt for such discovery is expired, any other person voluntarily discovering any part of his estate, before unknown to the affigees, shall be entitled to 5 per cent. out of the effects so discovered, and such further reward as the affigees and commissioners shall think proper. And any tradesmen, wilfully concealing the estate of any bankrupt, after expiration of the two and forty days, shall forfeit 10s. and double the value of the estate concealed to the creditors. Stat. 5 Geo. II. c. 30.

Hitherto every thing is in favour of the creditors; and the law seems to be pretty rigid and severe against the bankrupt; but, in case he proves honest, it makes him full amends for all this rigour and severity. For if the bankrupt hath made an ingenious discovery of the truth and fullness of which there remains no doubt, and hath conformed in all points to the directions of the law; and if, in consequence thereof, the creditors, or four parts in five of them in number and value (but none of them creditors for less than 20l.), will sign a certificate to that purport; the commissioners are then to authenticate such certificate under their hands and seals, and to transmit it to the lord chancellor; and he, or two of the judges whom he shall appoint, on oath made by the bankrupt that such certificate was obtained without fraud, may allow the same; or dismiss it, upon cause shown by any of the creditors of the bankrupt. Stat. 5 Geo. II. c. 30.

If no cause be shown to the contrary, the certificate is allowed of course; and then the bankrupt is entitled to a decent and reasonable allowance out of his effects, for his future support and maintenance, and to put him in a way of honest industry. This allowance is also in proportion to his former good behaviour, in the early discovery of the decline of his affairs, and thereby giving his creditors a larger dividend. For, if his effects will not pay one half of his debts, or ten shillings in the pound, he is left to the direction of the commissioners and affigees, to have a competent sum allowed him, not exceeding 3 per cent.; but if they pay ten shillings in the pound, he is to be allowed 5 per cent.; if twelve shillings and six-pence, then 7½ per cent.; and if fifteen shillings in the pound, then the bankrupt shall be allowed 10 per cent.: provided, that such allowance do not in the first effect exceed 200l., in the second 250l., and in the third 300l. Stat. 5 Geo. II. c. 30.

Besides this allowance, he has also an indemnity granted him, of being free and discharged for ever from all debts owing by him at the time he became a bankrupt; even though judgment shall have been obtained against him, and he be in prison upon execution for such debts; and, for that among other purposes, all proceedings on commitments of bankrupt are, on petition, to be entered of record, as a perpetual bar against actions to be commenced on this account; though, in general, the production of the certificate properly allowed shall be sufficient evidence of all previous proceedings. Stat. 5 Geo. II. c. 30.

The certificate, when allowed, will not discharge the penalties of a bankrupt; but if he obtains it before his bail are fixed, it will discharge them: whereas if not till after they are fixed, they will remain liable withstanding the certificate: and if the creditor prove his debt, with intent to obstruct the certificate, it does not preclude him from pursuing his legal remedies: and even if he had received his debt or part of it, under the commission, still he might proceed to fix the bail who would be entitled to the remedy, so far as they are approbated, by "audita querela," or by "motion." (1 Ath. 84. 1 Burr. 244. 2 Burr. 716.)

The certificate does not discharge a bankrupt from his own collateral contract, which does not run with the land (2 Burr. 2443.) nor from a covenant to pay rent. (4 Term. Rep. 94.) A bankrupt, after a certificate of bankruptcy is fixed out, may, in consideration of a debt due before the bankrupt, and for which the creditor agrees to accept no dividend or benefit under the commission, make such creditor a satisfaction, in part, or for the whole of his debt, by a new undertaking or agreement; and "assumpsit" will be upon such new promise or undertaking. (1 Ath. 67.) Although a creditor of a bankrupt under 20l. is excluded from affidavit or the certificate, yet as he is affected by the consequence of allowing the certificate, he has a right to petition and have any fraud against allowing the certificate. 7 Vin. Abr. 134. pl. 18.

No allowance or indemnity shall be given to a bankrupt, unless his certificate be signed and allowed; and also, if any creditor produces a fictitious debt, and the bankrupt does not make discovery of it, but suffers the fair creditors to be imposed upon, he loseth all title to these advantages. Neither can he claim them, if he has given with any of his children above 100l. for a marriage portion, unless he had at that time sufficient left to pay all his debts; or if he has lost at any one time 5l. or in the whole 100l. within a twelve-month before he became bankrupt, by any manner of gaming or wasting whatsoever; or, within the same time, has lost to the value of 100l. by block-jobbing. Also to prevent the too common practice of frequent and fraudulent or careles breaking, a mark is set upon such as have been once cleared by a commission of bankrupt, or have compounded with their creditors, or have been delivered by an act of insolvency. Persons who have been once cleared by any of these methods, and afterwards become bankrupts again, unless they pay full fifteen shillings in the pound, are only thereby indemnified as to the confinement of their bodies; but any future estate they shall acquire remaining liable to their creditors, excepting their necessary apparel, household goods, and the tools and implements of their trades. Stat. 5 Geo. II. c. 30. 24 Geo. II. c. 57.

By the statute 13 Eliz. c. 7, the commissioners for that purpose, when a man is declared a bankrupt, shall have full power to dispose of all his lands and tenements, which he had in his own right at the time when he became a bankrupt, or which shall descend or come to him at any time afterwards, before his debts are satisfied or agreed for; and all lands and tenements which were purchased by him or for him.
jointly with his wife or children to his own use (or such interest therein as he may lawfully part with), or purchased with any other person upon secret trust for his own use; and to cause them to be appraised to their full value, and to sell the same by deed indented and enrolled, or divide them proportionally among the creditors. This statute expressly included not only free, but customary and copyhold, lands; and the lord of the manor is then by bond to admit the assignee (Cros. Car. 558. 1 Atk. 96); but did not extend to estates-tail, further than for the bankrupt's life; nor to equities of redemption on a mortgaged estate, wherein the bankrupt has no legal interest, but only an equitable reversion.

Whereupon the statute 11 Jac. I. c. 19. enacted, that the commissioners shall be empowered to sell or convey, by deed indented and enrolled, any lands or tenements of the bankrupt, whereon he shall be holder of an estate-tail in possession, remainder, or reversion, unless the remainder or reversion thereof shall be in the crown; and that such sale shall be good against all such interests in tail, remaindermen, and reversioners, whom the bankrupt himself might have barred by a common recovery, or other means; and that all equities of redemption upon mortgaged estates, shall be at the disposal of the commissioners; for they shall have power to redeem the same, as the bankrupt himself might have done, and after redemption to sell them. And the commissioners may sell a copyhold entailed by custom. (Stone 127. Billing 135.) And also, by this and a former act, all fraudulent conveyances to defeat the intent of these statutes are declared void; but that no purchaser bona fide, for a good or valuable consideration, shall be affected by the bankrupt laws, unless the commissio be fixed forth within five years after the act of bankruptcy committed. 1 Jac. I. c. 15.

By virtue of these statutes a bankrupt may lose all his real estates; which may at once be transferred by his commissioners to their assignees, without his participation or consent. See Assignees.

The property vested in the assignees is the whole that the bankrupt had in himself, at the time he committed the first act of bankruptcy, or that has been vested in him since, before his debts are satisfied or agreed for. And therefore, if a commission is afterwards awarded, the commissio and the property of the assignees shall have a relation, or reference, back to the first and original act of bankruptcy. Inasmuch that all transactions of the bankrupt are from that time absolutely null and void, either with regard to the alienation of his property, or the receipt of his debts from such as are privy to his bankruptcy; for they are no longer his property or his debts, but those of the future creditor. If a banker pay the draft of a trader keeping cash with him, after knowledge of an act of bankruptcy, the assignees may recover the money. (2 Term Rep. 113. 3 Bro. C. R. 312.) And if an execution be fixed out, but not served and executed on the bankrupt's effects till after the act of bankruptcy, it is void as against the assignees. But the king is not bound by this fictitious relation, nor is within the statutes of bankrupts; for if, after the act of bankruptcy committed and before the assignment of his effects, an extent issues for the debt of the crown, the goods are bound thereby. As these acts of bankruptcy may sometimes be secret to all but a few, and it would be prejudicial to trade to carry this notion to its utmost length, it is provided by statute 19 Geo. II. c. 32. that no money paid by a bankrupt to a bona fide or real creditor, in a course of trade, even after an act of bankruptcy done, shall be liable to be refunded. Nor, by statute 1 Jac. I. c. 15. shall any debtor of a bankrupt, that pays him his debt, without knowing of his bankruptcy, be liable to account for it again. The intention of this relative power being only to reach fraudulent transactions, and not to disturb the fair trader.

Sale of goods by a bankrupt, after an act of bankruptcy, is not merely void; the contract is good between the parties; but it may be avoided by the commissioners or assignees at pleasure; so that they may either bring trover for the goods, as supposing the contract may be void, or may bring debt or assumpsit for the value, which affirms the contract. (3 Salk. 59. 21 T. R. 413. 4 T. R. 216. 7.) And so if a bankrupt on the eve of bankruptcy fraudulently deliver goods to a creditor. (4 Term Rep. 211.) The assignees after four, and within twelve months after the commission issued, must give twenty-one days notice to the creditors of a meeting for a dividend; at which time they must produce their accounts, and verify them upon oath, if required. And then the commissioners shall direct a dividend to be made, at so much in the pound, to all creditors who have before proved, or shall then prove, their debts. This dividend must be made equally, and in a rateable proportion, to all the creditors, according to the quantity of their debts; no regard being had to the quality of them. Mortgages indeed, for which the creditor has a real security in his own hands, are entirely safe; for the commission of bankruptcy reaches only the equity of redemption. So are also personal debts, where the creditor has a chattel in his hands, as a pledge or pawn for the payment, or has taken the debtor's lands or goods in execution. And, upon the equity of the statute 8 Ann. c. 14. (which directs, that, upon all executions of goods being on any premises demised to a tenant, one year's rent and no more shall, if due, be paid to the landlord) it hath also been held, that under a commission of bankrupt, which is in the nature of a statute-execution, the landlord shall be allowed his arrears of rent to the same amount, in preference to other creditors, even though he hath neglected to distrain, while the goods remained on the premises: which he is otherwise entitled to do for his entire rent, be the quantum what it may. But, otherwise, judgments and recognizances (both which are debts of record, and therefore at other times have a priority), and also bonds and obligations by deed or special instrument (which are called debts by specialty, and are usually the next in order), these are all put on a level with debts by mere simple contract, and all paid pari passu. Nay, so far is this matter carried, that, by the express provision of the statutes, debts not due at the time of the dividend made, as bonds or notes of hand payable at a future day certain, shall be proved and paid equally with the rest, allowing a discount or drawback in proportion. And informations, and obligations upon bottomry or respondentia, bona fide made by the bankrupt, though forfeited after the commission is awarded, shall be looked upon in the same light as debts contracted before any act of bankruptcy. Stat. 21 Jac. c. 19. 7 Geo. I. c. 31. 19 Geo. II. c. 32. Within eighteen months after the commission issued, a second and final dividend shall be made, unless all the effects were exhausted by the first. And if any surplus remains, after selling his estates and paying every creditor his full debt, it shall be restored to the bankrupt. This is a case which sometimes happens to men in trade, who involuntarily, or at least unwarily, commit acts of bankruptcy, by abjuring and the like, while their effects are more than sufficient to pay their creditors. And, if any fraudulent or malevolent creditor will take the advantage of such acts, and sue out a commission, the bankrupt has no remedy, but must quietly submit to the effects of his own imprudence;

Species, 1. B. ferráta, ferrate-leaved bankfa. White Voy. 223. fig. 1, 2, 3. B. concífera. Gért. fruct. 221. t. 48. f. 1. "Leaves linear, attenuated into the petiole, equally ferrate, truncate at the end with a point." This is the handfolièt species of the genus; trunk thick and rugged; leaves alternate, thick at the ends of the branches, on short pedioles, obuf. ferrate, bright green above, beneath opaque and whitish, with a strong rib running through their middle; each branch terminated by a large cylindrical spike of flow- ers; the capsules covered with thick down; the flowers and fruits collected into a large globular ament; the seed in each cell of the capsule fagie, rather large, winged and dark brown. 2. B. integérfolíá, entire-leaved B. B. ferráta. Gért. fruct. 221. t. 48. f. 2. "Leaves wedge-form, quite entire, white-tomentose underneath." The flowers and fruits are collected into a cylindric ament; and before they are ripe, are pubescent with a map of snowy white fistros; capsule coriaceous, orbiculate at top, turbidly lens-shaped, and continued at bottom into a conical, compressed back; within, black, two-celled, and gaping at the tip. 3. B. erícésfolia, heath-leaved B. "Leaves approximating, acerose, truncate-emarginate, smooth." The leaves are very small, but more abundant than those of the preceding species. 4. B. dentáta, tooth-leaved B. "Leaves oblong, attenuated into the petiole, curved, flexuose, toothed, teeth ending in an spindle, white underneath." The flowers of this species are smaller than in the others. 5. B. pyriformis, pear- fruited B. "Flowers solitary; capsules ovate, pubescent; leaves. 
leaves lanceolate, very entire, smooth." The capsules are larger than in any other known species, one-celled, and opening longitudinally on the lower side; there are two seeds of a rusby cinnamon colour, convex on one side and flat on the other, with a long membranaceous, vein-like wing.

6. B. gibbosa, gibbous-fruited B. B. dasyblatis, Gartn. 221. t. 47. f. 2. "Flowers solitary; capsules ovate, gibbous, wrinkled; leaves columnar." Leaves about two inches long, and one line in diameter, pale green, and smooth. Dr. Smith says that the B. dasyblatis of Gaertn and this are different species. 7. B. microphylla, microphyllous. "Flowers solitary; capsules ovate-conical, microphyllous, pointed, with tubercles on the outside; leaves oblong, emarginate." Leaves alternate, from six to eight inches long, and three broad; flowers in a short simple raceme, in which only one or two fruits ripen; the capsule from one to two inches or more in length, woody, with roundish tubercles, variegated brown and dull colour, one-celled; the seeds are two and dark bay. 8. B. spinulosa, prickly-leaved. "Leaves linear-obovate, with a little sharp point, and with spiny denticulation towards the top." Stem woody and branched; leaves irregularly parted, closely covering the branches, on very short footstalks, green and smooth above, white and downy beneath, ending abruptly, tipped with three small spines, and having several hooked upwards in the margin; flowers thick set in a cylindrical erect spike, coming out in pairs. It differs from B. crista-flos, in having leaves at least four times as long, oblong, but with a small central sharp point from the middle between two other terminal points, as well as in being a greater or less number of small sharp-hooked lateral teeth towards the end of each leaf. The inhabitants of New South Wales call it "Wattangre." All these plants are natives of that country, except the 7th, which Rumplius observed in Ambon, in 1693. This genus is nearly allied to Protoc and Embatoc, in appearance and character, but sufficiently distinguished from both in the fruit. It bores some of the most fiesious plants that have been discovered in the South seas, and even in the known world. Those with solitary flowers and one-celled capsules (5, 6, 7.) form a separate genus, which Dr. Smith names Salisbaria; which see.

Propagation and Culture. Some of the species have flowered and seeded here; they have been increased merely by seeds. Those, and the plants in general from the South seas, are hardy, confiding their climate, and may be treated much in the same manner with the Cape plants; they covet much air, and flourish best near the front of the dry side.

Banksia, Forsk. See Pimelea.

Banksia Alpina, or Cusgo, so called by Mr. Bruce after Mr. Joseph Banks, an inhabitant of the high country of Abyssinia, and indigenous there. Mr. Bruce, who has described and given a drawing of it, and who represents it as one of the most beautiful and useful trees, says, that he never saw it in the Kolla nor in Arabia, nor in any other part of Asia or Africa. It seldom grows above 20 feet high, and generally inclined; its leaf is about two inches and a quarter long, divided into two by a strong rib; its colour is a deep unvarnished green, very plesant to the eye, and the fore-part is covered with soft hair or down; it is much indented, and refembls a nettle leaf, only that it is narrower and longer.

The leaves grow alternately by pairs upon a branch terminating with a single leaf at the point; the end of the leaf is broad and strong, like that of a palm-branch; and it opens in the part that is without leaves, about an inch and a half from the bottom, and from this aperture proceeds the flower. The whole cluster of flowers has very much the shape of a cluster of grapes, and the leaf that supports it resembles the leaf of the grape; the flower itself is of a greenish colour, tinged with purple; when fully blown, it is altogether of a deep red or purple; the corolla consists of five petals, with a short pistil in the middle, having a round head, and surrounded by eight filaments of the same form, loaded with yellow farina. The calyx consists of five petals, which much resemble another flower; they are rounded at the top, and nearly of an equal breadth every way. The bark of the tree is smooth, of a yellowish white, interpersed with brown streaks which pass through the whole body of the tree. On the upper part, before the first branch of leaves let out, are rings round the trunk of small filaments of the confidence of horse-hair; these are generally 14 or 16 in number, and are a very remarkable characteristic belonging to this tree. The tree is always planted near churches for the use of the town or village; and it is very serviceable as an antidote to a disorder to which the Abyssiains of both sexes and at all ages are subject. Every individual once a month evacuates a large quantity of worms of the kind called all对应的；和the method of promoting the evacuations is by infusing a handful of dry Cuffio flowers in about two English quarts of bouza, or the beer that is made from teff; after it has been steeped all night, it is next morning fit for use. The seed of this tree is very small, fmer than the femen Santonicum; it is easily dried; and on this account no greater quantity of the seed is gathered, and therefore the flower is subsidized for it. It is bitter, but much less so than the femen Santonicum.

Mr. Bruce conceives that this plant may be found in latitudes 11° or 12° north in the West Indies or America; and having been found a gentle, safe, and efficacious medicine in Abyssinia, it is not doubted but the superior skill of physicians would turn it to the advantage of mankind in general, when used here in Europe.

Banksia, in Entomology, a species of Papilio (Nymph.) with angulated wings; above brown, with a yellowish diffuse, and a black ocular spot with a double pupil. Fabricius. This is a native of New Holland, and is the Papilio I. mene of Cranmer.

BANKSII, a species of Scarabceus (Melontha) decribed by Fabricius from a specimen in the museum of Sir Joseph Banks. The head and thorax are black; wing-cases violet, and with the legs talaaceous; abdomen short and retuse.

Banksia, a species of Cinex, (Reduvius) that inhabits India. It is rufous above, with black wings, abdomen deep black; border rufous. Fabricius.

Banksia, a species of Chrysonoea that inhabits Calabria. It is brightly coloured, and is not very necessary. Fabricius.

Banksia, a species of Carabinae (Latin). It is that found at the Cape of Good Hope. It is of a greyish colour; thorax slightly spinous; wing-cases speckled with ferruginous, and marked with two cinereous bands. Fabricius.

BANLEUGA, or Bannileuga, or Bannie, in Middle Age Writers, the territory within which the jurisdiction of municipal magistrates, or ordinary judges of a city, town, or the like, is confined.

It is thus called, because within this tract they may make their proclamations, prohibitions, and other acts of justice and policy, comprised under the name of Ban, or Ban-

BANN, in Geography, a river in Ireland, which rises in the
the northern part of the Mourne mountains, in the county of Down, and twilled by various little brooks, soon becomes a large stream. It takes a serpentine course to the north-west, having many bridges over it, till it comes to Portadown, where it is joined by the Newry canal, and a few miles farther it falls into Lough Neagh at Bannfoot ferry, after running about thirty miles. The waters of this river, which is distinguished by the name of the South or Upper Bann, are acclaimed superior to any other for the purpose of bleaching. After passing through Lough Neagh, out of which it breaks at Toome castle, where is a bridge over it, it again expands into a small lake called Lough Beg, the views in which are very pleasing. From this, still keeping a north-west direction, it passes through a country formerly overgrown with immense woods, then forces its way over a ridge of rocks called the Salmon-leap, and having again collected its scattered waters, rushes with an impetuous force into the sea at Banbavan, a few miles below Coleraine. It is certainly one of the finest rivers in Ireland; and if we include its passage through the lake, runs in the whole near ninety miles, with fo pure and limpid a stream, that it has acquired the name of "the fairer Bann." The lower or northern part of it, being the only outlet for seven rivers and innumerable streams that pour their tributary waters into Lough Neagh, is broad and rapid; but notwithstanding this, and the ridge of rocks already mentioned, it is thought that it might be rendered navigable, a measure from which great advantages are expected. The salmon caught in this river is very highly esteemed, and the fisheries is the greatest in the kingdom. (See COLENAINE.) Campbells Political Survey. Beaumont's Memoir. Young's Tour, &c.

Bann, the name of a river in the north-eastern part of the county of Wexford, Ireland, which falls into the Stoney near Ferna.

Bann, a township in the county of York, in Pennsylvania.

Bann, or Ban, Bannum, or Bannus, in the Feudal Law, a solemn proclamation, or publication of any thing.

The origin of the word is uncertain: some deduce it from the Britsh bann, clamour, noise; others from the Saxon pan, a thing spread; whence ban and band, used for a flag. Draxon mentions bannus regis for a proclamation of silence anciently made by the court, before the encounter of the champions in a combat.

Bann is also used for a solemn convocation of the nobility of a province, to attend the king in his army, conformably to their several tenures.

Bann, in this sense, differs from rear-bann; as the former respects those who hold medially of it. But the words are now confounded; and bann and rear-bann denote a summons to all the feudal tenants, mediate and immediate, to go to war in the king's service.

Bann also denotes the assembly, or body of nobility and gentry thus convocated.

In this sense, they say, the bann and rear-bann are long in getting into the field; the bann and rear-bann were assembled, &c.

The French nobility appear to have served the king, in the way of bann and rear-bann, from the beginning of the monarchy; though the usage was not regularly settled till the time of the infeudation of fiefs.

Bann is more particularly used to denote a procuration or beainment, for a crime proved; because anciently published by loud of trumpet; or, as Voltaire thinks, because those who did not appear at the above mentioned demumns were punished by procuration.

Hence, to put a prince under the bann of the empire, is to declare him divested of all his dignities.

The sentence only denotes an interdiction of all intercourse and actions of humanity with the offender, the form of which seems taken from that of the Romans, who banished perfons, by forbidding them the use of fire and water.

Sometimes also cities are put under the imperial bann; that is, stripped of their rights and privileges.

Bann also denotes a pecuniary mulct or penalty laid on a delinquent for offending against a bann.

Banns of Marriage are certain solemn notices of matrimonial contracts made, in the parish church, before the marriage; that if there be any objections to either party as to prior engagements, &c. there may be an opportunity of making them. The publication of banns (popularly called asking in the church) was intended as an expedient to prevent clandestine marriages; but a licence or dispensation is now easily procured, so that their use is defeated. By the laws of the church, banns are to be published thrice, on three distant days, in the places where the parties live; or pain of excommunication and excommunications are threatened against those, who knowing the banns, conceal them. (But see 26 Geo. II. cap. 23, and Marriages.) The use of matrimonial banns is said to have been first introduced in the Gallican church, though something like it obtained even in the primitive times; and it is this Tertullian is supposed to mean by trinunina promulgatio.

Bann is also used for a solemn anathema, or excommunication, attended with curses, &c.

In this sense, we read of papal banns, &c.

Bann of God, bannus Dei, or the judgment of God. Spelman takes it for excommunication.

Bann is also used for a prohibition.

In which sense, the ban of harrest or vintage, &c. in the French customs, imports a prohibition to reap, or gather the grapes, without the leave of the lord.

The former is now taken away, and the reaper may reap his corn when he pleases; but the latter still remains, perfons not being allowed to open the vintage till publication is made by the officer of the place for that purpose.

Bann-Vin, in the French Customs, a privilege enjoyed by lords, of selling the wine of their own growing, during a certain time, exclusive of all other persons within the compass of their fees or lordships.

The same right, in some places, extends also to other liquors; and even to hogs, cows, and other animals.

BANNALEC, in Geography, a town of France, in the department of Finisterre, and chief place of a canton in the district of Quimperlé; 21 leagues north-west of Quimperlé. The place contains 4750; and the canton 3950 inhabitants; the territory includes 195 kilometres, and four communes.

BANALIS MOLA, or Bannal-mill, a kind of feudal toll, whereby the tenants of a certain district are obliged to carry their corn to be ground at a certain mill, and to be baked at a certain oven, for the benefit of the lord.

The oldest account of such bannal-mills occurs in the eleventh century. Fulbert, bishop of Chartres, and chancellor of France, in a letter to Richard, duke of Normandy, complains, that attempts began to be made to compel the inhabitants of a part of that province to grind their corn at a mill situated at the distance of five leagues. Vid. "Maxima Bibliotheca Veterum Patrum." Lugdun. 1675, tom. xviii. p. 9. Other examples of this species of servitude, in the tenth and eleventh centuries, may be seen in Da Pufine, under "Moleculum Bannale," De la Mare "Traite de la Police," ii. p. 151.) gives an instance, where a lord in a
churing his subjects, A. D. 1248, required of them, in re-
membrance of their former submission, and that he might
draw as much from them in future as possible, that they
should agree to pay a certain duty, and to send their corn to
be ground at his mill, their bread to be baked in his oven,
and their grapes to be pressed at his wine-press. The origin
of these servitudes may possibly be accounted for thus: the
building of mills was at all times expensive, and undertaken
only by the rich; who, to indemnify themselves for the
money expended in order to benefit the public, stipulated
that the people in the neighbourhood should grind their corn
at no other mills than those erected by them.

BANNER, in Geography, a town of Hindooelan, in the
district of Coorg-wynaad, seated on the upper branch of
the Copyun river. N. lat. 11° 48'. E. long. 76° 26'.

BANNAT of Temeswar, a district of Upper Hungary,
in the circle on the farther side of the Thiès, bounded by
the rivers Mares, Theis, and Daruloe, and watered by the
Temes, which is joined by the Beg or Beno. In 1552,
the Turks became masters of it, and retained it at the peace
of Karlowitz, in 1699; but lost it, after a possession of 165
years, in 1716; and in 1718, it was formally ceded to the
emperor, at the peace of Passarowitz; which cession, one
district excepted, which was granted to the Turks, was rati-
fied in 1739, at the treaty of Belgrade. Its government
is divided into the civil and military jurisdiction. Its capital
is Temeswar. This banner prefaces many ridges of consid-
erable height.

BANN-BRIDGE, a market and post-town of the
county of Down, province of Ulster, Ireland, which takes
its name from a bridge over the river Dann. It is a pleasant
town on the road from Dublin to Belfast, and is remarkable
for its great linen fairs. Distance north from Dublin 60
Irish miles.

BANNER, in Heraldry, is a small square flag with fringe,
skirted by a lace or frill, similar to the standards now borne
by the regiments of cavalry, and was always borne in the field
before a prince, duke, marquis, earl, viscount, baron, knight,
of the garter, and knight-banneret.

Menage derives the word from the Latin bandum, a band,
or flag; and supposes banniere to have been first written for
bandiere; which is confirmed by this, that we meet with the
word banderia, used, in the same sense, by Latin writers of
the barbarous age.

In the reign of Henry VIII. the size of the royal ban-
er was an ell long, and a yard broad; in queen Elizabeth’s
reign, the length was two yards and a half, and the breadth
two yards, beside the fringe; the complement of men to
each banner in the field was always one hundred.

BANNERS, in Military Language. See Colours.

BANNEtets, an ancient order of knights, or feudal
lords, which, by permitting several large fees, led their vassals
to battle, under their own flag, or banner, when summoned
thereby the king.

The word seems formed from banner, a square flag, or
from land, which anciently also denoted a flag. — Bannerets
are also called in ancient writers, militae vexillarii, and vex-
illarii, bannerarii, bannerifs, &c.

Anciently there were two kinds of knights, great and
little, the first whereof were called Bannerets, the second
Bachelors; the first composed the upper, the second the
middle, nobility.

The banneret was a dignitary allowed to march under his
own flag, whereas the baccellarius eques followed that of an-
other. Knights bannerets were originally entitled to display
their banners in the field. A knight Banneret must be a gen-
tleman of family, and have land sufficient to enable him to
bring into the field fifty men at arms, with the archers and
cross-bowmen appertaining thereto, making in the whole
one hundred.

Banneret, according to Spelman, was a middle order be-
tween a baron and a simple knight; called sometimes also
vexillarius minor, to distinguish him from the greater, that is,
from the baron, to whom alone properly belonged the jus
vexilli, or privilege of the square flag.

Hence the banneret was also called bannaretus, quae horo
minor, a word frequently used by English writers in the same
sense as banneret was by the French; though neither of them
occurs before the time of Edward II.

Some will have bannerets to have originally been per-
sons who had some portion of a barony assigned them; and
enjoyed it under the title of baro proximus, and that with the
same prerogatives as the baron himself.

Some again find the origin of bannerets in France;
others in Britain; others in England. These last at-
tribute the institution of bannerets to Coman, lieutenant of
Maximus, who commanded the Roman legions in England
under the empire of Gratian, in 383. This general, say
they, revolted, divided England into forty cantons, and in
these cantons distributed forty knights, to whom he gave a
power of assembling, on occasion, under their several banners,
as many of the effective men as were found in their respective
districts: whence they are called bannerets.

However this be, it appears from Froissart, &c., that an-
ciently each of the military men as were rich enough to raise
and subdue a company of armed men, and had a right to
enjoy the privilege appertaining thereto, were called bannerets.
Not, however, that these qualifications rendered them knights, but only bannerets; the appellee
of knighthood being only added thereto, because they were
simple knights before.

At the ceremony of creation, the king, at the head of his
force, after a victory, is surrounded by all the field officers
and nobles at court, under the royal standard displayed to receive
the intended knight banneret, who is led to the soverign
by two renowned knights or valiant men at arms, having his
penon or guidon of arms in his hand, preceded by the heralds,
who proclaim his valiant achievements. The king then fays
to him, “Advance thy banneret, and commands the ends
of his penon or guidon to be torn off, which then becomes a
banner, being square (on which he has his arms and support-
ers embroidered). The new knight banneret then returns
to his tent, accompanied by martial music, and attended
by many nobles and field officers, where he is highly en-
tertained. A knight banneret has a right to display his
banner in the field. Neither the title nor supporters are
hereditary. In the 28th of Edward I. the daily pay of a
knight banneret was four shillings and their diet at court;
they take precedence of the younger sons of viscounts and
barons. The last knight banneret was Sir John Smith, by
Charles I. after the battle of Edge-hill, where he refused the
royal standard from the rebels.

Banneret is also the name of an officer, or magistrate of
Rome, towards the close of the fourteenth century.

The people of that city and throughout the territory of
the church, during the disputes of the antipopes, had formed
a kind of republican government; where the whole power
was lodged in the hands of a magistrate, called senator, and
twelve heads of quarters, called bannerets, by reason of the
banners which each raised in his district.

Banneret-rolls, in Heraldry, are small flags used at
funerals.
BAN

BANNIMUS, q. d. *see banis*, from the obsolete *bannis*, the form of expulsion of any member from the university of Oxford, by affixing the sentence up in some public place, as a denunciation or proclamation of it.

BANNOCK, in *Psalms*, is an oat-cake, hallowed only with water, and baked in the embers. These cakes are common in Iceland and some other countries.

BANNOCKBURN, in *Geography*, a village of Scotland, in the county of Stirling, where was fought a battle between the English and Scots on the 25th of June 1314, in which the English were defeated with great loss, and by which the independence of Scotland was secured, and Bruce on the throne of the kingdom; and where James III., king of Scotland, was in 1487 overpowered by his subjects, wounded, and soon after murdered by a priest taking his confession; two miles south of Stirling.

BANNOW, the name of a town which formerly existed in the county of Wexford, province of Leinster, Ireland, situated at the south-eastern extremity of a small haven of the same name, formerly called Bagganban. This is noted as the place at which Robert Howlett, and now the privy of Mountmarae, and Maurice of Pembrough, (not Earl Strongbow, as some accounts erroneously state), the first of the English adventurers, landed in A.D. 1170. It is said by Geraldus Cambrensis, to be a little creek lying in the county of Wexford, near to Feathard a fishing town, the open sea lying on the eazz, and not far from the haven the mouth of Waterford on the south. The same writer speaks of it as very unfit for a harbour, and says that it derived its name from that of one of the ships in which the Englishmen arrived. The name Bagganban is retained in an ancient rhyme: "At the creek of Bagganban, Ireland was lost and won."

And the place was so noted, that some old writers have even spoken of the whole island by the name of Bannow. Though the town seems never to have arrived at the fame consequence that its neighbour Feathard did, it was made a borough and continued to fend members until the union. "So late as the year 1626," says the writer of a letter to Dr. W. Hamilton, "Bannow is regimented in the common-houfe books of Wexford, as having four streets, which paid quit-rent to the crown, and some buildings surrounding the church." The name of one of these streets, Weavers' street, indicates some manufacture to have been carried on. "The only remains of it," continues the latter writer, "which stand visible at this day (1786) are the walls of its church. There is not in or near the site of the former town even one solitary hut. The election for the representatives of the town is held on the walls of an old chimney, adjoining to the church, which tumbled down piece-meal, and forms the council table of that ancient and loyal corporation. Towns like as men; the vestiges of Bannow are traced with difficulty amid heaps of barren land, on privileges which interred dome in its continuance having ceased, in a few years it may be entirely forgotten. Its distance south from Dublin is 761 Irish miles, long. 6° 50'. W. lat. 52° 12'. N. Hollinghead. Transact. of Royal Irish Academy.

BANNOCUM Capitis, was a mulct paid in cattle.

BANNUS, or Banus, a title anciently given to the governor or vicerooy of Croatia, Dalmatia, and Schauonia.

BANNUS Episcopalis, was a mulct paid to the bishop by theft guilty of sacrilege, or other crimes.

BANON, in *Geography*, a town of France, in the department of the Lower Alps, and chief place of a canton in the district of Pans-. The place contains 935 and the canton 4743 inhabitants; the territory includes 330 kilometres and 11 communes.

BANONSEUR, a town of France in the department of the Meuse, and chief place of a canton in the district of St. Mihiel, 14 leagues north of St. Mihiel.

BANOV, in *Ornithology*, the name given by the people of the Philippine islands, to a kind of hawk, somewhat larger than our sparrow-hawk, and of a yellowish colour on the back and wings, and white under the belly. It is the most common of all the kinds of hawk in that part of the world, and is a very voracious animal.

BANQUET, in *Manus*, denotes that small part of the branch of a bird under the eye, which, being rounded like a small rod, gathers and joins the extremities of the bit to the branch, in such a manner, that the banquet is not seen, but covered by the cap, or that part of the bit next the branch.

BANQUET-LINE, is an imaginary line drawn by the hatters along the banquet, in forging a bit, and prolonged upwards and downwards, to adjut the designed force or weight of the branch, in order to make it stiff or easy; for the branch will be hard and strong if the fevil-hole be on the outside of the banquet, with respect to the neck; and it will be weak and easy, if the fevil-hole be on the inside of the line, taking the centre from the neck.

BANQUETING-ROOM, or house. (See Xenia, Saloon, &c.) The ancient Romans lapped in the atrium of their houses: but, in after-times, magnificent saloons or banqueting-rooms were built for the more commodious and splendid entertainments of their guests. Lucullus had several of these, each distinguished by the name of some god; and there was a particular rate of expence appropriated to each. Phutarch relates (in Lucullum, apud Oper. t. i. p. 519.) with what magnificence he entertained Cicero and Pompy, who went with designs to surprize him, by only telling a slave who waited that the cloth should be laid in the Apollo. The emperor Claudius, among others, had a splendid banqueting-room, named Mercury. But every thing of this kind was outdone by the lube of that celebrated banqueting-house of Nero, called domus aurus, which by the circular motion of its partitions and ceilings, imitated the revolution of the heavens, and represented the different feasons of the year, which changed at every service, and flowered down flowers, fencies, and perfumes on the guests. Heligobals, nevertheless, is said to have improved as much upon Nero, as the latter had done on Lucullus. Senec. Ep. 90.

BANQUETTE, in *Fortification*, is a little foot-bank, or an elevation of earth forming a path which runs along the inside of a parapet; by which the musquetiers get up to discover the counterfeeps, or to fire on the enemies in the moat or in the covert-way.

The banquet is generally between two and three feet high, and as wide, and four feet and a half lower than the parapet, having two or three steps to mount it by. Where the parapet is very high, they make a double banquet one over the other. See Baserwork.

BANSTEAD, in *Geography*, a village of Surry in England, is celebrated for its pittance downs, and the delicate mutton they produce. The sheep bred here are of a small species, and being fed mostly on the short festrated herbage which abounds with wild thyme, juniper, &c. their flees is peculiarly rich, and is often sold in the London markets for lamb. (See Shee.) The foil of these downs consists of chalk, flints, and a thin stratum of blackish mould. Here is an annual horse-race, much frequented by the sporting people of London.

BANSTICKLE, in Ichthyology, a name synonymous with 4 E.
with prickel-bag, prickel-back, and flockel-back. See Gasterotis.

BANSWALEH, in Geographical, a district of Hindoostan, situated on the west part of Malwa.

BANSWARA, a town of Hindoostan, in the country of Telingana or Golconda, twenty miles from Indelovoy.

BANSWARAH, a town of Hindoostan, in the country of Malwa, 75 miles west of Oogein, and 105 E. N. E. of Amedabad. N. lat. 25° 25'. E. long. 74° 25'.

BANTAM, a sea-port town in the north-west part of the island of Java, and capital of a kingdom. It is situated at the bottom of the bay of the same name, about a quarter of an hour's walk from the sea-side; and lies between two branches of a river that descends from the mountains, in an extensive plain, behind which there is a range of high and rocky hills extending far to the southward. Its distance from Batavia is about 13 Dutch miles, each of which is about 31 English miles. The communication between these places by land is very difficult, and almost impracticable, on account of the thick forests and deep marshes which lie between them; whereas the passage by water, with the advantage of the land and sea-winds, in the light Indian vessels or proas, called flyers, is performed in four hours. The town of Bantam is large, but has no walls or fortifications towards the sea, nor any on the land side, except fort Diamond, in which the king's palace stands. Bantam resembles a grove of cocoa-nut trees rather than a city. The housetops are mere huts, walled up with reeds or canes, plastered with clay, and covered with thatch or leaves of palm-trees, and are confusely disordered, without any arrangement of streets; and round each of them is a plantation of cocoa-nut trees, the whole being surrounded by a paling of split bamboo, by which every family is wholly separated from its neighbours. The river of Bantam, at its mouth, is about 170 or 180 feet wide, and is very shallow. However, at high water and in spring tides, it is from five to seven feet deep. Above the town it divides into three channels, of which that just mentioned is the middle one; the other two branches run into the sea, about the distance of 14 leagues on each side.

The gulph or bay of Bantam, bounded by a point of the same name and that of Peatang, forms a commodious retreat for ships, where a great number may anchor in safety. Within this bay are several small islands which are all uninhabited, except Pulo-Panjang, or the Long island, which is the largest and in which some fishermen reside. Five are plentiful; and the inhabitants prefer one called the kaalkop or bald-head, which has some resemblance to our cod. This bay was formerly famous for being the principal rendezvous of the shipping from Europe in the east. Bantam was the great mart for pepper and other spices, from whence they were distributed to other parts of the world. The chief factory of the English as well as Dutch East India company was settled there. The merchants of Arabia and Hindostan were not allowed to it. Its sovereigns were so dexterous in encouraging trade, by giving subsidies to foreign merchants against the violent and revengeful disposition of the natives, that the crime of murder was never pardoned when committed against a stranger, but might be committed by a foreigner for a fine to the relations of the deceased. This place flourished for a considerable time; but the Dutch having conquered the neighbouring province of Jacatra, where they have since built Batavia, and transferred their principal business to it; and the English having removed to Hindoostan and China, Bantam was reduced to a poor remnant of its former opulence and importance. Other circumstances have also accelerated its decline. The bay is so shoaled up with daily accretions of new earth washed down from the mountains, as well as by coral shoals extending a considerable way to the east, that it is inaccessible at present to vessels of burden. A fire also destroyed most of the houses; and few have been since rebuilt. With the trade of Bantam the power of its foreign declined. In his wars with other kings of Java, he called in the assistance of the Dutch; and from that period he became, in fact, their captive. He resides in a palace, built in an European style, within a fort called the Diamond, situated in a large open field, denominating the Palacebaan, where three roads, leading from different quarters of the town, unite to the westward of the river, and garnished by a detachment from Batavia; the commander of which takes his orders, not from the king of Bantam, but from a Dutch governor, who lives in another fort, called Speywyk, adjoining to the town, on the east side of the river, and nearer to the sea side. The royal palace is an oblong square, 800 feet long, and nearly half as broad; it has regular balustrades at the four corners, and several semi-circular pieces of arms on the sides. Stavoriaus counted 60 pieces of cannon, most of them being brass, and heavy artillery, but old, and few of them fit for service. The Dutch garrison consists of a captain, three subalterns, 150 privates who guard the king's person, and keep him always in the company's power. None of his subjects, nor even his sons, are allowed to approach him without the knowledge of the captain of the Dutch military, who keeps up a regular intercourse with the commandant at fort Speywyk. No Javanese or Bantammer is ever allowed to pass the night within the walls of the fort. The approach to it is by a drawbridge, thrown over the moat; and at the gate of the fort an officer and 24 men mount guard night and day. The walls of the king's seraglio are raised higher than those of the fort, to guard it against the inspection of the curious. When the king's sons arrive at the age of puberty they are removed from their father, but have each their separate seraglio or harem. All the servants of the place are women, and even the king's attendant guards are females. However, when he appears in public, he is accompanied by his Bantam life-guards, though they are never admitted within the gates of the fortresses, who besides their side-arms, which are crisses or long daggers, are provided with pikes, having very long and broad iron heads; and when the king goes abroad he is likewise attended by a guard of Europeans from the garrison. Besides maintaining a body of native troops, his Bantamees majesty is allowed to keep several small armed vessels, by means of which he maintains authority over some parts of the south of Sumatra. His subjects are obliged to fell him all the pepper they raise in either island at a low price, which he has contracted to deliver to the Dutch at a small advance, and much under the marketable value of that commodity. The religion of the kingdom of Bantam is the same with that which prevails in the island of Java, or Mecometan; and the present king joins the spirituall to the temporal power, and is high-priest of this religion; with which, indeed, he blends some of the rights and ceremonies of the chief Hindu gods of Java; adoring, for instance, the great banyan or Indian fig-tree, which is likewise held sacred in Hindoostan, and under which religious rites may be conveniently performed; in the same manner as all affairs of state are actually transacted by the Bantamees, under some shady tree by moonlight.

In the middle of the plain, or Palacebaan already mentioned, is a large wings or tree, or castaneous equistifolia, which, by its spreading branches, affords an agreeable shade; and at the foot of it a grave, covered with a large blue stone, in which was buried one of the former kings of Bantam. This is regarded by the inhabitants as a very holy place, and held in great veneration. Near this is a building which is used as a place of circumcication for the children
BANTAM.

Children of the king; and on such occasions, it is hung round and richly decorated with costly tapestry and pieces of cloth. The Paisehman is likewise the scene of horse-races and similar exercises, in which the courtiers appear on horseback, magnificently appareled, to contend with the king or his sons; but they always take care to yield the palm of victory to their royal competitors. The large square temple stands at the end of a plain; it is of a square form, with five roofs above one another, decreasing in size and at last terminating in a point, and surrounded by a wall. The spires, like the minarets in Turkey, to announce the hours of prayer. Neither Christian nor Pagan may enter this temple upon pain of death.

The chief authority at Bantam, on behalf of the company, is vested in a few merchant, with the title of commandant, who manages the trade, confining chiefly in pepper and some cotton yarn. To the commandant of Bantam belong the two residences or factories which the Dutch company polices in the southern part of the island of Sumatra; whence they derive annually a considerable quantity of pepper. At Bantam all heavy goods are weighed by bharis, each containing three picunds, and these bills are estimated at 15 lb. Stavrinus and some of his companions were admitted to an audience by the Bantam king. His dress consisted of a long Moorish coat, made of stuff interwoven with gold, and manufactured at Surat, called foeces, which hung down almost to his feet, and the sleeves of which were fastened by a row of small gold buttons. Under this coat, he wore a white shirt, and a pair of drawers reaching down to his heels, of the same stuff as the coat. His head was covered with a round and somewhat sharp-pointed cap, of a violet colour, laced with silver. Behind his chair stood one of his female life-guards, armed with a large gold kris, in a sheath of mally gold, which she held in an elevated position: two female slaves were seated on each side of him on the ground; one held his tobacco-box and his hetel-box, both of which were of gold, and when he wanted either, it was handed to him, wrapped in a silk-handkerchief, the other presented a golden-fringed pot to his majesty, whenever he had occasion for it. Pipes and tobacco were presented to the guests, as soon as they were seated, and the table was furnished with all kinds of Indian foods variously prepared. One favourite practice is mentioned, which was that of the king's frequently beholding during his meal, and it was followed by all the company. This custom, which is an etiquette of the court of Bantam, was designed to shew that each person's appetite was good and the food agreeable, which was pleasing to the king. Bantam is situated in lat. 6° 20'. E. long. 105° 24'. Stavrinus's Voyages, vol. i. p. 57—89. Stavrinus's Embassy to China, vol. i. p. 296—329.

Bantam-Cock, in Ornithology, a variety of the Phasianus Gallus, or the gallus pullus, tibis pennatis, pennis pollibus elongatis, in the Linnean sytem. It much resembles, says Buffon, the rough-footed cock of France. Its feet are covered with feathers, but only on the outside; the plumage of the legs is very long, and forms a sort of boots which reach a considerable way beyond the claws. It is courageous, and resolutely fights with one stronger than itself. Its iris is red; and it is said, that most of this breed have no tuft.

Bantam-Work, a kind of Indian painting and carving on wood, resembling Japan work, only more gay, and decorated with a great variety of gaudy colours. Bantam-work is of less value among connoisseurs, though sometimes preferred by the unskillful, to the true Japan work. Formerly it was in greater use and esteem than at present; and the imitation of it much practised by our japanners.

There are two sorts of Bantam as well as of Japan work; as, in the latter, some are flat, lying even with the back, and others high, or embossed, as in Bantam-work, some are flat and others in-cut, or carved into the wood, as we find in many large screens; with this difference, that the Japan artists work chiefly in gold and other metals, and the Bantam generally in colours, with a small sprinkling of gold here and there.

As to the flat Bantam-work, it is done in colours, mixed with gum-water, proper for the thing designed to be imitated. The method of performing the carved or in-cut kind is thus described by an ingenious artist. The wood is first to be primed with whitening and size; so often till the primer lie near a quarter of an inch thick; then it is to be water-plained, i.e. rubbed with a fine wet cloth, and some time after, brushed very smooth, the blacks laid on, varnished up with a good body, and polished well, though with a gentle hand. This done, the design is to be traced out with vermilion and gum-water, exactly in the manner the wood is intended to be cut; the figures, trees, buildings, &c. in their due proportions. Then the graver is applied, with other tools of proper flanges, differing according to the workman's fancy. With these he cuts deep or shallow, as is found convenient, but never deeper than the whitening lies; the wood being never to feel the edge of the instrument. Lines or parts of the black are filled to be left, for the draperies and other out-lights, and for the diffusion of one thing from another; the rule being to cut where the white is, and leave the black untouched. The carving being finished, they use the pencil, with which the colours are laid into the cut-work. After this, the gold is to be laid into those places which the design requires; for which purpose, a strong thick gum-arabic water is taken, and laid with a pencil on the work; and, while this remains wet, leaf-gold is cut with a sharp smooth-edged knife, in little pieces, shaped to the figures and figure of the places where they are to be laid. These being taken up with a little cotton, they dab them with the same close to the gum-water, which affords a rich luster. The work thus finished, they clear up the black with oil, taking care not to touch the colours. The European workmen, in lieu of leaf-gold, ordinarily use brass-dull, which is less bright and beautiful. Park, Treat. of Japan.

BANTAYAN, in Geography, a small island of the East Indies, belonging to the group of Philippines, situate north-east of Zebu, near cape Buraleque. It is encompassed by four or five of a smaller size; and the inhabitants employ themselves in fishing and making cotton hose.

BANTEIA, or BANTIA, in Ancient Geography, a town of Italy, in Apulia. Plutarch, in his life of Marcellus, speaks of this place in his account of the march of this general against Hannibal; and Horace (Od. iv. lib. 3) calls the defiles in its vicinity "faltae Bantii." BANTON, in Geography, a town of Germany, in the circle of Lower Saxony, and principality of Calenberg, in which is a carpet manufacture.

BANTI, BRIGIDA, in Biography, a sooperfinger of the first class. In 1777, she was engaged by the proprietors of the pantheon, to supply the place of the Agurati; a measure adopted merely on speculation, upon hearing from Paris of the effects of her fine voice in that capital.

She was the daughter of a gondoliere at Venice, and for some time a piazza performer in that city. After this exercise of her natural vocal powers, she flung her way to Lyons, where she performed in coffee-houses for such small donations.

BANZA, in Geography, a town of Africa, in the kingdom of Congo, now called St. Salvador.

BANZKOW, a town of Germany, in the circle of Lower Saxony, and county of Schwedien.

BAOBAB, in Natural History, the name of an African fruit, described by Prosper Alpinus. It is of the size of a lemon, but it resembles a gourd, and contains several black seeds, whose extremities are a little crooked. Its substance also much resembles that of the gourd; and, when first pulped off, is moist, red, and of a grateful acid taste. The people of Ethiopia, where it is plentiful, are very fond of it, in the scorched heats of summer; and the richer sort add sugar to it, to correct its acidity. It is a great cooler, and very agreeably quenches thirst; and has also some medicinal use, as it is good in contagious and pelllicate fevers. The people of Cairo, where the fresh fruit is not to be had, use its pulp dried and powdered; and it is so used at Senegal in pellicate fevers, the dysterny, and bloody flux. The juice is a drachm, taken either in common water, or in an infusion of the plantain.

The baobab tree, the *Adansonia digitata* (see *Adansonia*), has been very minutely and accurately described by Mr. Adanson, in the Memoirs of the Academy of Sciences at Paris. It is found at Senegal in Africa; and its bulk is so enormous, that it has more the appearance of a forest than of a single tree. Its trunk, which seldom exceeds twelve feet in height, measures between seventy and eighty feet in circumference, and is crowned with a number of branches, remarkable for their thickness and their length, which is from fifty to eighty feet. They mostly shoot out in an horizontal direction, and give to the trunk the appearance of an hemisphere from sixty to seventy feet high, and about a hundred and forty feet in diameter. The bark is an inch thick, of an ash-coloured grey, greasy to the touch, bright, and very smooth; the outside is covered with a varnish, and the inside is green speckled with red; the wood is white and soft; the leaves are oval, pointed at the end, and about five inches long, and two and a half broad; seven of these are generally attached to one pedicle. The tree produces flowers much larger than any hitherto known; the calyx of the flower consists only of one piece, the lower part of which forms a short tube, which spreads into the shape of a fan, having its edge divided into five equal parts of a triangular figure. The petals are five in number, of the same length with the calyx. From the same centre, and within the petal, rises a cone, which spreads into about one hundred filaments, each having a small frill in form of a kidney at the end of it, the convex part of which opens into two cells, which shed a dust, confining of small white transparent particles. The pistil rises from the centre of the calyx, and consists of an ovary, a style, and several stigmata, in number from ten to fourteen. The ovary becomes a very considerable fruit. The tree flowers in July, and the fruit ripens in October and November. The bark and leaves are dried, and powdered by the negroes of Senegal, and used like pepper and salt. Mr. Adanson used it as a preservative from the epidemic fever of the country, and found it of great benefit in promoting perspiration, and attenuating the excessive heat of the blood. The woody bark of the fruit, and the fruit itself, supply the negroes with an excellent soap, which they prepare by drawing a key from the afhes, and boiling it with palm-oil that begins to be rancid. The decaying trunks are hollowed out into burning-places for perfumes most esteemed by the negroes; such as poöts, medicines, and perfumes; and their bodies that are used in these trunks become perfectly dry, without rotting, and form a kind of mummies, without the help of embalment. This is the largest tree in Abyssinia. The wild bees perforate the trunk, which is soft and spongy, and lodge their honey in the holes made in it; and this honey is preferred to any other in Abyssinia. It may be propagated by seeds, procured from the country where it naturally grows. These must be sown in pots and plunged in a hot-bed; and when in about six weeks the plants come up, they should be transplanted into separate pots, filled with light sandy earth, and plunged into a fresh hot-bed, fiding them till they have taken new root: after which they should have free air in warm weather, and be sparingly watered. As the plants advance in growth, they must be shifted into larger pots, and kept constantly plunged in the bark-bed, and remain in the flove with other tender exotic plants. In three years, many of them rise to the height of six feet, and cut out several lateral branches, and their stems are proportionable; but after four or five years' growth, they are almost at a stand, their annual shoots rarely exceeding two or three inches. Some seeds obtained from Mr. Adanson have succeeded here, and many of the plants grow upwards of twelve or fifteen feet high. Martyn's Miller. The African baobab has been sometimes confounded with the American casaba.

BAOL, or BAUL, in Geography, a kingdom of Africa, in the country of Senegal, about eighty leagues long and twenty-four wide.

BAOOM, or Aroom, one of the newly discovered islands in the Southern Pacific ocean. S. lat. 10° 26'. W. long. 185° 17'.

BAUNS, Lës, a town of France, in the department of the Lower Seine, 24 leagues north of Candebee.

BAPEAUME, a town of France, in the department of the Garms of Cabis, and chief place of a canton in the district of Arras; three polls south of Arras, and 19 1/4 north of Paris. The place contains 3145, and the canton 12,950 inhabitants; the territory includes 147 1/4 kilometres and 23 commons.

BAPHE, in the Writings of the Ancients, a word used to express that fine red colour, with which they used to illuminate the capital letters in manuscripts, at the beginning of chapters. It is also called, by some, *encaujium* or *einaia*; and, by others, cocca and *cinnabar*. It was a very elegant colour, and is said to have been prepared of the purple colour taken from the *mures*, and some other ingredients. It was called *encaujium* from its refmbling very much the fine bright red used in enamels.

BAPTACA, in Geography, a town of North America in the country of New Navrre, forty-five miles E.S.E. of Cape Grand.

BAPTE, in Antiquity, an effeminate voluptuous kind of priests at Athens, belonging to Cotys or Cotytto, the goddess of wantonness; thus called, from their blasted dippings and washings, by way of purification. It seems, they were to be made very clean and pure, that they might wallow and defile themselves with the left reserve; for their rites were performed in the night, and confin'd chiefly of lascivious dances.

Eupolis having composed a comedy to expose them, inti-

tled BAPTE; they threw him into the sea, to be revenged; and the fame fate is also said to have befallen Cratinus, another Athenian poet, who had written a comedy against the bapte, under the same title.

Others derive the denomination bapte, from the practice of dyeing and painting their bodies, especially their eyes, brows, and officiating at the service of the deity with the parade and demumis of women. Juvenal describes them in this light. Sat. ii. ver. 91.

"Tales legentur orphant orgia tradit

Cecropia folits bapte hifare Cotytto."

BAPTE.
BAPTISM.

BAPTISM, in Natural History, a name given by the ancients to a sojilable fubstance used in medicine. They have left us but very short descriptions of it. Pliny only tells us that it was soft and of an agreeable smell. Hence Agricola judges, that it was probably one of the bitu- men.

BAPTISM, in Theology, formed from the Greek *πεν*., of *πενερω*., *dip* or *plunge*, a rite or ceremony by which persons are initiated into the profession of the Christian religion; or, it is the appointed mode by which a person assumes the profession of Christianity, or is admitted to a participation of the privileges belonging to the disciples of Christ. It was by this mode that those who believed the gospel were to be separated from unbelievers, and joined to the visible Christian Church; and the rite accompanying it, or washing with water, was probably intended to repre- sent the washing away, or removing the impurities of some former state, viz. the sins that had been committed, and the vicious habits that had been contracted, and to this purpose it may be observed, that the profession of repentance always accompanied it, or was understood to accompany, the profession of faith in Christ. That our Lord instituted such an ordinance as baptism, is plain from the commiission given to the apostles after his resurrection, and recorded in Matt. xxviii. 19, 20. To this rite, there is also an allusion in Mark, xvi. 16. John. iii. 5. Acts, ii. 1. viii. 12, 36-38. xxii. 16. The design of this institu- tion, which was to express faith in Christ on the part of those who are baptized, and to declare their resolution of openly profefl his religion, and cultivating real and uni- versal holiness, appears from Rom. vi. 3, 4. 1 Peter, iii. 21. Ephes. v. 26. and Tit. iii. 5. Some have inferred from Acts, ii. 38. xxix. 16. Tit. iii. 4-7; that God did thereby give to believers a token of the forgiveness of their sins, according to the terms of the gospel covenant; and they have alleged, that there is a foine in which baptism may be called a seal of the covenant of grace.

We find no account of baptism as a distinct religious rite, before the mission of John, the forerunner of Christ, who was called the "Baptist," on account of his being commanded by God to baptize with water all who should hearken to his invitation to repent. Washing, however, accompanied many of the Jewish rites, and, indeed, was required after contracting any kind of uncleanness. Also, soon after the time of our Saviour, we find it to have been the custom of the Jews solemnly to baptize, as well as to circumcise, all their profelytes. As their writers treat largely of the reasons for this rite, and give no hint of its being a novel institution, it is probable, that this had always been the custom antecedent to the time of Moises, whose account of the right of circumcision, and of the manner of performing it, is by no means circumstantial. Or, baptism, after circum- scribing, might have come into use gradually from the natural propriety of the thing, and its easy conformity to Jewish customs: For if no Jew could approach the tabernacle, or temple, after the well triefd uncleannesses, with- out lathering, much less would it be thought proper to admit a profelyte from a state of impurity and unclean as heathenism was conceived to be, without the same mode of purification. On the other hand, it has been alleged, that none of the washings which were practiced among the Jews, bear the least resemblance to Christian baptism, except in the single circumstance of dipping; and this circumstance is a mere accident, and may as well be taken from Pagan rituals, as from the ceremonies of the Jews; or, in other words, it is so vague and far-fetched, that it deserves, in this point of view, no consideration at all. Accordingly, it is maintained, there was no baptism in the world among any people till John, and that the purification of a profelyte by dipping himself, which is called baptism, was a late practice, long after the time of John. The antiquity of this practice of profelyte-baptism among the Jews, has been a subject of considerable debate. It has been strenuously maintained by Lightfoot (Works, vol. ii. p. 120, &c.), Emlyn (Previous Question in Tracks, vol. i. p. 594), Wall (History of Infant Baptism, Intro.), and controverted by Dr. Benjon (On St. Paul's Erift, vol. i. Dife. viii. p. ii.), Gale (Reflections on Wall), Robinson (Hist. of Baptism, p. 37) &c. Dr. Benjon was at first an advocate for the Jewish custom of initiating heathen profelytes by baptism; but upon further inquiry he relinquished this opinion alleging, that he had not found any influence of one person's washing another by way of confession, purification, or sanctification; except that of Moses' washing Aaron and his sons, when he set them apart to the office of priests, Lev. viii. 6.; and that he cannot find that the Jews do at present practice any such thing as that of baptizing the profelytes that come to them, though they are said to make them wash themselves. He then asks, where is any intimation of such a practice among the Jews, before the coming of our Lord? If any one, he says, could produce any clear testimony of this kind from the Old Testament, the Apocalypse, John, &c., it would be of great moment. He adds, in former times, profelytes coming over from Heathenism to the Jewish religion, used to wash themselves, which is a very different thing from baptism, or one person's being washed by another. The genuine Targums, say Gill and Gale, written about the close of the first century, and the Mischeha, written about the middle of the second century, say nothing on this subject. The Christian writers, called Fathers, speak of Jewish profelytes, and washings, and purifications from ceremonial uncleannesses; but nothing of admitting profelytes into the community by baptism. The baptism of profelytes, it is said, came to light through the later Rabbies, and is chiefly to be sought in the writings of Maimonides, who flourished in the eleventh or twelfth cen- tury. In the Old Testament there are many precedents of admitting profelytes into the Jewish church, as Rahab, Ruth, and others; but not one word is said of the thing being baptized. Among the laws of admission given by Moses, Exod. xii. 48, 49, this is not mentioned. Dr. John Owen (Theologoumena) considers the opinion, that Christian baptism came from the Jews, as definite of all probability. On the other hand, Mr. Wall has made it highly probable, to lay the lead, from many testimonies of the Jewish writers, who without one dissenting voice allow the fact, that the practice of Jewish baptism obtained before and as, well as after, our Saviour's time. There is also a strong intima- tion, even in the gospel itself, of such a known practice among the Jews in the time of John the Baptist. John i. 25. The testimonies of the Jewish writers are of the greater weight, because the practice, reported by them to have been of so ancient a date, did still remain among them; for if it had not been of that antiquity to which it pretends, viz. before the time of Christ, it is not likely that it would ever have become a custom among the Jews afterwards. Would they begin to profelyte persons in their religion by Baptism in imitation of the disciples of Jesus of Nazareth, whom they held accursed? And yet if this profelyte baptism were adopted by the Jews since the time of Christ, it must have been a mere innovation in imitation of Christians, which is not very likely. See on this subject Maimon. in Mishchn. tom. ii. Horeh. c. 1. and c. 13. Selden de Jure Naturali, &c. l. ii. c. 2. Altingius de Profelyitis, diff. 7. § 46. VIR-
BAPTISM.

Hence it would follow, that "to be baptized unto, or upon Christ," was a public solemn profession of faith in him. However the baptism of the Ethiopian minister by Philip, in a scene so private, and before he knew of indeed before any instance seems to be inconsistent with the notion that baptism was a solemn public profession of faith in Christ; and the requisition of a previous oral declaration of such faith totally overthrows it. See Cippe's Dissertation on Baptism, in Crit. Rem. vol. ii. p. 102.

Baptism is not to be repeated, since it is a right of initiation into Christ's church. However, these persons might be baptized in the name of Jesus, as the Mifians already came, who had before been baptized by John and his disciples into the general expectation of a Messiah shortly to be revealed. Compare Acts, xix. 5. The Christians in Abyflinia repeat their baptism annually, on the festival of Epiphany. The naming of the baptized person is by no means any part of this institution; and when it is used, it to be considered as an address to the person, calling him by his name, rather than as the manner of giving a name to him: though it is probable, that the custom of naming a child at baptism might arise from the practice of the Jews at their circumcision. Luke, i. 59.—63. ii. 21.

A triple immersion at an early period appeared, and continued for a long time; this was to signify either the three days that our Saviour lay in the grave, or the three persons in the Trinity. But it was afterwards hid aside, because the Arians used it; it was then thought proper to plunge but once. (See Immersion.) Some are of opinion that sprinkling in baptism was begun in cold countries. It was introduced into England about the beginning of the ninth century. At the council of Celerith, in 816, it was ordered, that the priest should not only sprinkle the holy water upon the head of the infant, but likewise plunge it in the basin. Some have referred the introduction of sprinkling in the church of Rome to a canon of pope Stephen III., who, during his residence in France, in 754, was confounded by some monks of Crefly in Brittany with regard to several questions; one of which is laid to have given occasion to the first authentic law for administering baptism by pouring, which in time was interpreted to signify sprinkling. The question proposed was, whether in case of necessity occasioned by illness of an infant, it were lawful to baptize by pouring water out of the hand or a cup on the head of the infant? To which Stephen replied; that if such a baptism were performed in such a case of necessity, in the name of the holy Trinity, it should be held valid. This, says the learned James Balnage (Monum. vol. i. pref. c. v. 1. 4. de Canone Steph. III. Papæ), is accounted the first law for sprinkling, but it doth not forbid dipping; allowing it only in case of imminent danger. He adds, that the authenticity of this is denied by some Catholics; that many laws were made after this time in Germany, France and England, to compel dipping, and without any provision for cases of necessity; and therefore this law did not alter the mode of dipping in public baptisms, and that it was not till 557 years after, that the legislature, in a concil at Ravenna, in the year 1211, declared dipping or sprinkling indigent. It has been alleged, that this answer of Stephen is the true origin of private baptism and of sprinkling. The introduction of sprinkling instead of dipping, in ordinary cases, into this island, is said to have been effected by such English, or more strictly speaking Scots exiles, as were disciples of Calvin at Gencui, during the Marian persecution; and it is added, that the Scots Calvinists, who first introduced sprinkling in ordinary baptism into the northern parts of the island, were the importers of it into the southern. In the reign
BAPTISM.

reign of king Edward, the established church practised in ordinary cases trice immersion; and pouring or sprinkling was allowed, only in cases of danger, in private. It is further argued by those who maintain that in the primitive church there is no mention of baptizing by pouring, that the administration of baptism by sprinkling was first invented in Africa in the third century, in favour of clinics, or bedridden people; but that even African Catholics, the least enlightened and the most deprived of all Catholics, derided it, and reputed it no baptism. See Jo. Andreus Bofii de Clinics exercit. Hill. Jena, cited by Robinson in his "History of Baptism," p. 449. In the liturgy of the English church at Frankfort, king Edward's service book was used, and baptism was administered by trine immersion. In the Scots church at Geneva, the minister was directed to take water in his hand, and lay it upon the child's forehead, which was called pouring. About 100 years after, in the assembly of divines, Dr. Lightfoot caused dipping to be excluded, and sprinkling declared sufficient. In the Eastern and Greek churches, dipping is said to have been the invariable mode of administering baptism from the first introduction of it to this day. See Dr. King's Rites of the Greek church.

There are many ceremonies delivered by ecclesiastical writers, as used in baptism, which were introduced after the age of Juffin Martyr, but which are now diffused; as the giving milk and honey to the baptized, in the East; wine and milk in the West. &c. They also addedunction and the imposition of hands. Tertullian is the first who mentions the signing with the sign of the cross, but only as used in private, and not in public worship; and he particularly describes the custom of baptizing without mentioning it. Indeed, it does not appear to have been used in baptism till the latter end of the fourth or fifth century; at which time great virtue was ascribed to it. Lactantius, who lived in the beginning of the fourth century, says (Inf. I. iv. c. 27. p. 439.), the devil cannot approach those who have the heavenly mark of the cross upon them, as an impregnable fortress to defend them; but he does not say it was used in baptism. After the council of Nice, Christians added to baptism the ceremonies of exorcism and adjurations, to make evil spirits depart from the persons to be baptized. They made several signings with the cross, they used to light candles, they gave oil to the baptized person to taste, and the priest touched his mouth and ears with spittle, and also blew and spat upon his face. At that time also baptized persons wore white garments till the Sunday following. They had also various other ceremonies; some of which are now abolished, though others of them remain in the church of Rome to this day.

The Quakers (see Quakers) assert, that water baptism was never intended to continue in the church of Christ any longer than while Jewish prejudices made such an external ceremony necessary; which they argue from that passage, in which one baptism is spoken of as necessary to Christians; Ephes. iv. 5. which, as they say, must be a baptism of the spirit. But from comparing the texts that relate to this institution, which have been already cited, it will plainly appear that water baptism was instigated by Christ in more general terms than will agree with this explication. That it was administered to all the Gentiles converted, and not confined to the Jews, appears from Matt. xxviii. 19, 20, compared with Acts, x. 47; and that the baptism of the spirit did not supercede water baptism, appears to have been the judgment of Peter and of those that were with him; so that the one baptism spoken of seems to have been that of water; the communication of the Holy Spirit being only called baptism in a figurative sense. As for any objection which could be drawn from 1 Cor. i. 17, it is sufficiently answered by the preceding verses, and all the numerous texts, in which, in epistles written long after this, the apostle speaks of all Christians as baptized; and argues from the obligation of baptism, in such a manner as we can never imagine he would have done, if he had apprehended it to have been the will of God that it should be discontinued in the church. Compare Rom. vi. 3. &c. Col. ii. 12. Gall. iii. 27.

Baptism was also wholly rejected by the Valentinians, Marcionites, Paulicians, and many other sects.

Several of the Socinians have maintained, that baptism was only to be used by those who are converted to Christianity from a different profession; and that though the children of such profelytes were to be baptized with their parents, all who descended from them were to be considered as baptized in them; and they urge the practice of profelyte baptism among the Jews in support of this opinion. (See Evelyn's Previous Question, ubi supra). However, it has been alleged in reply, that the antiquity of this practice of profelyte baptism among the Jews has been doubted, and even disallowed by many; and if it be admitted, all the rules and circumstances relating to it might not be known even to the apostles themselves; and it is also probable, that some of the rules of profelyte baptism did not prevail among them so early, particularly that which supposed that all natural relations were annulled by it. Besides, although it be acknowledged that no instance occurs in the earliest primitive antiquity, in which the baptism of any child of Christian parents, whether infant or adult, is expressly mentioned; yet it is certain that Christians in general have always been spoken of by the most ancient fathers as baptized persons; and the apostles, when writing to Christian churches planted many years before the date of their respective epistles, argue with the members of them from the obligation which their baptism brought upon them, in such a manner as would lead us to conclude, that they were baptized in their own persons; and it is also certain, that as far as our knowledge of primitive antiquity reaches, no unbaptized person received the Lord's supper, which, nevertheless, was an ordination none will deny that the descendants of Christians partook. It is added, that on this supposition, genealogies would be of great importance in religion, contrary to what St. Paul intimates; nor can it be reasonably thought that our right to Christian communion should rest on a fact, the evidence of which might sometimes be so obscure, as the baptism of some remote ancestor. See Gale's Sermon. vol. ii. N° 9. Benson on 2 Tim. p. 134–136. Whit. Life, vol. i. p. 367; 368.

Theological authors distinguish three kinds of baptism: 1. Water baptism, which is that above-mentioned. 2. Baptism of fire, which is the perfect love of God, joined with an earnest desire to be baptized; called also the baptism of the Holy Ghost: on occasion this may supply the place of water baptism. 3. Baptism of blood, which is the martyrdom of a catechumen.

Baptism, in the primitive times, was only administered at Easter and Whitsuntide, except in cases of necessity. Adult persons were prepared for baptism by abstinence, prayer, and other pious exercises. It was to answer for them, says Mothein (Eccl. Hist. vol. i. p. 211.), that sponsors, or godfathers, were first instituted in the second century; though they were afterwards admitted also in the baptism of infants. This, according to M. Daille, was not done till the fourth century. Wall (Hist, Inf. Bapt. vol. i. p. 49.) refers the origin of sponsors, or godfathers, on the
authority of Tertullian, to the commencement of the 3rd century; who were used in the baptism of infants that could not answer for themselves. (See Godfathers.) The catechumenus were not forward in coming to baptism; St. Ambrose was not baptized before he was elected bishop of Milan; and some of the fathers not till the time of their death. Some deferred it out of a tender confidence; and others out of too much attachment to the world; it being the prevailing opinion of the primitive times, that baptism, whenever conferred, washed away all antecedent stains and sins. Accordingly, they deferred this sanctifying rite as long as possible, even till they apprehended they were at the point of death. Caesars of this kind occur at the beginning of the third century. Confinant the Great was not baptized till he was at the last gasp, and in this he was followed by his son Confinantius; and two of his other sons, Confinantine and Conflans, were killed before they were baptized. Divers of the fathers rallied this superfluous delicacy to such a degree, that they introduced a different extreme; the ridiculous zeal of some people carrying them to baptize even the dead, by proxy. Eiphaphianus, Chryfofom, and Thodoret, observe, that this custom prevailed in some places in their time. See Balnage Hist. des Elyfes Reformés, vol. i. p. 137.

The opinion of the necessity of baptism in order to salvation, is grounded on these two sayings of our Saviour: "He that believeth, and is baptized, shall be saved;" and, "Except a man be born of water, and of the spirit, he cannot enter into the kingdom of God." Mark xvi. 16. John iii. 5. In the age immediately following that of the apostles, we find that baptism and regeneration were used as synonymous terms; and whereas, originally, the pardon of sin was supposed to be the consequence of that reformation of life which was only promised at baptism, it was now imagined that there was something in the rite itself, to which that grace was annexed; and in general it seems to have been imagined that this sanctifying virtue was in the water, and in no other part of the ordinance as administered by the priest. Tertullian says, that the Holy Spirit was always given in baptism; and he says, that the spirit of God depends upon the water of baptism like a dove. Caryfofom affirms, that the water ceases to be what it was before, and is not fit for drinking, but is proper for sanctifying; and that the Christian baptism is inferior to that of John, as his was the baptism of repentance, but not the power of forgiving sin. Augustus says, that it unites the body, and purifies the heart. Balsagne (ubi supra), p. 138. And it appears by a passage in Auffin, that the African Christians usually called baptism salvation, and the eucharist life, preferring the former to the latter. Wickliffe thought baptism to be necessary to salvation. "The priest," he says, "in baptism administers only the token or sign, but God, who is the priest and bishop of our souls, administers the spiritual grace." Gilpin’s Life of Wickl. p. 64. It is also the language of the public forms of the Church of England, that baptism is necessary to salvation, and that by baptism an infant is regenerated, becomes a child of God by adoption, and is incorporated into God’s holy church. Similar to this is the doctrine of the church of Scotland; for, in their confession of faith, baptism is said to be a sign or seal of the covenant of grace, of perfrons ingrafting into Christ, of regeneration, of remission of sins, &c. As to the necessity of baptism, we may observe, however, that, throughout the same seem to have laid too great stress upon it, as if it were indispensably necessary in order to salvation; it must be allowed, that for any person to omit baptism, when he acknowledges it to be an institution of Christ, and that it is the will of Christ that he should submit to it, is an act of disobedience to his authority, which is inconsistent with true faith. Mr. Dodwell maintains that the ordinance of baptism, if administered by persons duly ordained, conveys an immortalizing spirit; whereas persons dying unbaptized are not immortal. Mr. Hallett also (Notes on Script. vol. ii. p. 392—311.), though he does not affirm it in express terms, seems to intimate something very like it, when he says, that circumcision was that which gave the infant a right to immortality; and that baptism in this respect comes in the room of circumcision; and yet that no infants are miserable in a future state.

Some have maintained that the commissi6n to baptize was addressed by Jesus only to the apostles; and hence they argue that none but apostles and apothegmatic men, their successors, have any right to administer baptism. But it has been affed to others, is it a true fact that during the lives of the apostles, none but they baptized? Philip the deacon baptized the Samaritans (Acts xvii. 14—15); there was an apostle at Damascus when Paul was baptized, but he was baptized by a certain disciple named Ananias. Acts ix. 18. Rom. vi. 4. See also Acts xviii. 2, &c. Acts x. 5—23. It is also inquired further by persons of this latter class, who are the successors of the apostles? and whether or not Jesus instituted a priesthood or any order of men to succeed the apostles? It is, however, a fact which cannot be controverted, that in the earliest age of the Christian church, the bishop only, or the priests by his permission, administered baptism; as with his leave, they also performed any other of his functions; but it appears from Tertullian, that in his time laymen had in some cases the power of baptizing. This baptism, nevertheless, seemed to have required the confirmation of the bishop, and would not be allowed but in case of necessity, as at the approach of death, &c. At a synod at Elvira, in 306, it was allowed, that a layman, provided he had not been married a second time, might baptize catechumens in case of necessity; but it was ordered, that if they survived they should be brought to the bishop for the imposition of hands. Afterwards, when the bounds of the church were much enlarged, the business of baptism was left almost entirely to the priests, or the country bishops; and the bishops of great fees only confirmed afterwards. It seems, however, to be decent and proper, that baptism should be administered only by the teachers and ministers of the church, where their attendance can be had; not only because it appears that these were the persons by whom it was administered in the New Testament, but because, easteri parvis, they must be most capable of judging who are the fit subjects of it.

Great doubts were raised in early times about the validity of baptism as administered by heretics. Tertullian, before he became a Montanist, wrote a treatise to prove that heretics, not having the same God or the same Christ with the orthodox, their baptism was not valid. Cyprian called a synod at Carthage, in which it was determined, that no baptism was valid out of the Catholic church, and therefore, that those who had been heretics should be re-baptized. But Stephen, the bishop of Rome, did not approve of this decision; and by degrees his opinion, which continued to be that of the church of Rome, became prevalent everywhere. Indeed, when so much stress was laid upon baptism itself, it would have introduced endless anxiety, if much doubt had remained about the power of administering it. For a further account of the subjects and mode of baptism, see Baptists, and Pseudobaptists; see also Ana-

BAPTISM OF THE DEAD; a custom which originally prevailed.
valued among some people in Africa. The third council of Carthage speaks of it as a thing that ignorant Chriftians were fond of. Gregory Nazianzen also takes notice of the same superfluous opinion prevailing among some who delayed to be baptized. In his address to this kind of men, he asks, whether they paid to be baptized after death? Philoſtius also notes it as the general error of the Montanills or Cataphrygians, that they baptized men after death.

The practice seems to be grounded on a vain opinion, that when men had neglected to receive baptism in their life-time, some compensation might be made for this default by receiving it after death.

Baptism of the Dead was also a fort of vicarious baptism formerly in use, where a person dying without baptism, was baptized in his stead, a practice founded on 1 Cor. xvi. 29, concerning the sense of which passages critics have been much divided. Several Catholics understand it of the baptism of tears, penance, and prayers, which the living undergo for the dead, and allege it as a proof of the belief of purgatory in the apostles' days. See Heiniius's Exerc. ad Nov. Teft. lib. vii. cap. 13.

Michaelis understands, with Grotius and Simon, by βαπτισμὸς τῶν νεκρῶν, or baptism for the dead, a vicarious baptism for the dead. Whether this vicarious baptism was practiced in the first century, and meant by the apostles, it is difficult to pretend to determine; and Dr. Teller, one of the most able expounders of the New Testament, candidly confesses, that he is unable to comprehend the meaning of the passage. It is, however, certain that the custom was not unknown in the fourth century, as appears from Chrysostom's 4th homily to the first epiftle to the Corinthians; and in the same century it was not unusual to defer baptism till the approach of death, and if the patient died suddenly, to baptize even the deceased. Michaelis's Introd. by Marth, vol. i. p. 359.

Others have suppos'd that the superfluous custom of baptizing a living person as the representative of one who had died unbaptiz'd, is more likely to have arisen from an erroneous interpretation of this passage than to have been fo early prevalent. Some conceive that ἀνέβαστος is here put for ἀνεβάζω, and refers to those who were baptized into the religion of Jesus, who on the hypothesis of the adversaries against whom the apostle reasons, is ζημίως and dead. Sir Richard Ellys, in his "Fortitudo Sacri," p. 137, interprets these words in the following manner: "what should they do, who are baptized, in token of their embracing the Christian faith, in the room of the dead, who are just fallen in the cause of Christ, but are yet supported by a succession of new converts, who immediately offer themselves to fill up their place, as ranks of soldiers that advance to the combat in the room of their companions, who have just been slain in their fight." Doddr. in loc. Wackfield (Translation, vol. ii. p. 83) renders the words: "Becides, what advantage above the other dead will they have, who are submitting consequently to baptism? Why indeed are they thus baptized, if the dead will certainly live no more? Why should we too expose ourselves to the danger of it every hour?" The apostle, says this critic, here begins a new argument of the resurrection, grounded on the practice of the apostles themselves, who had been eye-witnesses of their master's revival. What contributed not a little to obscure this passage, he adds, was the second ἀνέβαστος ἀνεβάζω, a clause not acknowledged by the Coptic and Ethiopic versions. For this sense of baptism, the reader may consult Matt. xx. 22. Luke xii. 50. Eus. Eccl. Hist. vi. 4. in ; and for an illustration of the argument, Rev. xx. 4.

Baptism, Lay, seems to have been allowed in the rubric of the English liturgy, till the time of king James I, though there were great disputes among the bishops at the Hampton-court conference in 1603, whether the words of the liturgy imported such allowance or not. The bishop of Worcester allowed them to be doubtful; but that the contrary practice of the church, which cenured men for conferring baptism, shewed, that the compilers of the book did not intend them as a permission: they had indeed propounded them ambiguously, because otherwise perhaps, the book would not have passed the parliament. The archbishop of Canterbury intituled, that the administration of private baptism by women and laymen was not allowed in the practice of the church, but, on the contrary, cenured by the bishops in their visitations. He even added, that the words of the liturgy do not infer any such meaning. To which king James excepted; urging and pleading the words of the book, that they could not but intend a permission of women and private persons to baptize. Till this time it had been customary for bishops to license midwives to their office, and to allow their right to baptize in cafes of necessity, under an oath which was preferred to them. At present, the English divines condemn it as invalid; and Burnet, bishop of Sarum, was severely handled by some of them, for departing that faith in the Trinity gives every man a right to baptize. Collins's Diff. on Free-Think. p. 72.

Baptism, Clinic. See Clinic.

Baptism is also applied abusively to certain ceremonies used in giving names to many inanimate things.

Baptism, in Sea Languages, is a ceremony in long voyages aboard merchant-ships; practiced both on persons and vessels which pass the tropic, or equinoctial line, for the first time.

That of vessels is simple, and consists only in the washing them throughout with sea-water; that of passengers is ludicrous: but neither the one nor the other is done without making the crew drunk; the seamen on churring the ship, pretending, to a right of cutting off the beard, heads allowed by the master or captain.

Baptism of Ills. See Bell.

Baptismal Font. See Baptistry.

Baptismal Pations are in use in Germany, made by the pious to the infant, consisting of money, plate, or even sometimes sheets of land: which, by the laws of the country, are to be kept for the child till of age, the parents having only the trust, not the right of disposing of them.

An anonymous author has published a discourse express on this occasion, intitled, "De Pecunia Lutricia."

Baptismal Vow, or Covenant, a profession of obedience to the laws of Christ, which persons, in the ancient church, made before baptism.

It was made by turning to the East, but for what mystical reasons is not well agreed.

Baptist, John, Monoyer, in Biography, an eminent painter of flowers and fruit, was born at Lille in 1635, and educated at Antwerp. The composition and colouring of this master are in a bolder style than those of Van Huyten, but his pictures are not so exquisitely finished. The disposition of his objects is so elegant and beautiful as to form a test by which his compositions may be distinguished from those of other masters. He was invited to England by the dukes of Montagu, and employed in conjunction with La Fosse and Roufféau, to embellish Montague house, which is now the British Museum, and in which they are preferred some of the finest performances of Baptist. A very celebrated work of this artist is a looking-glass preserved in the royal palace at Kensington, decorated with a garland.
BAPTIST, JOHN, GASPAR, a painter of history and portrait, was born at Antwerp, and was a disciple of Thomas Willeborts Bofchaert. During the civil wars he came over to England; and after the restoration was employed by Sir Peter Lely, to paint the portraits and draperies of his portraits, and distinguished by the name of Lely's Baptif. He made designs for tapestry, which were accounted good, and his drawing was generally correct. In the hall of St. Bartholomew's hospital there is a portrait of king Charles II. painted by this master. He died in 1691. Pilkington.

BAPTISTRY, in Ecclesiastical Writers, a place or edifice where water is preferred for persons to be baptized in. Anciently in the churches which baptized by immersion, the baptistry was a kind of pool where the candidates were plunged; though in many places the next river served for a baptistry, which was the cænus in the time of Julius Martyr and of Tertullian.

About the middle of the third century, they began to build baptisteries; but there were none that approached to churches till the year 496, and then they flood without the church, and of this kind the first was prepared for the baptism of Clovis king of France, who, with his iñter Audofledis was dipped three times by immersion. But there were none within the churches till the sixth century; and it is remarkable, that though there were many churches in one city, yet, with few exceptions, there was but one baptistery. This simple circumstance became in time a title to dominion; and the congregation nearest the baptistry, and to whom in some places it belonged, and by whom it was lent to the other churches, pretended that all the others ought to consider themselves as dependent upon them. When the fashion of dedication was introduced, the church that owned the baptistery was generally dedicated to St. John the Baptist, and assumed the title of St. John in fonte, or St. John ad fontis, that is the church near or at the baptistery. The noble and splendid cities of Florence, Pisa, Bologna, Parma, Milan, and many others in Italy, had but one baptistery in each; and these baptismal churches were usually built near rivers and waters, as was the cænus with respect to those of Milan, Naples, Ravenna, Verona, and many more. In later times, the bishop of the baptismal church, having obtained feudal power granted licences for other churches to erect baptisteries; taking care at the same time to maintain his own dominion over the people.

By a baptistery, which must not be confounded with a modern font, is to be understood an octagon building, with a cupola roof, resembling the dome of a cathedral, adjacent to a church, but forming no part of it. The whole middle part of this edifice was one large hall capable of containing a great number of people; the sides were parted off, and divided into rooms; and in some, rooms were added on the outside in the fashion of cloisters. In the middle of the great hall was an octagon bath, which, strictly speaking, was the baptistery, and from which the whole building derived its appellation. Some of these were erected over natural rivulets; others were supplied by pipes, and the water was conveyed into one or more of the side-rooms. Some of the surrounding rooms were vellaries, others school-rooms, both for transacting the affairs of the church, and for the instruction of youth. They were kept by men as baptistery was administered only twice a year, the candidates were numerous, and the spectators more numerous than they. In process of time there were baptisteries at most of the principal churches of Rome, as at those of St. Peter, St. Lawrence, St. Agnes, St. Pancras, and others. The most ancient is that at St. John Lateran. Baptisteries were also erected separate from the churches in all the principal cities of Italy, as Florence, Ravenna, Milan, Pisa, Parma, and the rest. The baptistery annexed to the spacious and splendid church of St. Sophia at Constantinople, resembled the convocation room of a cathedral; it was very large; councilis have been held in it; and it was called μην των τυχερων, the great illuminatory. In the middle was the bath, in which baptism was administered; and there were outer rooms for all concerned in the baptism of immersion, the only baptism of the place. The Lateran baptistery at Rome, belonging to the church of St. John Lateran, is an octagon edifice, the roof of which is supported by eight large polygonal pillars of porphyry; and under the cupola, in the centre of the floor, is the baptistery properly so called, lined with marble, with three steps for descent into it, and about five Roman palms, or 37½ inches, deep. Ciampini apprehends, after much investigation of the opinions of antiquarians, that this baptistery was originally a bath in the precincts of the imperial palace; that it was begun to be converted into a baptistery by the emperor Constantine; that the buildings were carried on by pope Xystus III.; and that they were completed and ornamented by pope Hilary. Baptisteries were in fashion in Italy from the reign of Constantine to that of Charlemagne, during a period of about 500 years; and within this interval they were amply adorned and endowed. The first gifts of the faithful were milk, honey, and wine, for the refreshment of the candidates and their attendants; the next were oils, unguents, and salts; along with these came cups, vases, plates, and utensils, marked with the initial letters of the name of John Baptist, I. B. or John the fore-runner, ΙΩΑΝΠΙΩΝ, which perhaps is the true origin of baptismal inscriptions; then came money for the poor, and for the support of those who spent their time in teaching and officiating; after these came habits, ornaments, pictures of John holding out his right hand, with a lamb lying in it, being a reference to his words, "Behold the lamb of God;" and these were followed by others more complex; the whole forming a large body of superfluous theology, glaring in practice, but cumbersome to virtue.

In the baptism of infants, it was unnecessary for the administrators to go into the water, and therefore they used cibors, which they called fonts, in which the children were dipped. These were at first small baths, erected on a platform, into which those who performed the ceremony plunged children, without going into the water themselves. In modern practice, the font remains, but a bason of water set in the font serves the purpose, because it is not thought necessary either that the administrator should go into the water, or that the candidate should be immersed. This in England was customary, but not law; for in the time of queen Elizabeth, the governors of the episcopal church did in effect expressly prohibit sprinkling, by forbidding the use of fonts in public baptism. See "A booke of certain canons, concerning some part of the discipline of the church of England," in 1571, by John Daye, p. 19. Fonts in parish-churches for the purpose of baptizing infants were introduced soon after the arrival of Anlin the monk; and each parish was enjoined to provide fonts of wood and stone for this purpose. In the old church of St. Peter at Oxford, built by Grynwald, who was brought over from Flanders into England by Alfred, in the year 885, there was till lately a very ancient baptismal font, of a circular form, and elegant sculpture.
eleven feet in circumference, and of proportionable depth, with the twelve apses represented in separate niches. After having kept its place about 500 years, it was ordered to be removed, and another much inferior put in its place. In the church of Bridekirk, near Cockermouth in Cumberland, there is a large open vessel of greenish bone, which antiquaries pronounce to be a Danish font. The chief characters on this baptismal font (see Gibbon’s Camden’s Brit. vol. ii. p. 1007.) are Runic, but some are purely Saxon. This is supposed to be the oldest font yet remaining in this kingdom, being of the ninth century, when the Danes first received the Catholic religion. Whether the font be Danish or Saxon, the baptism which it exhibits is that of the Catholics opposed to that of the old Pelagian Britons.

There were several fonts and altars in each baptistery, because then they baptized at once, all of whom received the eucharist immediately after.

The right of having fonts was confined to parishes alone; and if any monasteries were found with baptismal fonts, it was because they had baptismal churches in another place; though the bishops sometimes granted them to monks, upon condition that they would have a secular priest along with them to take care of the people; but they afterwards found means to throw off the priest, and make themselves masters of the church, and attach it, with its baptismal fonts, to their own monastery. For a copious account of baptisteries and fonts, illustrated by figures, see Robinson’s History of Baptism, p. 56—131.

Baptistery is also used for a baptismal or parochial church.

Baptistery is also used by the Armenians, for the feast of Epiphany, when the anniversary of Christ’s baptism is celebrated.

Baptistery is also used for a church-book, wherein the prayers and ceremonies of baptism were particularly described. Some take the baptisterium to have contained the order of all the sacraments, except the eucharist.

BAPTISTS, in Ecclesiastical History, from Baptist, a denomination of Christians, distinguished from other Christians by their particular opinions respecting the mode and subjects of baptism.

Instead of administering the ordinance by sprinkling or pouring water, they maintain that it ought to be administered only by immersion. Such, they insist, is the meaning of the word βαπτιστής; so that a command to baptize is a command to immerse. Thus it was understood by those who first administered it. John the Baptist, and the apostles of Christ, administered it in Jordan and other rivers and places where there was much water. Both the administrators and the subjects are described as going down into, and coming up again out of the water. And the baptized are said to be buried in baptism, and to be raised again; which language could not, they say, be properly adopted on supposition of the ordinance’s being administered in any other manner than by immersion. Thus also, they affirm, it was in general administered in the primitive church. Thus it is now administered in the Russian and Greek church; and thus it is, at this day, directed to be administered in the church of England, to all who are thought capable of submitting to it in this manner. With regard to the subjects of baptism, the Baptists say, that this ordinance ought not to be administered to children or infants at all, nor to grown persons in general, but to adults only of a certain character and description. Our Saviour’s commission to his apostles, by which Christian baptism was instituted, is to go and teach all nations, baptizing them: that is, say they, not to baptize all they meet with; but to instruct them—to teach all nations, or to preach the gospel to every creature—and whoever receives it, him to baptize in the name of the Father, and of the Son, and of the Holy Ghost. To such persons, and to such only, baptism appears to have been administered by the apostles, and the immediate disciples of Christ. They are described as repeating of their sins, as believing in Christ, and as having gladly received the word. Without these qualifications, Christians in general think it wrong to admit persons to the Lord’s supper; and, for the same reasons, without these qualifications, at least a profession of them, the Baptists think it wrong to admit any to baptism. Wherefore they withhold it, not only from the impenitently vicious and profane, and from infidels who have no faith, but also from infants and children, who have no knowledge, and who are incapable of every action civil and religious. They farther insist, that all positive institutions depend entirely upon the will and declaration of the initiator; and that therefore reasoning by analogy from previous abolished rites is to be rejected, and the express commands of Christ respecting the mode and subjects of baptism ought to be our only rule.

The Baptists in England form one of the three denominations of Protestant dissenters. They separate from the establishment for the same reasons as their brethren of the other denominations do, with whom they are united; and from additional motives derived from their particular tenets respecting baptism. The constitution of their churches, and their modes of worship, are congregational or independent: in the exercises of which they are protected, in common with other dissenters, by the act of toleration. Before this act, they were liable to pains and penalties as non-conformists, and often for their peculiar sentiments as Baptists. A proclamation was issued out against them, and some of them were burnt in Smithfield in 1558. They bore a considerable share in the persecutions of the 17th and of the preceding centuries; and as it should seem, in those of some centuries before; for there were several among the Lollards and the followers of Wickliff, who disapproved of infant baptism. There were many of this persuasion among the Protestants and reformers abroad. In Holland, Germany, and the North, they went by the names of Anabaptists and Mennonites; and in Piedmont and the South, they were found among the Albigenses and Waldenses. See the Histories of the Reformation, and the above articles in this Dictionary.

The Baptists submit under two denominations, viz. the Particular or Calvinistical, and the General or Arminian. The former is by far the most numerous. Some of both denominations allow of mixed communion, others disallow it; and some of them observe the seventh day of the week as the sabbath, apprehending the law that enjoined it not to have been repealed by Christ or his apostles. But a difference of opinion respecting these and other matters is not peculiar to the Baptists; it is common to all Christians, and to all bodies of men who think and judge for themselves. See Pseudo-Baptists, under which article an account will be given of the principal arguments in favour of infant baptism.

BAR, in Architecture, a long slender piece of wood or iron, used to keep things close and fast together. In this sense, we speak of bars of windows, of doors, and the like.
B A R

Bars of iron are made of the metal of the fows and pigs as they come from the furnaces.

These bars through two forges called the finery and the chafury; where, undergoing five several heats, they are formed into bars. Phil. Trans. No. 138, p. 954. See Iron, and Forge.

Bar Shot, in Artillery. See Shot.

To bar or strike a vein, among Farriers, an operation performed on the veins of a horse's legs, or other parts of his body, in order to close the course, and lessen the quantity of malignant humours prevailing there.

It is thus performed: the farrier opens the skin, after disengaging the vein, ties it above and below, and then strikes between the two ligatures.

1 Bar of a Port, in Marine Fortification. See Boom.

Bar, in Geography, is used for a heap of sand or mud, or a chain of rocks, which block up the mouth of a river or port, so that there is no entrance except at high water.

The bar of Stel is a remarkable bank of mud, gathered in the mouth of the river, which allows not above thirteen feet of water, when the tide is highest.

Bar, a town of Arabia, fifty-six miles south-east of El Catif, near the Persian gulf.

Bar, a town of Hindoostan, in the country of Bahar, fifteen miles north of Bahar, and thirty E.S. of Patna.

Bar, Le, a town of France, in the department of the Var, and chief place of a canton in the district of Graffe, four miles north-east of Graffe; the place contains 1,143, and the canton 6,255 inhabitants; the territory includes 177,511 kilometres and 112 communes.

Bar for Aube, a town of France, and principal place of a district in the department of the Aube. The place contains 4,000, and the canton 13,701 inhabitants; the territory includes 257,513 kilometres and 23 communes. N. lat. 48° 1', E. long. 4° 36'.

Bar for Seine, a town of France, and principal place of a district in the department of the Aube, situated at the foot of a mountain, on the Seine; it has three gates, a college, and a hospital; 5 leagues S.E. of Troyes. The place contains 2,209, and the canton 11,142 inhabitants; the territory includes 257,513 kilometres and 23 communes. N. lat. 48° 17'. E. long. 4° 16'.

Bar le Duc, a town of France, and principal town of a district in the department of the Meuse; and, before the revolution, the capital of the duchy of Bar. It is divided into the Upper and Lower town by a castle called the Bar, and was of a kind of barrier between France and Lorraine. The walls and towers of this castle were demolished by Louis XIV. The river Orne runs through the lower part of the town. It is seven leagues S.E. of St. Menehould, and 93 miles of Toul. The place contains 9,900, and the canton 14,217 inhabitants; the territory includes 77,511 kilometres and 8 communes. N. lat. 48° 47'. E. long. 4° 4'.

Bar, Duchy of, was, before the revolution, the name of a country of France, situated to the west of Lorraine, thirty-two leagues long and sixteen wide; the face of the country is irregular, presenting hills and plains; and it abounds with wood, wine, corn, game, and fish. Its name was derived from the castle of Bar, and it was erected into a county by the emperor Otho, but the time when it was raised to a duchy is not ascertained.

Bar, a district of Switzerland, in the canton of Zoug. See Zuc.

Bar, is also the name of a fortres of Poland, in Podolia. Bar, in Heraldry, denotes an ordinary nearly resembling the Phe: it consists of two lines drawn horizontally across the field, and contains a fifth part thereof. The Bar hath two diminitives: viz. a clofet, which is in breadth one-half; and a barulet, which is in breadth one-fourth of that of the bar. When the field is divided into four, five, eight, ten, twelve, or more equal parts, it is then blazoned, barry; and the number of pieces are to be specified, e. g. barry of eight pieces, but if it contains an odd number, the field must be first named, and the number of bars expressed; they are then called bars. See Plate of Heraldry.

Bars Gemel, or Bars-Gemelli, are diminutives of the bar, and are placed in pairs, or two and two on a shield. They derive their name from the Latin gemelli, twins. See Plate of Heraldry.

Bar, in a Court of Justice, denotes an inclosure made with a strong partition of timber, three or four feet high, where the counsel are placed to plead causes; and where prisoners are brought to answer their indictments, &c.

This the French call barre d'audience and in some places auditoire. It answers to what, among the Romans, was denominated canodia.

It is called bar, because included with a barrier, called also in Latin writers cancelli and caules, by a metaphor taken from deep-folds.

The denomination bar is also given to the benches where the lawyers or advocates are seated—The appellation arose hence, that anciently there was a bar, or barrier, to separate the counsellors and pleaders from the attorneys and others.

Hence our lawyers who are called to the bar, or licenced to plead, in other countries called licentiati, are termed barristers. 24 Hen. VIII. c. 24.

Bar, of Barr, Barra, in Common Law, denotes a peremptory exception against a demand or plaint.

The author of the "Tiusms de Ley" defines bar, a plea brought by the defendant in an action, whereby the action of the plaintiff is destroyed for ever. And it is divided into bar to common intendement, and bar special; the former is an ordinary or general bar, which is initially a bar to the declaration of the plaintiff; and the latter is that which occurs upon some special circumstance of the fact, as to the cafe in hand. Modern writers also divide bars into perpetual and temporary: bar perpetual, is that which overthroweth the action for ever, and bar temporary, or bar pro tempore, is that which is allowed good for the present, but may fail, or be set aside hereafter. Plowd. 26. A plea in bar not giving a full answer to all the matter contained in the plaintiff's declaration, is not good. 1 Litt. Abr. 211. If one be barred by plea to the writ, or to the action of the writ, he may have the same writ again, or his right action again: but if the plea in bar be to the action itself, and the plaintiff be barred by judgment, &c. it is a bar for ever in personal actions. 6 Rep. 7. And a recovery in debt is a good bar to action on the cafe, for the same thing; also a recovery on affimpt in cafe is a good bar in debt, 8th, 97. 7. 10 Rep. 94. In all actions personal, as debt, account, &c. a bar is perpetual, and in such cases the party hath no remedy but by writ of error or attainder; but if a man is barred in a real action or judgment, yet he may have an action of as high a nature, because it concerns his inheritance; as e. g. if he is barred in a foramen in def. yet he may have a foramen in the remainder, &c. 6 Rep. 7. It has been resolved, that a bar in any action, real or personal, by judgment upon demurrer, verdict, or confession, is a bar to that action, or any action of the like nature for ever; but, according to Pemberton, chief justice, this is to be understood, when it doth appear that the evidence in one action would maintain the other; for otherwise the court shall intend that the party hath mistaken his action; Skir. 57. 58.

Bar to a common intent is good; and if an executor be sued for his tate's debt, and he pleadeth that he had no goods
BAR

goods in his hands at the day, when the writ was taken out against him, that is a good bar to a common intendment, till it is shown there are goods; but if the plaintiff can shew, by way of replication, that more goods have fallen into his hands since that time, then, except the defendant allege a better bar, he shall be condemned in the action. Plow. 26. Kitch. 215. Bro. tit. Barre. See Plea.

Bar of Dozer. See Dower.

Bar, Trial at. See Trial.

Bar, in the Mange, denotes the ridge or upper part of the gums, between the tubules and grinders of a horse; the under and outward sides retaining the same gum.

The bars should be sharp-rigged and long; for since all the subjection a horse suffers, proceeds from those parts, if they have not these qualities, they will be very little, or not at all sensible; so that the horse can never have a good mouth; for if the bars be flat, round, and inelastic, the bit will not have its effect; and, consequently, such a horse can be no more governed by his bridle, than if one took hold of his tail. These ridges are always more prominent in young horses than in those that are old. See Lambs.

Bar, in Music, denotes strokes drawn perpendicularly across the lines of a piece of music, including between each two, a certain quantity or measure of time, which is various as the time is triple or common.

The use of bars in music is a modern invention. They cannot be traced higher than the year 1574, and seem not to have been in general use till about the middle of the 17th century. It is not easy to imagine how music in many parts could be composed without bars, or how the maxima, or large, equal to eight semibreves, could be divided into bars of one or two semibreves in each. See Battuta, and Time-table. A double bar implies the end of a strain. When double bars are dotted on both sides, thus,

---

the dots imply a repetition of each strain; but if dotted only on one side, that strain only which precedes or follows the dots, is to be repeated.

Bar-Mijfer, in Mining, he who keeps the gage or diff, to measure all miners ore; he, or his servant, being always to be present when it is measured.

Bar, among Printers, denotes a piece of iron with a wooden handle, whereby the cover of the press is turned in printing.

BAR, in Ancient Geography, an island of Italy, in the vicinity of Brundusium. Felix says, that the inhabitants of this island built the town of Barium.—Alfo, a port of Astatic Sarmatia.

BARA, in Geography. See Bara.

BARABA, in Ancient Geography, the name of a metropolitan city of Arabia Felix, according to some copies of Ptolemy and Ammianus Marcellinus.

BARABA, in Geography, a fleppe or moor in the Russian empire, occupies the space between the Iryth and the Obi, southward of the mountain, northward to the farther side of the Tars, and beyond the river Tuy. This extensive region, in length from north to south exceeding six hundred versts, and full four hundred in breadth from west to east, is one continued flat, scarcely interrupted by a single hill, though containing many fresh water lakes, with some of bitter, and a few of common salt. This plain is for the most part of a good black soil, having the face of it elucidated by a number of pleasant forests of birch. All serving to swell, says Mr. Falk, that the Baraba muft have formerly been one general bed of waters, and since more marshy and replete with lakes than it is at present. Even within the memory of man, according to the affirmation of the Barabinzes, the diminution of the lakes, and the exsiccation of the pools, read plots, and marshes, have been very obfervable, as well as the acquisitions thus made by the firm land. See Tooke’s View of the Russian empire, vol. i. p. 149.

BARABALEMO, a river on the coast of Africa, six leagues east from the river of St. Barbara, east from Cape Ferrona.

BARABENSIS, in Entomology, a species of Gryllus (Locust) found about the pine trees in the sandy deserts of Baraba. The wing-cases are pale and sprinkled with brown dots; wings transparent and pale yellow; veins and dots at the margin, and tip brown. Pallas. Size of Gryllus tibiales.

BARABIANCO, in Geography, a town of Italy, in the Millanes, situate on the rive, four miles west of Milan.

BARABIELLO SIND, lies at the bottom of Bengal bay, within the river of Hughly.

BARABINIAN, a nation of the Russian empire. On entering the vall region of Siberia by the west, the first country we come to is that of the Barabines. The large fleppe, inclosed between the Oby and the Iryth, and reaching as far as the Altay mountains, is called Barama; this appellation the Russians have corrupted into Baraba, and the people who occupy that defect they call Barabinzi, or Barabines. The Barabinines, at the time of the conquest of Siberia, had already suffered too much from the turbulence and ferocity of their neighbours, for being able to raise themselves to a numerous population; and, remembering nothing but their misfortunes, they have forgotten whether they ever were governed by savages of their own. At length, successively oppressed by the Kirghizes and the Soongares, they at present enjoy tranquility under the protection of Russa, who, in consideration of an easy tribute, takes charge of their defence. A mixture of several nations is discernible among them. They have, in general, the Tartarian phylogonomy: but a flat face; the long eyes and little opened, and the hanging ears, are testimonies that some of them are of Mongolian race. The Soongares, their conquerors, at different times lived among, and probably are the progenitors of the Barabinines. The Barabinines live with Kalmuc countenances. The idiom of the Barabinines is a dialect of the Tartar language, and bears witness to their primeval origin. It is corrupted, but less than that of the Bashkirs. They live, however, in equal ignorance, and fearfully any of them know how to read. The humid vapours that arise in their fleppe, and give a density to the atmosphere, render the inhabitants fmall and phlegmatic; their indifference and their apathy border on stupidity. In respect to them we might be tempted to adopt the expression of Le Cat, and regard them, not so much as men animated by the heat of the blood, and the spirits fluid of the nerves, but as hydraulic machines. This machinal flate correpsonds with their misery, and enables them to endure it without pain. Temperate alike in their amours and in their diet, with defires fo feeble and fo confined as to be easily gratified, they know nothing of robbery or theft; they are even ignorant of lying, having no use for it except for covering a slight fault, in order to gain time for repairing it. They have stationary habitations for the winter; and sow a little barley or oats, sometimes a small matter of hemp; but their culture is always of scanty production; their fleppe, poor in game, ill requires the fatigue of the hunter. They derive a slender profit from their flocks and herds, and a great number of fishermen owe their subsistence to the lakes. It is not uncommon in winter for the snow to envelope their huts in such manner that they could not get out were they to neglect to make a passage through the roof. Their summer dwellings are covered only with mats. Their herds, by no means numerous, though forming their principal wealth, consist of herds and horne cattle; the humidity of the soil hardly allows
allows them to rear a few sheep. A great number of them poseffes not a single head of cattle; and a man poseffes for opul- 

cent who has from five to twenty horses, with fill fewer 

horncd cattle. It is not long since the richest man of the 

nation poseffed seventy horses. It should seem that their 

droves would inefcarce since they have no longer to dread 

the ravages of the Kirghifes; but a mortality among their cattle 

filled up the measure of their wretchednes, when they 

thought it drawing near to its end. Exempted from other 

cares than those of the pastoral life, all have leisure to follow 

the fisheery; they prefer the fish without fishing, by letting 

it dry on the ground. Awkward in the use of the bow, 

they are obliged to take the game in fnares, in nets, or by 

the aid of their dogs. These animals are excellent couriers, 

and their masters would not truck a good dog against a 

horse.

The women dress the skins of the birds that frequent the 

lakes, making them into pellices, which they sell. These 

pellices are very warm, last a long time, and are impenetrable 

to moifure. Every village has a chief, and each district its 
youta, who is a sort of prince. The nation grants them 

no revenue; all they get by their elevation is the pleafure 
of being refrained, and of feeming to be obeyed. Confufed 

lefs as judges than arbitrators, it is eafy for them to set-

tle disputes between pleaders, to whom it is almost the fame 

thing to gain or to lose their caufe, and they are fearely 

capable of conceiving a defire.

It has been faid, that the Mohammedans never attempt to 

make profeffes; this seems to be a miifake. Towards the 

middle of the late century, the Barbabinians were fill devoted 

to Shamamif, when they were converted to Mohomedan-

fim by the zeal of fome neighbouring Mohulfs, who came and 

preached in their fipples. At preient they have feveral futs 

which they call moqefes, fome men who cannot read, whom 

they call prieffes, and by changmg their faith they have only 

acquired a few additional fuperftitions.*

BARACE, a town of France, in the department of the 

Mayne and Loire, and chief place of a canton in the district 
of Chateauneuf, four leagues N. N. E. of Angers, and two 

E. E. of Chateauneuf.

BARAC, or Becar, in Ancient Geography, a town of India 
on this fide of the Ganges, in the gulf of Cantii, according 
to Ptolemy. It was situated at the mouth of the river, 

which pafled to Nelcordia, according to the author of the 

Periplus of the Erythrean Sea. It was a large, commodious 

port, and better floored with merchandise than Muziris, 

from which it was not fo dilant; and as the pepper of 

Cottonara was brought to this place in small boates, it may 

be concluded that Barace was within, or near to the country 
of Canara, which produces the bell pepper in thofe parts at 

the prefent day. Major Renell fays, that after much in-

evigation, he cannot apply to any particular spot thofe 

ports of Muziris and Barace; for the Malabar coafl abounds 

with ports of fimilar defcription; however, from the lights 

furnished by Pliny and Ptolemy, he conceives they were 

fitted between Goa and Tellicherry, and that the modern 

Meerzaw or Merjee is the Muziris of the ancient, and Bar-
celore or Baffnore, which is one of the principal pepper 

factories at prefent, their Barace. M. d’Anville informs 

Barace to be Nefyenda, which Renell takes to be Nef-

BARACK, or BARAC, BARACE, a hut or little 

lodge for soldiers in a camp.

The word comes from the Spanish barracas, little cabins, 

which ffaithmen make on the sea-fhore.

Thofe for the horse were formerly called baracks; and 

thofe for the foot, huts: but barack is now ufed indifferently 

for both.

Baracks are generally made by fixing four forked poles in 

the ground, and laying four others across them; afterwards 

they build up the walls with fods, wattles, or what the place 

affords; and the top is planked, thatched, or covered with 

turf, as they have convenience.

When the army is in winter quarters, the soldiers usually 

build baracks; in the summer they are content with their 
tents.

Baracks is also more generally applied to buildings 

to lodge soldiers in fortified towns, or others. Thus we lay 

the baracks of the Savoy, of Dublin, &c.

Baracks, when damp, are greatly prejudicial to the health 
of the soldiers lodged in them; occafioning dyfenteries, in-

termittent fevers, coughs, rheumatic pains, &c. For which 

reason quarter-masters ought to be careful in examining every 

barack offered by the captains of a place; rejecting all 

ground-floors in houfes that have either been uninhabited, or 

have any signs of moifure. See CASES.

Barack-Allowance, a specific allowance of bread, beer, 

coals, &c. to the regiments stationed in baracks.

Barack-Guard, the principal guard of a regiment in 

baracks; the officer of which is responsible for the regularity 
of the men, and for all prisoners duly committed to his charge 

while on that duty.

Barack-Maifer-General, a paff-officer at the head of the 

barack-department, who has a number of barack-maifers 

and deputies under him, that are stationed at the different 

baracks. He has an office and clerks for the dispatch of bui-

nels; and to this office all reports, &c. respecting the barack 

department are made.

BARACOA, in Geography, a fea-port town on the 

north-eaft end of the ifland of Cuba, having a good harbour 

for small vessels, but not for large ships; dilant about feven-

teen leagues north-eaft from St. Jago. N. lat. 21° 4'.

W. long. 76° 10'.

BARACUM, in Ancient Geography, a town of the inte-

rior part of Africa, which Pliny mentions among the con-

quests of Cornelius Balbus.

BARACURA, a commercial town of India, on the other 

fide of the Ganges. Ptolemy.

BARACUS, a river of India, in the fouthern part of the 

ifland of Taprobana. Ptolemy.

BARAD, a town of Palestine, in the southem part of 

the tribe of Juda, according to the book of Numbers.

BARADEUS, or ZANAULUS, JACOBUS, in Biography, 

an obilcre monk of the fifth century, who revived the fett 
of the Monophysites, when it was juft expiring, to its for-

mer prosperity and luftre. For this purpose, after having 

been ordained to the epifcopal office by a few captive bishops, 

he travelled on foot through the whole eft, eftablished bishops 

and prelates every where, revived the drooping fpirits of the 

Monophysites, and produced fuch an aftonifhing change in 

their affairs by the power of his eloquence, and by his 

incredible diligence and activity, that when he died bishop 
of Edea, A. D. 588, he left his fect in a moft flourifhing 

flate in Syria, Melopotamia, Armenia, Egypt, Nubia, Aby-

linia, and other countries. This poor monk had the will 

tion to convert the means ofucces, as well as activity to put 

them in execution; for he almost totally extinguifhed all the 

animosities, and reconciled all the fects, that had divided 

the Monophysites; and when their churches became fo nu-

merous in the eft, that they could not all be comprehended 

under the fake jurifdiction of the patriarch of Antioch, he 

appointed as his affitant, the primate of the eft, whose refe-

dance was at Tagritis, on the borders of Armenia. The labo-

rious efforts of Jacob were fecended in Egypt and the adjac-

ent countries by Theodofius, bishop of Alexandria; and he 
became fo famous, that all the Monophysites of the eft 

considered
considered him as their second parent and founder; and they are to this day called Jacobites, in honour of their new chief. Molheim Eccl. Hist. vol. ii. p. 145. See Monophysites, and Jacobites.

BARADERS, in Geography, a small bay on the north coast of the peninsula at the west end of the island of St. Domingo, or Hispaniola. It is almost land-locked, having a small island near the bottom in the south-east corner. N. lat. 18° 32'. W. long. 73° 37'.

BARADY, BARRADY, or BARRAD, a river of Syria, called by the ancients Chrysoforia, or the golden river; and by the Syrians, Pharpar; which, rising from Antilibanus, descends to Damascus, and is there divided into endless streams, for the supply and decoration of that city; but uniting again at some distance from it, they bore themselves in a serpentine. The rivers Abana and Pharpar, the names of which are lost among the Arabian geographers, Manneur, and those fables must have been branches of this river Barady, which issues out of the rock.

BARAE, in Ancient Geography, a people of India, placed by Ptolemy near the Ganges.

BARAFAT, in Geography, a town of Africa, in the kingdom of Fonia, seated on a peninsula formed by the river Gambia and two other rivers.

BARAGAZA, a town of Ethiopia, on the Red Sea, mentioned by Pliny.

BARALIPTON, a term in Logic, denoting the first indirect mode of the first figure of syllogisms.

A syllogism in baralipon is when the two first propositions thereof are universal affirmative, and the third a particular affirmative; the middle term being the subject of the first, and the attribute of the second. — For example:

| BA | Every evil ought to be feared; |
| RA | Every violent passion is an evil; |
| LIP | Therefore something that ought to be feared is a violent passion. |

See letters A and I, and Syllogism.

BARALLOTTI, the name of a sect at Bologna in Italy, who had all things in common, even their wives and children. They gave it, it is said, in all manner of debauchery, and were also termed compilers.

BARAMATIS, in Ancient Geography, a town of India, on this side of the Ganges. Ptolemy.

BARA-MAREKA, in Botany. See Dolichos.

BARAN, in Geography, a river of Hindoostan, in the province of Cabul, which is joined by the rivers Chugan, Alihung, and Alkar, in the district of Kameh, and runs eastward or south-eastward. But it is not absolutely certain whether these confluent rivers join the river of Cabul above Pahawur, or whether they form a separate river, and pass by Bajore and Sewad.

Major Rennell thinks the former to be the most probable, and that the confluent river receives the name of Kameh, from the district in which the junction takes place, and then communicates it to the Cabul river, during the remainder of its course. Rennell's Mem. p. 156.

BARANCA, or St. Jago, in Geography, a river belonging to Mexico, in North America, which directs its course to the west coast, and falls into the Pacific ocean about ten leagues west by north from Xatifico bay.

BARANCA del Malambo, a sea-port town of South America, in the country of New Cartific or Terra Firma, on the east side of the Rio Grande, at the mouth of the river Magdelana, with a good harbour. This is a place of considerable commerce; as the merchandise of New Granada is brought down either by boats, and conveyed to the bay about 40 miles below the town, or else directly to Santa Martha, by a branch of the great river; the chief article is

falt, which is produced in the neighbourhood of the town. It is distant 25 miles north-east from Cartagena. N. lat. 11° 40'. W. long. 73° 40'.

BARANCA-Las, a town of North America, in the province of New Mexico, 45 miles S.S.E. of Santa Fe.

BARANKE-STANITZ, a town or settlement in Siberia, on the Lena, 52 miles north-east of Votkinsoi. N. lat. 54° 50'. E. long. 113° 14'.

BARANGE, in Ancient Geography, a town of Aisia, in Hyrcania. Ptolemy.

BARANGI, officers among the Greeks of the lower empire, whose business it was to keep the keys of the city-gates where the emperor resided.

Codinus says, that the bargangi were those who fixed guard at the door of the emperor's bed-chamber and dining-room.

Codinus and Curiopata observe, that the name is English, formed from bar, to fast; and that the barangi were Englishmen by country; Anglo-Danes, who, being driven out of England, were received into the service of the emperor of Constantinople, and made guards or protectors of his person. Whence they are called in Latin, by Cujacius, protectores; and by others, securigers, as being armed with a battle-axe, securtir. Codinus adds, that they still spoke the English tongue. Anna Comnena says, the barangi came from the island Thule, by which is doubtless meant our island. Yet Nicetas makes them Germans; a mistake easy to be made at that distance, considering the relation the Anglo-Saxons bore to Germany. There were barangi as early as the emperor Michael Paphlagonius, in the year 1035; as appears from Cedrenus; but they were then only common soldiers, not a life-guard.

Their commander was called after them, as importing a person who always followed the emperor.

BARNILLO, in Geography, a town of Italy, in the kingdom of Naples, and convent of Molife, nine miles S.S.E. of Molife.

BARANOW, a town of Poland, in the palatinate of Sandomir, sixteen miles south of Sandomir.

BARANOWKA, a town of Poland, in the palatinate of Volhynia; 40 miles N.N.E. of Constantinople.

BARANZANO, Redemptus, in Biography, a Barnabite friar, was born in 1550, at Sarawile, a town of Vercelli, in Piedmont, and obtained eminence at the commencement of the seventeenth century, by daring to abandon the Aristotelian method of philosophy. That he coincided in his ideas with those of the illustrious Lord Bacon, appears from a letter written to him on this subject, by this referrer of philosophy, in June 1622, and preferred in the third volume of "Nichelle's Memoirs." Having taught mathematics and philosophy at Ameghi, he went to Paris, and formed an intimate friendship with Le Mothe Le Vayer, who speaks of him (Ovwr. 12mo. tom. iv. p. 172.) as one of the first wits of the age. He adds, that this honest Barnabite had several times affur'd him, but always with submission to the good pleasure of God, that he would appear to him, if he should depart first out of this world. However his promise was not fulfilled, and he verified the sentence of a Latin poet, Catullus, Epigr. iii.

"Qui nunc ita per iter tenebricous
Ille, unde negant redire quamquam."

"He paused the dark and dreary way
From whence there's no return to the bright genial day."

He died at Montargis in 1622. His works are "Urano-

scopia."
BAR

BAR

feputia," or the universal doctrine of the heavens, printed in folio, in 1617; *Campus Philosophicus," the first part of his Summary of Philosophy, as taught at Ancie, printed at Lyons, in 8vo, in 1619; and "De Novis Opinionibus Physicis," printed at Lyons, in the same year. Gen. Dict.

BARAO, in Geography, a town of Spain, in Arragon, two leagues from Jaca.

BARA-PICKLE, bread made of fine flour kneaded with barn, which makes it very light and sponge: *bara being the Welsh for bread.

BARAQUICIMITO, in Geography, a town in Terra Tinn, South America, in the province of Caracas, and in the head waters of Oroonoko river, about 85 miles south from Valencia, and 175 north-west from Calabaza. N. lat. 3° 55'. W. long. 66° 55'.

BARASA, in Ancient Geography, a town of Paleline, according to Josephus.

BARASZE, in Geography, a town of Poland, in the palatinate of Yolluvia, 26 miles N.N.W. of Zytonomiers.

BARATHIER, Bartelamy, in Geography, an Italian lawyer of the 15th century, was born in Placentia, and taught the Roman feudal law at Pavia and Ferrara, which he ranged anew, and then formed a text book for the school. The work was printed at Paris in 1611, under the title "De Feudis Liber Singularis;" and in 1695, by Schiller, under its true title "Libellus Feudorum reformatus." Mo- roni.

BARATHRUM, from Beathrum, signifying the fame, among the Ancient Athenians, a deep pit belonging to the tribe Hippothoennesis, into which condemned criminals were cast headlong.

The barathrum was a dark noisome hole, having sharp spikes at the top, to prevent any escape, and others at the bottom to pierce and lacerate the offender.

From its depth and capaciousness, the name came to be used proverbially for a mifer, or a glutton, always craving. In which sense, the word barathrum is used among the Latin poets.

Thus Horace, Epil. i. i. ep. 15. v. 631.

"Perrucies, et tempestas, barathrumque Macelli,
Quiequisqueque, ventrini donaret avaro."

It is also used for a common prostitute, by Plautus (Bacchid. i. 2. 445), thus:

"O barathrum, ubi nunc es? ut ego te ufarper libens!"

Barathrum is also used, in Phylology, to denote certain baleful caverns, inaccessible on account of their fetid or poisonou s fumes.

Thefe amount to the fame with what others call falle charameri.

BARATIER, John Philip, in Biography, a learned German, was born in 1721, at Schwobach near Nuremberg. Under the instruction of his father he is said to have understood the Greek, Latin, German, and French languages, when he was five years old; and he acquired also the knowledge of the Hebrew in one year, so as to be able to read the historical books of the bible: and at the age of nine years, he could not only translate the Hebrew text into Latin or French, but also re-translate these versions into Hebrew. At this age he could also repeat memoria the Hebrew psalter, in consequence of merely reading it with his father. Before he had completed his tenth year, he composed a Hebrew lexicon of rare and difficult words, with curious critical remarks. In 1731, he was matriculated in the university of Altdorf; and in this year he wrote a French "letter to M. le Maitre, minister of the French church at Schwobach, on a new edition of the bible, Hebrew, Chaldaic, and Rabbinical," which letter is preserved in the twenty-sixth volume of the "Bibliotheque Germanique." In 1733, the margrave of Anspach granted him a pension of fifty florins a year, and allowed him the free use of books from the library at Anspach. As the fruits of his application to study, he translated from the Hebrew, with historical and critical notes and dissertations, of "The Rabbi Benjamin's Travels in Europe, Asia, and Africa, containing an account of the state of the Jews in the twelfth century," was published, in two volumes 8vo. at Amsterdam, in 1734; the author being at this time in his thirteenth year; and the whole work is said to have been finished in four months. Notwithstanding the extent of his philosophical pursuits, this astonishing youth applied to the study of mathematics and philosophy with such success, that he devised a method of finding the longitude at sea, which was laid before the Royal Academy of Sciences at Berlin, in a long letter, dated Jan. 21, 1735, the day in which he completed his fourteenth year. His letter being well received, he determined to visit Berlin, with a view of enforcing his project: but in his way thither he passed through Hall, where Ludewig, the chancellor of the university, offered to confer upon him the honorary degree of doctor of arts. Flattered by this proposal, Baratier immediately, in the presence of many professors, drew up fourteen theses in philology, ecclesiastical history, and philosophy, which were printed the same night, and which he supported for three hours the next day with great applause; upon which he was admitted master of arts in philosophy. He then pursued his journey to Berlin; and, in the presence of the mathematical chaf, replied in French to some objections that were urged by M. de Vigneoles, the rector, against his scheme; and he then proposed, in Latin, the plan of an astronomical instrument, which he offered to execute. M. Jabloniki, the prefect, reported, that he had examined Baratier, in the king's presence, and that he had found him well acquainted with rabbinical learning, the oriental languages, and ecclesiastical history; and he was then, with the ufual form, admitted a member of the society. Upon his return to Hall with his father, he directed his attention to theology, and wrote an answer in Latin to Celsius, who, under the assumed name of Artemonius, had published a Socinian interpretation of the introduction to the gospel of St. John. This was intitled "Anti-Artemonius," and published at Nuremberg, in 1735. It was accompanied with a "Dissertation on the three dialogues, commonly attributed to Theodoret," intended to invalidate their authenticity. In 1735, he defended this piece against the attacks of the journalists of Treves, in another dissertation, which was printed in the forty-eighth volume of the "Bibliotheque Germanique." In the fortieth volume of the same journal, there is another dissertation of Baratier "On two works attributed to Athanasius." Baratier being obliged to confess his ignorance of the public law, in reply to the inquiry proposed to him by the king of Prussia, was commanded by the king to go and study it, before he called himself a learned man. Such was his literary ambition, that he applied immediately to the study of it, and after fifteen months he supported a thesis on the subject with great credit. The uninterrupted exertion of his faculties soon impaired his constitution, which was naturally delicate and feeble; and after languishing in a decline for several months, Baratier died at the age of nineteen years, eight months and seven days. His attainments were surprising; and yet it is said that, before he was ten years of age, he was accustomed to lie in bed twelve hours, and ten hours from that time to his death. The facts above adduced may seem truly astonishing; but they are founded upon unquestionable testimony. Some few ex-amples
a similar kind have occurred; however they should by no means be contemplated as patterns of imitation or as models of perfection. "The popular, which foundation a lofty tree, will soon decay: the strong and sturdy oak, whose majestic trunk stands uninjured through centuries, requires a century to bring it to maturity." Forney's Life of Baratier. Now. Dict. Hiftor.

BARATO, Cape, in Geography, lies on the coast of Italy, on the north side of the peninsula of Piombino, and about S.S.E. from Leghorn. It has a small bay on the S.W. before which is anchorage.

BARATUR, in Antiquity, denotes, according to Hefychius, sacred games, celebrated at Thebapton, in which the most notable of the combatants was crowned.

BARATRY, BARETRY, or BARETRY, in Law, signifies the moving and maintaining of suits in disturbance of the peace; and the taking and detaining of hones, lands, &c., by false inventions. 8 Rep. 257. 1 Hawk. P.C. 343. The word baretry, in French, signifies mischievous frauds; it is derived from the old word barat, which signifies any imposition; whence also tley said Baratier, to impose on any one.

The punishment for this offence, in a common person, is by fine and imprisonment; but if the offender belongs to the profession of the law, a barrister who is thus able as well willing to do mischief, ought also to be disabled from practising for the future. However it seems clear that no general insinuation, charging the defendant with being a common oppressor and disturber of the peace, and stirrer up of strife among neighbours, is good without adding the words "Common Barrister," which is a term of art appropriated by law to this purpose. 1 Mod. 358. 1 Sib. 251. 2 Cro. Jac. 326. 1 Hawk. P.C. 81, § 9. No man can be a barrister in respect of one act only; and it hath been holden, that a man shall not be adjudged a barrister for bringing any number of suits in his own right, though they are vexations, especially if there be any colour for them; for if they prove false, he shall pay the defendant costs. 1 Rol. Abr. 355. 3 Mod. 98. A common solicitor who solicits suits, is a common barrister, and may be indicted thereof, because it is no profession in law. 1 Danv. Abr. 175.

It is enacted by statute 12 George I. c. 29, that if any one, who has been convicted of forgery, perjury, subornation of perjury, or common barratry, shall practise as an attorney, solicitor, or agent, in any suit, the court upon complaint, shall examine it in a summary way; and, if proved, shall direct the offender to be transported for seven years. To this head may also be referred another offence of equal malignity and audacity, that of suing another in the name of a fictitious plaintiff; either one not in being at all, or one who is ignorant of the fact. This offence, if committed in any of the king's superior courts, is, as a high contempt, to be punished at their discretion. But in courts of a lower degree, where the crime is equally pernicious, but the authority of the judges not equally extensive, it is directed by statute 8 Eliz. c. 2, to be punished by six months imprisonment, and trouble and damages to the party injured. Black. Comm. v. iv. p. 134.

BARATRY, in a Marine Sense, is the master of a ship, or the mariners, cheating the owners or insurers, whether it be done by running away with the ship, flinking her, defecting her, or embezlling the cargo.

Baratry of mariners is so epidemic on ship-board, that it is rare if the master, be his industry ever so great, can prevent it, by reason of the encouragement one knavish sailor gives another; yet the law, in such cases, imputes the offences of the mariners to the negligence of the master, and from him the merchant is to leck for remedy for all goods or merchandise lost, embezzled, or otherwise damaged.

By the French ordinances, insurers are not obliged to make good the loss or damage accruing to a vessel, or its holding, by the fault of the master or crew, unless by the forms of the policy, they may be made accountable for the baratry of the partners. A master, who, without necessity, takes up money on the bond, provision, or tackling of a ship, or sells the effects on board, or, in his account of average, sets down fictitious expenses, shall pay the value, be declared unworthy of being master, and banished the port where he ordinarily resided. In some cases, he is also subject to corporal punishment, and even to death, where it appears he willingly threw away their ship.

Baratry is also used for bribery or corruption in a judge, giving a false sentence for money.

BARATRY is also used in Middle Age Writers, for fraud or deceit in making of contracts, sales, or the like.

BARATTA, or BARATTA, in Ancient Geography, a town of Lucania, mentioned by Ptolemy.

BARAVEL, St., in Geography, one of the Ladron islands, lies south of the island of Guam, and was one of those discovered by Magellan, and described by Pignetta. Besides this, there were also between 10th and 13th N. lat. the islands of Ban and Botu, and the shalow of Santa Rosa. N. lat. 120° 44'. E. long. 142° 28'. See LADRONES.

BARAVOE, a bay and village, on the north-east coast of the island of Shetland.

BARAWNY, a town of Hindooftan, in the country of Candehil, forty miles N.E. of Burlham, and seventy-four S.S.E. of Indore.

BARAZA, in Ancient Geography, a town of Armenia Major. Ptolemy.

BARAZA, St., in Geography. See St. BARABA.

BARB, in Ornithology, is used for the Barbary pigeon, the COLOMBA NUMIDICA of Moore.

BARBA, in Ancient Geography, a town of Spain, in Betica, placed in the Itin. of Antoninus, twenty miles from Olippo, and twenty-four miles from Antiquaria.

BARBA, in Geography, a town of North America, in the country of Mexico, and province of Costa Rica, twenty-two miles S.S.W. of Cartago.

Barba Aron, in Botany, a name given by some authors to the common great houfe-leeke.

Barba Caprae. See SPIRAEA.

Barba Jovis. See AMORPHA, ANThYLLIS, CYTISUS, EBEUS, and PSEORAE.

BARBACAN, or BARBACAN, in the History of our Ancient Fortifications, was a fort of advanced work which frequently covered the drawbridge at the entrance of a caile.

In which sense, barbarcan amounts to the same with what is otherwise called, antemural, promurals, murus exterior, or outer wall. In towns and large fortresses the barbarcans were large and strong, frequently having a ditch and drawbridge of their own. (See Grofe's Hist. Eng. Army, II. 2.) The term is still preferred in the ruins of several of our cailes; a small stone work covering the gate of Bodham caile in Suffux, is still called the barbarcan; and some work of a similar kind undoubtedly gave its name to one of the streets at the north-west end of ancient London. Barbarcans are also mentioned in Framburgh and Canterbury cailes. For the repairing of this work, a tax called barbarcaneage was levied on certain lands. Grofe Antiq. Pref. i. 5.

Barbacan is also used for a fort at the entrance of a bridge, or in the outlet of a city, having a double wall with towers. Such is that at one end of the wooden bridge at Rouen, which is still called by some Barbacana.

Barbacan
BAR

BARBADIAN is also used for an aperitif in the walls of a city, through which to fire with minnits on the cuemy.

See EMBASEMENT.

BARBACAN, in Architecture, denotes a long narrow canal or opening left in the walls for water to come in and go out at, when edifices are raised in places liable to be overflowed; or to drain off the water from a terrace, or the like.

BARBACAO POINT, in Geography, the eold point of St. Pedro's channel, at the south-euth end of the island on which the city of Cadiz is situated.

BARBACOS, a river on the coast of America, in the Pacific ocean, nearly east of the island of Gallo. Barbaco point is situate ten leagues from the river Tellembier, in N. lat 2° 45'. W. long. 5° 38' 55'.

BARBADIENSIS, in Conchology, a species of VOLUTA that inhabits the American ocean. The length of this shell is an inch and a half; shape tapering; colour reddish, with very fine transverse daxies; aperture oblong-oval; spire obtuse. Figured only by Lillie, 1819, t. 33: Gmelin.

BARBADIENSIS, in Ornithology, a species of PHITACUS, the ask-fronted parrot of Latham. This bird is about the size of a pigeon, and inhabits Barbadoes; the general colour is green; orbits and front cinereous; crown, chin, cheeks, throat, and leffer wing-coverts yellow; greater ones bluish; many of the primary quill-feathers violet on the outside; the red from the back, and the red blue. Gmelin. The legs are all; claws black.

BARBADOES, in Geography, one of the most important of the Caribbee islands in the West Indies, standing somewhat detached from the rest, about thirty-five degrees from the African islands of Cape Verd. This island was probably first discovered by the Portuguese in their voyages from Brazil, and from them received its present name. It had then neither occupants nor claimants; the Charaibes or Caribbees having deserted it. The Portuguese thought it not of sufficient importance for a settled; and having furnished it with a breed of swine for the use of future navigators, they left it as they found it. The English, in 1605, finding it without inhabitants, took possession of the country by fixing a cross on the spot where James-town was afterwards built, with this inscription: “James king of England and this island;” but they formed no settlement. At this time it was overgrown with woods; but yet it furnished them with a supply of fresh provisions. They found here pigs, pigeons, and parrots, and the caa abounded with fish. Some years after this, a favourable report having been made of its soil, the king, by the warthe of the master and seamen of a ship of Sir William Courteen, lord Ley, afterwards earl of Marlborough, obtained from king James I. a grant of the island to himself and his heirs in perpetuity. Accordingly Courteen, probably under the patronage of Marlborough, projected the establishment of a colony, and sent about 30 planters to plant and fortify the island, who, in 1624, laid the foundation of James-town; and this was the first English settlement on the island. About this time, James Hay, earl of Carlisle, establisht a colony in the island of St Christopher, and obtained from Charles I. a grant of all the Charibbee or Caribbee islands, including Barbadoes. This grant was confirmed by earl Marlborough; but at length a compromise took place; and on the earl of Carlisle's undertaking to pay the annual sum of 300l. to the earl of Marlborough and his heirs for ever, the latter waved his claims; and in 1627 the patent of the former passed the great seal, and he became the sole proprietor. However the earl of Pembroke obtained a re-vestation of Carlisle's patent, and a grant to himself in trust for Courteen, who had projected the first settlement in the island. This grant was afterwards annulled, and the earl of Carlisle was restored to the possession and privileges of which he had been for a short time deprived. Accordingly he proceeded to divide lands to such persons as chose to comply with his laws; and a society of London merchants purchased 15,000 acres, on condition which promised great benefit to the proprietors. These merchants foot over 64 persons, each of whom was authorized to take up 100 acres of land; and thus, in 1628, they established a new colony, which soon overpowered the settlement, and annihilated the interest of Courteen. In 1629, sir William Tufton was sent out by lord Carlisle as chief governor, and he distributed land, amounting to 15,872 acres, into 140 grants; and in 1630, passed several laws; among which was one, for dividing the island into six parishes. During the civil war, the emigrations from the mother country was so great, that in 1650 it was computed there were 20,000 white men in Barbadoes, half of them able to bear arms, and furnishing a regiment of horse to the number of 1000. It seems that about this time the existing governor granted lands to all who applied, on receiving a gratuity for himself; and the claims of the proprietor, whether disputed in the island, or disdained amidst the confusions of war, was at length tacitly relinquished.

The colony, enjoying an unlimited freedom of trade, flourished in a singular manner by its own efforts. In 1646, the son and heir of the earl of Carlisle, the original patentee, revived his claims as hereditary proprietor, and by treaty with lord Willoughby of Parham, conveyed to him all his rights by a lease of 21 years, on condition of receiving one-half of the profits. Lord Willoughby obtained a confirmation as chief governor; and was received by the inhabitants, who were warmly attached to the king's interest, with respect and obedience. But soon after his arrival, the regal authority in England was abolished.

Barbadoes, in 1651, was reduced to the obedience of the new republic, who appointed another governor. Upon the restoration of Charles II., lord Willoughby applied for leave to return to his government of Barbadoes; against which the inhabitants, now apprized of his connection and contract with the earl of Carlisle, and apprehending that they were regarded by these lords as mere tenants at will of their possessions, remonstrated. They pleaded that they were the king's subjects, and solicited his major's support and protection. They objected to the claims of the earl of Carlisle, and insisted that the charter granted to him was void in law. The several allegations and claims of the parties concerned were referred to a committee of the privy-council; and it was finally ordered, that lord Willoughby should repair to his government, and demand the grant and establishment by the assembly of a permanent and irrevocable revenue of 44 per cent to be paid in specie, on all kinds of comodities, the growth of the island, shipped to any part of the world; and the money arising from this revenue was to be applied towards making provision for the earl of Kimboul, the legal representative of lord Carlisle with respect to his rights in the West Indies, who had on this condition promised to surrender the Carlisle patent to the crown, towards paying the annuity of the earl of Marlborough, and towards the discharge of the creditors of both these noblemen. After the extinction of these incumbrances, it was stipulated, that the revenue, subject to the charge of 1200l. per annum to the governor, should be at the disposal of the crown. With these instructions, lord Willoughby returned to his government in 1663. The planters were dissatisfied, and preferred complaints, which, however, were unavailing. At length, finding resistance vain, the assembly paid an act for the purposes that were required, dated Sept. 12, 1663. Thus the proprietary
government was dissolved, and the legislation of the island vested in the crown. The island of Barbadoes is about 21 miles in length and 14 in breadth, and contains 160,470 acres of land, most of which is under cultivation. The soil in the low lands is light, formed of reddish in the shallow parts; on the hills of a chalky mud, and near the sea generally sandy. Of the variety of soil, the black mould is best suited for the cultivation of the cane, and, with the aid of manure, has produced as great returns of sugar in favourable seasons, as in any in the West Indies, the prime lands of St. Kitt’s excepted. About the year 1670, we are assured that Barbadoes could boast of 50,000 whites, and upwards of 100,000 black inhabitants, whose labours are said to have given employment to 60,000 tons of shipping. This account may probably have been exaggerated; but it is certain that the inhabitants of this island have decreased with a rapidity well known in any other country. It appears by authentic returns, that the number of its whites, in 1724, amounted to no more than 18,295, and that of its negroes in 1753 was no more than 69,870. In 1768, the numbers were 16,167 whites, 8,838 free people of colour, and 62,115 negroes. It appears also that the annual produce of this island, particularly of sugar, has decreased in much greater proportion than in any other of the West Indian colonies. Pollethwate calculates the crop of sugar, in 1736, at 22,769 hogheads of 15 cwt. which is equal to 19,800 of 15 cwt.; and the author of the “European Settlements,” published in 1761, calculates the average crop at 25,000 hogheads. If this statement be just, the island has fallen off nearly one-half in the annual growth of its principal staple. In an average of eight years, from 1740 to 1748, the exports were 13,948 hogheads of sugar of 15 cwt.; 12,884,000 pounds of 100 gallons; 60 hogheads of molasses; 4,667 bags of ginger; 600 bags of cotton; and 327 gourds of aloe. The exports on an average of 1784, 1785, and 1786, had fallen to 9,554 hogheads of sugar; 5,448,000 pounds of rum; 6,320 gourds of ginger, 8,331 bags of cotton; exclusively of some smaller articles, as aloes, sweetmeats, &c., of which the quantities are not ascertained. The dreadful destruction of hurricanes, which had occurred within the last twelve years, has, without doubt, contributed to this great defalcation. The capital of this island was fiercely riven from the ashes to which it had been reduced by two dreadful fires, when it was torn from its foundations, and the whole country made a scene of desolation by the storm of the 10th of October in 1780; in which 4,326 of the inhabitants, blacks and whites, miserably perished; and the damage to the country estimated at 1,320,564l. 15s. In the year 1792, the produce of sugar was 11,073 hogheads, 125 tiers, 2,698 barrels; of molasses 188 hogheads; of rum 5,664 hogheads, 512 barrels; of ginger 3,046 bags and barrels; of aloe 515 gourds; and of cotton 67,478 pounds. From the great increase in the export of sugar in this year compared with several of the preceding years, and decrease in that of the minor staples, it seems probable that the advanced price of that article in Europe has encouraged the cultivation of it in plantations which had been formerly abandoned or appropriated to a different kind of culture. The average of the number of negro slaves in Barbadoes for seven years, from 1786 to 1793, was 63,271; of slaves imported 4363, and the average amount of taxes, during the famine period, was 9,530l. 14s. 1d. The taxes consist of a capitation tax on negroes; a tax on sugar-mills, dwelling-houses, and carriages, together with an excise, &c. on wines imported. Besides which there is a parochial tax on land, amounting on an average throughout the island to about two shillings per acre, and an assessment in labour for the repair of the highways. The whole is altogether exclusive of the heavy duty of 4s per cent to the crown. Barbadoes is divided into 5 districts and 11 parishes; and contains 4 towns: viz. Bridgetown, Oils or Charles-town, St. James's formerly called the Hole, and Speight's-town. Bridgetown is the capital, and the residence of the governor, whose annual salary is 2000l per annum, paid out of the exchequer, and charged to the account of the 4s per cent duty. The form of the government of this island resembles that of Jamaica, except that the council is composed of 12 members, and the assembly of 22. The most important variation respects the court of chancery, which in Barbadoes is constituted of the governor and council, whereas in Jamaica the governor is sole chancellor. On the other hand, in Barbadoes, the governor sits in council, even when the latter are acting in a legislative capacity, which would be considered, in Jamaica, as improper and unconstitutional. It may also be observed, that the courts of grand seions, common pleas, and exchequer, in Barbadoes, are distinct from each other; and not, as in Jamaica, united and blended in one supreme court of judicature. The heat of the climate is moderated by the trade-winds, and the air is pure. Its products, besides what we have already mentioned, are the palm, tamarind, figs, bananas, cedars, mahogan, cacao, papas, guavas, and pamplemousses. Barbadoes is situated in N. lat. 13° 10'. W. long. 59°. See Edwards's History of the West Indies, vol. p. 321—320. Barbadoes Buffard-Cedar, in Botany. See Cedrela. Barbadoes Cherry. See Malphigia. Barbadoes Flower-square. See Poinciana. Barbadoes Gooseberry. See Cactus Pereskia. Barbadoes Wild-Orange. See Bontia. Barbadoes Tur. in the Materia Medica. See Petroleum Barbadiano. Barbador, Barbadera, or Cape Barba, in Geography. See Cape Bara. Barbalis, in Entomology, a species of Phalena, that feeds on the trifolium pratense. The antennae pectinated; feelers shorter; anterior thighs with a projecting beard. Barbalissus, in Ancient Geography, Belus, a considerable town of Asia, in Syria, near the Euphrates, E.S.E. of Hierapolis. This is the Barbarissus of Polyeon, according to M. D'Anville. Barbana, or Barrana, a river of Illyrium, which sprang from the Labeatid Marth, according to Livy. Barbana, in Geography, a town of Iliria, seven miles N.N.E. of Pola. Barbano, a small island in the northern part of the Adriatic, near the coast of Friuli. N. lat. 45° 45'. E. long. 13° 28'. Barbalona, Cape, is the south of Smyrna gulf, on the coast of Asia, at the east extremity of the Mediterranean, and nine leagues S. by W. from Porto Gero. Barbao, a province of Abydania, separated from Atbara by the river Tezazz; the capital of which is Gooz, which see. Barbara, in Conchology, a species of Helix, with an oblong, coarse, imperforated shell, with eight whorls, and a subround lunate aperture. This kind inhabits Algiers. Somewhat resembles helix papu, but is not above half the size, being usually about the bigness of a barley-corn. Gmel. &c. Barbara, in Entomology, a species of Formica that inhabits Africa, and is as large as F. herculanea. It is black, with the head, antennae, and extremity of the legs ferruginous.

**Bartholomew Rofa,** in Geography, are situated three leagues west from the river Turiones; the bay of Triflo lies W.S.W. from them, on the Spanish main; and their islands are between the main and Venezuela, nearly west from the latter.

**Bardaeum.** See **Calypso.**

**Barbarian,** in Zoology, the name given by Buffon to the Barbary squirrel; *sciurus granivorus* of Schreiber and Gmelin.

**Barbaria,** in Ancient Geography, the name given in the Periplus of the Erythraean sea to the kingdom of Alhibinia, now called *Adel,* the coast of which extends from the straits of Babelmandel to cape Garfenced, about 450 geographical miles, and contains, according to the Periplus, four principal ports or anchorages, called by the general name of Tapera, the precise situation of which is not ascertained.

**Barbarian,** in Antiquity, a name given by the ancient Greeks to all those who were not of their own country, or who did not speak the Greek language, or who did not speak it so well as themselves. In which sense the word signified with them no more than *foreigner,* and did not carry that odium with it which it does now. Strabo derivs the word *βαρβαρος* from *βαρβαρος, bulbinus,* because foreigners coming to Athens used to flammer, or speak coarsely; others derive it from *βαρβάς,* a word that foreigners frequently stumbled on, which yet had no meaning.

The Greeks had such an high opinion of the pre-eminence to which they were raised by civilization and science, that they looked hardly to have acknowledged the veil of mankind to be of the same species with themselves. To every other people they gave the degrading appellation of Barbarians; and, in consequence of their own haughty superiority, they affected a right of dominion over them, in the same manner, to use their own expression, as the soul has over the body, and men have over irrational animals. Extravagant as this pretension may now appear, it found admittance, to the disgrace of ancient philosophy, into all the schools. Aristotle, full of this opinion, in support of which he employs arguments more subtle than solid (Polit. i. c. 3—5) advised Alexander to govern the Greeks like subjects, and the Barbarians as slaves; to consider the former as companions, and the latter as creatures of an inferior nature. But the sentiments of the pupil were more enlarged than those of his master; and his experience in governing men taught the monarch what the speculative science of the philosopher did not discover. See Plin. de Fortun. Aleth. Orat. i. Strabo, lib. i. p. 116. A.

The Greeks gave the denomination of Barbarians in a peculiar manner, and with a contempt blended with animosity, to the Phrygians, on account of the enmity that had subsisted between them since the wars of Troy. This appears in the "Orphics" of Euripides, and in the scholia upon the "Ajax Malignophorus" of Sophocles. The Roman
BAR

Barbarians also, in imitation of the Greeks, called all other people, the Greeks excepted, barbarian; and the complaint was returned to them by the inhabitants of other nations. Timis Ovid, who was considered at Rome as a polished courtier, was treated in his exile as a barbarian by the Cetara, who did not understand his language, which was the idiom of Rome. Tril. i. v. cl. x. v. 37.

"Barbarus hic ego fui quae non intelligor ulli: Et ridendo fulvus virga Latine Cetar." [1]

Under the lower empire, the appellation of barbarian became almost synonymous with that of stranger or foreigner. The Burgundians and Franks, who were established in Gaul, were there called barbarians; and in Italy this name was given to the Goths. The term was also applied by the 52d canon of the African church to the inhabitants of those provinces which had not submitted to the Roman empire; and the denomination is frequently extended by Gregory of Tours, and also by other writers, to Pagans as contradistinguished from Christians.

BARBARIANA, in Ancient Geography, a town of Spain, placed in the Anton. Hist. between Asturias and Grecucris.

BARBARIC PHILOSOPHY, comprehends that of all ancient nations among whom the Greek language was not spoken. It has long been a subject of dispute, whether philosophy first appeared among the barbarians or among the Greeks. The inhabitants of Greece, who were at an early period remarkable for literary and philosophical vanity, and who soon acquired the use of an artificial method of philosophizing, were unwilling to allow that philosophy had any existence in other countries, except where it had been borrowed from them. They could not persuade themselves, that the mere communication of precepts of wisdom in the simple form of tradition, and in languages harsh and different compared with their own, could deserve to be called philosophizing. On the other hand, the barbaric nations in their turn treated the Greeks as barbarians, and looked upon them as children in philosophy. Plato, in his Timeus, introduces a barbarian as instructing the wife Solon, and saying, "You Greeks are always children; there is not an old man amongst you; you have no such thing as grey-headed wisdom." In this peroration they were the more confirmed, when they understood that the most learned men, and the most ancient philosophers among the Greeks, had either been Barbarians by birth, or instructed by Barbarians (see Clemen. Alex. Stromata, l. i. p. 302, 303.; that Pythagoras, for example, was a Tuscan. Antiphenes a Phrygian, Orpheus a Thracian, Thales a Phoenician; and that Thales, Pythagoras, Plato, and others, had derived their knowledge from Chaldæan and Egyptian priests. Many of the Christian fathers expounded, in this dispute, the cause of the Barbarians, and maintained, with great vehemence, and with all the learning they could command, that the Barbaric philosophy was the fountain of all the wisdom which had appeared among the Greeks, except so far as they had been indebted, in the way of tradition, to divine revelation. This dispute, however, was owing to the want of distinct ideas, and an accurate use of terms; and can in reality be considered as nothing more than a logomachy. For no one can contend that the barbaric nations were wholly inattentive to wisdom, or strangers to every kind of knowledge, human or divine; and, on the other side, it cannot be questioned, that they acquired their knowledge rather by simple reflection than by scientific investigation, and that they transmitted it to posterity rather by tradition than by demonstration. Whereas the Greeks, as soon as they began to be civilized, discovered a general propensity to inquiry, and adopted scientific rules and methods of reasoning. Hence it is easy to perceive, that though the improvement of philosophy is to be ascribed to the Greeks, its origin is to be sought for among the Barbaric nations. Tatian, in Proem. Clem. Alex. Strom. 1. i. p. 302. Orig. adv. Colum. l. i. Brucker's Hist. d. Philosoph. ii. p. 204; Hackert Ant. Phil. Barb. ed. Lind. Bat. 1650.

The Barbaric philosophy, in the most extensive sense of the term, and in its reference to the state of philosophy, from the earliest times to the decline of the Roman republic, comprehends that of the eastern nations, including the Hebrews, Chaldeans, Persians, Indians, Arabs, and Phoenicians; that of the southern nations, or Egyptians and Ethiopians; that of the western nations, to which we may refer the Celts, the Etrurians, and the Romans; and that of the northern nations, including the northern Scythians, Thracians, Getæ, &c. among whom Abaris, Amazanis, Toxaris, and Zamoëtis, obtained the praise of wisdom. See Brucker's Hist. of Philosophy by Enfield, vol. i. Introduction.

BARBARICA, in Entomology, a species of Buprestis, found in Barbary. It is a small insect; colour above brassy; with coppery wings; with annexed very entire and slightly lirate. Fabr. 1775. p. 265.

BARBARICA, a species of Chrysomela, of a brassy-green, with five red lines on the wing-cases; wings fuscous. Inhabit. Barbary. Salzer, Gmelin.

BARBARICARII, in Antiquity, a kind of artist, who, with threads of divers colours, expressed the figures of men, animals, and other things; or, as others describe them, those whose business was to gild and decorate shields and helmets with gold and silver.

The barbaricarii were so called, because they learned this kind of painting from the Phrygians, who were particularly denominated barbarians, in regard of their opposition to the Greeks; though the name is sometimes also written branbaricarii.

BARBARICARII seem also to have been used for soldiers or officers, who wore marks and insignia thus adorned with gold and silver.

BARBARICARII, in Ancient Writers, is used for a military host, raised by the followers on point of engagement. This is called barbaricarum from the barbarians, in whose armies this method of hounding much obtained. The same appellation was given to a war or expedition undertaken against the barbarians.—"Quonque ad ipsum tempus quo barbaricum extorquum eft inter nos & eos." [2]

BARBARICUS was also used for an armoury, or magazine, wherein the Greek emperors kept the spoils and donaries taken from the barbarians in the time of war or peace.

BARBARICUS, in the Materia Medica, is also an appellation given by the modern Greeks to rhubarb. It is thus called from the Sinae Barbaricus, by the way of which this root was first brought to them.

BARBARICUS, in Entomology, a species of Cimex (Reduvius), of a black colour; thorax and wing-cases obtusely ferruginous, and a little white line on the middle of the scutellum. A native of Barbary. Gmelin.

BARBARICUS, in Ornithology, a species of Rallus which inhabits Barbary. It is ferruginous, with a black bill; wings spotted with white; rump white, flecked with black; white below; legs obscure brown. Gmelin. This is the Barbary rail of Latham.

BARBARICUS, a species of Turdus, of a green colour, with the breast spotted with white; rump and tip of the tail

[1] The passage is translated from Latin to English.

BAR

tall yellow. Gmelin. This is the Barlery thryso of La-tham, and grive bofette de Barlary of Buffon. Inhabit Barlary, and is about the fafe of the millet thruf.

BARBARISM, in Grammar, denotes an offence against the purity of style or language.

A barbarism is, according to Iphorus, from a barbarous term, as the former, for influence, is Latin, though corrupt or mutilated; whereas the latter, which this writer calls barbarologia, is a word merely foreign intruded into Latin speech.

In general, under barbarisms are comprehended things written, spoken, declined, or conjugated wrong; or used in a wrong quantity, or in an unusual sense; as when a word is used which is foreign to the language, and not received by the better and purer fort of writers therein. Such are liber for liber, fiella for jeulla, patri for patris, lexi for legi, banus for prosperius, &c.
